SELECTED WATER RESOURCES ABSTRACTS

THE LIBRARY OF THE
APR 23 1970
UNIVERSITY OF ILLINOIS
AT URBANA-CHAMPAIGN

VOLUME 3, NUMBER 7
APRIL 1, 1970

W70-02443 -- W70-02842

LIBRARY U. S. DEPT. OF THE INTERIOR

Selected Water Resources Abstracts is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the Clearinghouse for Federal Scientific and Technical Information (CFSTI) of the Bureau of Standards, U. S. Department of Commerce. It is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U. S. Department of the Interior, Washington, D. C. 20240. Annual subscription is $22.00 (domestic), $27.50 (foreign), single copy price is $3.00. Certain documents abstracted in this journal can be purchased from the Clearinghouse at the prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

LIBRARY U. S. DEPT. OF THE INTERIOR

VOLUME 3, NUMBER 7
APRIL 1, 1970

W70-02443 -- W70-02842

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

Doc.
I 1.94/2:
3/4-6

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources. WRSIC is not presently prepared to furnish loan or retention copies of the publications announced.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas. Centers, and their subject coverage, now in operation are:

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.

- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the FWPCA, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

In cooperation with the Federal Water Pollution Control Administration, the following "centers of competence" have been established:

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.
- Water quality requirements for freshwater and marine organisms at the College of Fisheries of the University of Washington.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

LIBRARY

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

SELECTED WATER RESOURCES ABSTRACTS

01. NATURE OF WATER

1A. Properties

PROTON MAGNETIC RESONANCE SPECTRUM OF POLYWATER,
Princeton Univ., N.J. Dept. of Chemistry.
Gregory A. Petsko.
Science, Vol 167, No 3915, p 171, Jan 9, 1970. 1 p, 1 fig, 4 ref.

Descriptors: *Water structure, *Water properties, *Water analysis, *Nuclear magnetic resonance, *Hydrogen bonding, Analytical techniques, Molecular structure.
Identifiers: Proton magnetic resonance, Polywater.

With the aid of a time-average computer, the proton magnetic resonance spectrum of anomalous water (polywater) is obtained. The spectrum consists of a single broad resonance shifted approximately 300 hertz downfield from the resonance of ordinary water. The spectrum observed may be due to a deshielding by the 'ring current' from the delocalized Pi electrons of the oxygen atoms of the sample, combined with a high degree of hydrogen bonding between molecules, although other explanations are possible. This is in agreement with hexagonal ring structure. (Knapp-USGS)
W70-02617

POLYWATER: PROTON NUCLEAR MAGNETIC RESONANCE SPECTRUM,
Battelle Memorial Inst., Columbus, Ohio; and Maryland Univ., College Park, Dept. of Chemstry.
Thomas F. Page, Jr., Robert J. Jakobsen, and Elis R. Lippincott.
Science, Vol 167, No 3914, p 51, Jan 1970. 1 p, 2 fig, 7 ref.

Descriptors: *Water structure, *Water properties, *Density, *Nuclear magnetic resonance, Spectroscopy, Infrared radiation, Optical properties, Hydrogen bonding, Molecular structure.
Identifiers: Water polymers, Polywater.

In the presence of water, the resonance of the strongly hydrogen-bonded protons characteristic of polywater appears at 5 parts per million lower applied magnetic field than water. Polywater made by a new method confirms the infrared spectrum reported originally. (Knapp-USGS)

NEW TABLES FOR OXYGEN SATURATION OF SEAWATER,
Carnegie Inst. of Tech., Pittsburgh, Pa.; and Massachusetts Inst. of Tech., Cambridge.
E. J. Green, and D. E. Carritt.
Journal of Marine Research, Vol 25, p 140-147, Feb 1967. 1 fig, 3 tab, 14 ref.

Descriptors: *Solubility, *Dissolved oxygen, *Seawater, *Temperature, Chlorides.
Identifiers: *Chlorinity, Green's equation, Saturated solubility of oxygen.

Currently available tables for the calculation of oxygen saturation values of seawater are discussed. New tables of the oxygen solubility (ml/l and ug-at/l), in seawater from a water-saturated atmosphere of which oxygen is 0.2094 mile fraction, excluding water vapor, have been prepared based on Green's equation by machine computation. The vapor pressure of seawater has been computed by combining the Goff-Gratch formulation for the vapor pressure of pure water with a relationship for the vapor pressure lowering by sea salt derived from the data of Arons and Kientzler. The vapor pressure so derived was combined with the Bunsen coefficient to calculate the saturated solubility of oxygen per liter of seawater as a function of temperature and chlorinity. A nomogram for oxygen solubi lity in seawater at equilibrium for laboratory use is added. The values determined for fresh water agree well with those of Klots and Benson and those of Montgomery, Thom, and Cockburn. (Rietveld-Vanderbilt)

02. WATER CYCLE

2A. General

THEORETICAL BASEFLOW CURVES,
Illinois State Water Survey, Urbana. Hydrology Section.
Krishan P. Singh.
ASCE Proc, J Hydraul Div, Vol 95, No HY6, Pap 6905, p 2029-2048, Nov 1969. 20 p, 9 fig, 3 tab, 10 ref, append.

Descriptors: *Base flow, *Surface-groundwater relationships, *Mathematical studies, Groundwater movement, Aquifers, Artesian wells, Streamflow, Evapotranspiration, Hydraulics, Leakage, Recharge.
Identifiers: Base flow curves.

Baseflow curves are obtained by solving a nonlinear partial differential equation of groundwater flow for different boundary conditions. A theoretical basis is provided for differentiating between these curves for shallow and deep aquifers. Various linearized solutions and their limitations and errors are elucidated. Mathematical expressions are derived for the effects of evapotranspiration and leakage loss in substantially reducing the baseflow and rendering the stream influent or dry. Upward leakage from an underlying artesian aquifer causes the baseflow to be more sustained and reduces its recession rate. Aquifer recharge of duration T, simulated by a sine function, leads to a baseflow hydrograph which peaks at 0.75 T and becomes parallel to the no-recharge curve after about 1.5 T. (Knapp-USGS)
W70-02460

INDIRECT EVALUATION OF SOME CHARACTERISTICS OF A HYDROLOGICAL REGIME OF RIVERS UNDER CONDITIONS OF EXCESSIVE MOISTURE (RUSSIAN),
A. M. Komlev.
In: Vodnye Resursy i Vodnoe Khozyaystvo Sibiri (Water Resources and Water Economy of Siberia), Akad Nauk SSSR, Sibirskoye Otdelenie, Geogr Obshchestvo, Novosibirsk, USSR, p 38-46, 1968. 9 p, 2 fig, 1 tab, 9 ref.

Descriptors: *Surface waters, *Hydrologic properties, *Rivers, Meteorology, Vegetation, Bogs, Lakes, Groundwater, Drainage, Forests, Topography, Runoff, River basins, Watersheds (Basins), Geology, Hydrogeology, Underground storage.
Identifiers: *USSR, Siberia, Excessive moisture regimes.

The hydrological characteristics of the Tyumen region of Western Siberia, characterized by excessive moisture and the presence of numerous lakes and bogs, were investigated by evaluating runoff and the distribution and areal extent of lakes, bogs, and forests. These hydrologic characteristics were then analyzed to determine their association, if any, with the coefficients of areal extent of lakes, bogs, and forests. Definite associations exist between these coefficients and the monthly runoffs. (Gabriel-USGS)
W70-02482

DESERTS; THE PROBLEM OF WATER IN ARID LANDS,
London Univ. (England). Inst. of Education
Martin Simons
London, Oxford University Press, 1967. 96 p, 40 fig, 46 plates

Descriptors: Arid lands, Water, Acclimatization, *Water transfer, Climatology, Desalination, Irrigated lands, Saturated soils, Saline soils, Groundwater, Surface waters, Deserts, Desalination processes, Nuclear power plants, Animal physiology, Plant physiology, Plant morphology, Water shortage, Economic efficiency, Arable land, California, Weather modification, Agriculture
Identifiers: *Western U.S., *USSR, Africa, Pakistan, India, Israel, Arabia

The author presents an extensive and well illustrated overview of the problems of arid lands throughout the world. Over a third of the world's land surface is desert or semidesert. The book begins with a brief review of climatic causes and types of arid and semiarid lands of the world. Discussions follow concerning arid lands plants and animals and their morphological and physiological adjustments to the environment. The major part of the book is devoted to discussions of all the possible sources of water known to man that might be used in developing arid lands. Included are explanations of groundwater occurrence and development in many parts of the world. Origins of rivers that flow through arid regions are illustrated with examples from North Africa, Pakistan, India, the Arab States, Israel, South Africa and western U.S. This section closes with a consideration of problems of waterlogging and salinization which occur when irrigation is not combined with adequate drainage. Treatment of water transfer from humid to arid lands is illustrated primarily with examples from California and central USSR. Various processes for desalination of sea water and brackish water and their present and potential applications are reviewed. The author finally raises the question of economic efficiency in committing water developments in arid lands to irrigation rather than to alternative uses such as industrial development. (Crouse-Arizona)

THE ROLE OF SOLID AND LIQUID PRECIPITATIONS IN RUNOFF FORMATION (RUSSIAN),
Akademiya Nauk Kazakhskoi SSR, Alma-Ata. Institut Gidrogeologii i Gidrofiziki.
For primary bibliographic entry see Field 02C.
W70-02654

DETERMINATION OF FLOWS FOR UNGAGED STREAMS,
Washington State Univ., Pullman.
Donald L. Bender.
Completion Report, Washington Water Research Center, Sept 1969. 9 p. OWRR Project A-009-WASH.

Descriptors: *Unit hydrograph, *Runoff simulation, *Laboratory watershed, Rainfall-runoff relationships, Catchments.
Identifiers: *Ungaged streams.

An 8-foot by 16-foot laboratory catchment was used as a hydrologic system to test certain relationships between rainfall and runoff. Unit hydrographs were obtained for a variety of catchment conditions and rainfall intensities and durations. A series of curves for each separate set of rainfall and catchment conditions for one-minute unit hydrographs illustrates that the peak of these unit hydrographs increases until the time of equilibrium is reached. After the time to equilibrium the peaks remain constant and for any given catchment condition the maximum peak discharges of the one-minute unit hydrographs are the same regardless of intensity. Also for a given catchment condition with the duration of rainfall greater than the time to equilibrium, the peak discharges of the total time duration unit hydrographs are the same regardless of intensity. Time to peak on the catchment is related linearly to the time to equilibrium. Kinematic wave formulation is used to express the equation of unsteady flow and a digital computer is used to numerically integrate them. Data from the laboratory catchment is used to verify equations.
W70-02748

GENERALIZED ANALYSIS OF SMALL WATERSHED RESPONSES,
California Univ., Davis.
J. Amorocho.
Available from the Clearinghouse as PB-188 908, $3.00 in paper copy, $0.65 in microfiche. Technical Completion Report WRC No 133, California Water Resources Center, Nov 1969. 5 p, 5 ref. OWRR Project B-005-CAL.

Descriptors: *Small watersheds, *Surface runoff, *Rainfall-runoff relationships, *Model studies, Storm-runoff, Streamflow, Flood prediction, Snowmelt, Demonstration watersheds, Small watersheds.

Several topics were investigated under the general heading 'Generalized Analysis of Small Watershed Responses.' Each topic resulted in a self-contained report, but jointly they contribute to a better understanding of various statistical and physical aspects of small watershed behavior: (1) The functional series representation for nonlinear physical system was used to develop a method permitting the determination of a nonlinear prediction equation and the nonlinear response functions for hydrologic systems. The method was tested successfully using rainfall and stream flow data of a small California watershed. (2) A method of curve fitting was applied to precipitation data of an array of rain gages in a small California watershed to obtain a functional representation of the time and space distribution of storm rainfall. This method may be used for the establishment of criteria for precipitation network design and for the analysis of watersheds as nonlinear systems with distributed input fields. (3) A simple cascade model of the rainfall-runoff process was developed to test whether the design of more complex mathematical models is justified from the standpoint of runoff prediction. (4) A detailed mathematical model of the physical processes producing snowmelt was developed. It is suitable for the prediction of net watershed imputs due to the fusion of snowfields, and may be incorporated into a comprehensive watershed model. (5) A study of the accuracy of the prediction of floods of high return period was conducted. It provided expressions for the standard errors of sample estimates of flood magnitudes corresponding to given return periods for normal and double exponential universes.
W70-02763

2B. Precipitation

SUITABILITY OF THE UPPER COLORADO RIVER BASIN FOR PRECIPITATION MANAGEMENT,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
For primary bibliographic entry see Field 03B.
W70-02622

FREQUENCY ANALYSIS OF RAINFALL INTENSITIES FOR CALCUTTA,
All-India Inst. of Hygiene and Public Health, Calcutta; and Calcutta Metropolitan Planning Organization (India).
V. Raman, and M. Bandyopadhya.
ASCE Proceedings, Journal of the Sanitary Engineering Divsion, Vol 95, No SA6, Paper 6950, p 1013-1030, Dec 1969. 18 p, 10 fig, 9 tab, 7 ref, append.

Descriptors: *Rainfall disposition, *Frequency analysis, *Duration curves, *Depth-area-duration analysis, Rainfall intensity, Probability, Statistical methods, Runoff, Rational formula, Rainfall-runoff relationships, Storm runoff, Storm drains, Drainage engineering.
Identifiers: *Calcutta (India).

Analysis of the point rainfall data in Calcutta, India for 23 yr yields a procedure for arriving at the relationship between the average intensity of excessive rainfall, the corresponding duration the rain continued to fall at the average rate, and the frequency with which these combinations of intensity and duration of such storms occur. Probability methods based on annual maximum events and partial duration series, and methematical and graphical curve fitting, based on frequency analysis, are employed for developing the relationships. Intensity duration frequency relations are expressed in tabular and graphical forms and as mathematical equations. The various methods do not give exactly identical results, and discretion must be used to choose between them for application in the design of a storm sewer system. No particular method can be considered as the best for rainfall frequency determination. (Knapp-USGS)
W70-02634

SOME EXPERIENCE IN EVALUATION OF ATMOSPHERIC PRECIPITATIONS IN THE MOUNTAINS OF TRANSILIAN ALA TAU (RUSSIAN),
Akademiya Nauk Kazakhskoi SSR, Alma-Ata. Institut Gidrogeologii i Gidrofiziki.
Ye. P. Mansurova, and I. S. Sosedov.
Gidrofizicheskie Issledovaniya v Gornykh Rajonakh Kazakhstana Akad Nauk Kazakhskoi SSR, Trudy Instituta Gidrogeologii i Gidrofiziki, Vol 2, p 3-18, 1969. 6 fig, 6 tab, 14 ref

Descriptors: *Precipitation (Atmospheric), *Mountains, Moisture content, Humidity, Winds, Instrumentation, Mathematical studies, Analytical techniques, Snow, Evaporation, Hydrologic data, Seasonal, Altitude.
Identifiers: *USSR, Transilian Ala Tau (Kazakh SSR).

The errors in measurements of atmospheric precipitation are analyzed. A method is given for interpolating corrected values of seasonal and annual precipitation. This interpolation is based on an empirically derived relationship between gaging station altitudes and atmospheric precipitation. (Gabriel-USGS)
W70-02650

RESULTS OF ATMOSPHERIC CIRCULATION STUDIES OVER EUROPE, ASIA, AND THE ARCTIC BY RADAR-METEOR TECHNIQUE (RUSSIAN),
Institute of Experimental Meteorology (USSR).
I. A. Lysenko, B. L. Kashcheyev, K. A. Karimov, M. K. Nazarenko, and A. D. Orlyansky.
English summary. Izvestiya Akademii Nauk, SSSR, Seriya Fiziki Atmosfery i Okeana, Vol 5, No 9, p 893-902, Sept 1969. 4 fig, 3 tab, 21 ref.

Descriptors: *Atmosphere, *Atmospheric pressure, *Air circulation, *Arctic, *Meteorites, Radar, Winds, Air masses, Anticyclones, Cyclones, Instrumentation, Measurement, Frequency analysis, Wavelengths, Model studies.
Identifiers: *USSR, Atmospheric circulation, Meteorological radar.

The results of synchronous measurements of the wind regime in the meteor zone are given on the basis of observations recorded from September 1965 to February 1966 in Kharkov, Obninsk, Kiev, Frunze Dushanbe, Tomsk, and on Hayes Island. On the basis of these data the cyclonic or anticyclonic character of prevailing air-mass motions in the meteor zone over Europe, Asia, and the Arctic is identified. (Gabriel-USGS)
W70-02655

ATTAINABLE ACCURACY OF LINEAR STATISTICAL FORECASTING AND OPTIMAL DIMENSIONS OF THE PREDICTOR (RUSSIAN),
A. S. Marchenko.
English summary. Investiya Akademii Nauk, SSSR, Seriya Fiziki Atmosfery i Okeana, Vol 5, No 9, p 883-892, Sept 1969. 1 tab, 7 ref.

Descriptors: *Forecasting, *Meteorology, *Statistical methods, *Hydrologic aspects, *Sampling, Hydrology, Mathematical studies, Analysis, Parametric hydrology, Equations, Atmosphere, Atmospheric pressure, Air temperature.
Identifiers: Forecasting statistics, Sampling statistics.

Forecast efficiency is investigated by means of the multiple regression equation taking into account the fact that a limited number of observations is used for evaluation of extrapolational parameters. The results are obtained on the assumption that the vector, composed of the predictor and predictant, is distributed normally and that extrapolational parameters are evaluated on the basis of the sampling of independent observations. The expected r.m.s. error is calculated theoretically from independent data, statistic hypotheses on its numerical value are formulated, and criteria for the test of the hypotheses are indicated. It is shown that there exists an optimal predictor dimension guaranteeing highest accuracy of extrapolation. (Gabriel-USGS)
W70-02656

LOCAL MOISTURE AND PRECIPITATION,
Nevada University, Reno. Center for Water Resources Research.
Charles K. Stidd.
Desert Research, Institute Preprint Series No 45, Nevada University, July 1968. 39 p, 5 fig, 26 ref, append. OWRR Proj B-008-Nev.

Descriptors: *Precipitation (Atmospheric), *Precipitable water, Evapotranspiration, *Meteorology, Water balance, Hydrologic budget, Climatology, Water resources development, Atmospheric physics, Air masses, Humidity, Hydrologic cycle, Weather.
Identifiers: Local moisture availability.

Evidence is presented to show that moisture evaporated or transpired from local soils and plants is important to the precipitation process. The evidence includes a seasonal water balance f or that portion of the world lying north of 30 deg N Latitude showing a reversal of the hydrologic cycle during the summer half-year, a discussion of annual cycles of precipitation in the United States showing the importance of local moisture to climate, a demonstration of the mechanism by which locally derived moisture can produce an unstable atmosphere leading to shower activity, and a statistically significant verification of an increase in summer rainfall associated with the Columbia Basin Irrigation Project. (Knapp-USGS)

GLACIAL DRAINAGE DIVIDE IN THE SKAGIT VALLEY, WASHINGTON,
Geological Survey, Spokane, Wash.
Paul L. Weis.
Geological Survey Research 1969, Professional Paper 650-C, p C71-C74, 1969. 4 p, 4 fig, 1 ref.

Descriptors: *Watersheds (Divides), *Pleistocene epoch, *Glaciation, *Geomorphology, *Washington, Drainage systems, Rivers, Interfluves, Glacial drift, Erosion.
Identifiers: Skagit Valley (Wash), Glacial drainage divide, Pleistocene drainage patterns.

Major valleys in the western part of the North Cascades primitive area have been intensely glaciated and characteristically have U-shaped cross sections, steep walls, flat floors, and relatively gentle gradients. A notable exception is the Skagit Valley, which has a segment about 7 miles long with a steep gradient and the V-shaped cross section characteristic of stream erosion. The valley upstream and downstream from the V-shaped gorge has the typical U-shaped cross section of a glaciated valley. This anomalous section of the Skagit Valley may best be explained by the hypothesis that it was a drainage divide during late Pleistocene time and was occupied by relatively stagnant ice. (Knapp-USGS)

RIVER ICE JAMS - A LITERATURE REVIEW,
United States Lake Survey, Detroit, Mich.
S. J. Bolsenga.
Corps Eng Lake Survey Res Rep 5-5, June 1968. 568 p, 35 fig, 430 ref.

Descriptors: *Ice jams, *Rivers, *Reviews, *Bibliographies, *Surveys, Water level flucuations, Floods, Melting, Frazil ice, Freezing, Slush, Ice, Ice breakup, Navigation, Flood control, Flood protection.
Identifiers: River ice jams, Ice floods.

About 400 published studies of river ice jams in many areas of the world were collected, examined, listed, and summarized. Both current and historical information on the ice jam mechanism and methods of prevention and removal are included. Descriptions of ice jam characteristics range from mathematical to narrative treatments. Methods of prevention and removal range from dusting and thermal pollution to the more widely used blasting. Trends in the use of these techniques are discussed. Lack of success in applying prevention and removal techniques is often caused by lack of basic information on ice jam characteristics. The results of this report can be useful in field operations, and a guideline for future research planning is provided. (Knapp-USGS)
W70-02494

SUPERDENSE WATER ICE,
Toledo Univ., Ohio. Ritter Astrophysical Center.
A. H. Delsemme, and A. Wenger.
Science, Vol 167, No 3914, p 44-45, Jan 1970. 2 p, 1 tab, 10 ref.

Descriptors: *Ice, *Water properties, *Water structure, Freezing, Density, Mechanical properties, Physical properties, Vapor pressure.
Identifiers: Amorphous ice.

A new allotropic form of water ice with a density of 2.32 plus or minus 0.15 grams per cubic centimeter has been observed at very low pressures and for temperatures lower than 100 deg K. It is most likely amorphous. Distilled water was outgassed, weighed, and conducted to an introduction chamber where it vaporized. The residual pressure of the water vapor in the main chamber was maintained at 0.0001 mm-Hg or less. The main chamber was then cut off from the vacuum pump and checked for leaks. Water vapor was introduced through a valve at a selected rate. During condensation, the pressure was maintained at 6 to 8 x 0.001 mm-Hg in the main chamber by controlling the rate of introduction of water vapor. At temperatures near or below 100 deg K, a new form of ice with very high density was produced. It does not seem that polywater, which solidifies at -40 deg C into a glasslike state, can be directly connected with our observations. (Knapp-USGS)
W70-02619

STALACTITE GROWTH BENEATH SEA ICE,
Naval Ship Engineering Center, Port Hueneme, Calif. Port Hueneme Div.
Russell A. Paige.
Science, Vol 167, No 3915, p 171-172, Jan 9, 1970. 2 p, 1 fig, 7 ref.

Descriptors: *Sea ice, *Brines, *Freezing, Water chemistry, Density, Density currents, Sea water.
Identifiers: Ice stalactites.

Fresh ice stalactites were observed beneath sea ice in Antarctica. They are hollow, tapering, inverted cones having a base diameter between 10 and 20 centimeters and a tip diameter of 4 to 10 cm extending downward about 100 cm. The stalactites form when dense, chilled brine drains downward from the ice sheet into seawater of normal salinity and near-freezing temperature. (Knapp-USGS)
W70-02620

A METHOD FOR THE DETERMINATION OF SNOW RESOURCES IN A MOUNTAIN BASIN (RUSSIAN),
Akademiya Nauk Kazakhskoi SSR, Alma-Ata. Institut Gidrogeologii i Gidrofiziki.
I. S. Sosevdov, and L. N. Filatova.
Gidrofizicheskie Issledovaniya v Gornykh Raionakh Kazakhstana Akad Nauk Kazakhskoi SSR, Trudy Instituta Gidrogeologii i Gidrofiziki, Vol 2, p 19-26, 1969. 4 fig, 2 tab, 8 ref.

Descriptors: *Snow, *Snowmelt, *Mountains, Mapping, Altitude, Slopes, Seasonal, River basins, Watersheds (Basins), Forests, Landslides.
Identifiers: *USSR, Alatau.

Water resources from snowmelt were investigated using a statistical method and observational data of snow thicknesses recorded in the Transilian Alatau. Snow water reserves can be predicted on the basis of snow thickness, altitude, and latitude parameters. (Gabriel-USGS)
W70-02649

SEASONAL FREEZING AND ITS HYDROLOGICAL EFFECT UNDER THE CONDITIONS OF THE NORTHERN SLOPE OF THE TRANSILIAN ALA TAU (RUSSIAN),
Akademiya Nauk Kazakhskoi SSR, Alma-Ata. Institut Gidrogeologii i Gidrofiziki.
V. A. Sazonov, and I. S. Sosedov.
Gidrofizicheskie Issledovaniya v Gornykh Raionakh Kazakhstana Akad Nauk Kazakhskoi SSR, Trudy Instituta Gidrogeologii i Gidrofiziki, Vol 2, p 94-100, 1969. 2 fig, 1 tab, 12 ref.

Descriptors: *Seasonal, *Freezing, *Soils, *Hydrologic properties, *Mountains, Ice, Soil water, Capillary action, Snow, Snow cover, Air temperature, Altitude, Vegetation, River basins.
Identifiers: *USSR, Transilian Ala Tau.

Seasonal regime of soil freezing, as a function of air temperature, altitude and geographical location, was investigated in the Transilian Ala Tau. Seasonal freezing of soil at altitudes of 3,000 to 3,200 m where the seasonal freezing is in contact with permafrost, strongly affects the formation of runoff, floods, and mud streams associated with the floods. The effects of air temperature and snow cover on the depth of freezing are given. (Gabriel-USGS)

THE ROLE OF SOLID AND LIQUID PRECIPITATIONS IN RUNOFF FORMATION (RUSSIAN),
Akademiya Nauk Kazakhskoi SSR, Alma-Ata. Institut Gidrogeologii i Gidrofiziki.
I. S. Sosedov.
Gidrofizicheskie Issledovaniya v Gornykh Raionakh Kazakhstana Akad Nauk Kazakhskoi SSR, Trudy Instituta Gidrogeologii i Gidrofiziki, Vol 2, p 101-109, 1969. 2 fig, 2 tab, 10 ref.

Descriptors: *Precipitation (Atmospheric), *Rain, *Snow, *Runoff, *Surface runoff, Erosion, Water supply, Water balance, Slopes, Seasonal, Mathematical studies, Soil water, Rain gages, Snow cover, Snowmelt, Altitude.
Identifiers: *USSR, Transilian Ala Tau.

Sources of surface runoff were investigated on the basis of a water balance equation in the Transilian Ala Tau region. Evaluation of the effects of altitude, snow cover, geographical location, vegetation, and slope orientation yields coefficients of runoff formed by solid (snow) and liquid (rain) precipitation. (Gabriel-USGS)

SCATTERING AND ATTENUATION OF RADIATION BY WATER-FILMED HAIL (RUSSIAN),
M. T. Abshayev, and V. I. Rozenberg.
Izvestiya Akademii Nauk, SSSR, Seriya Fiziki Atmosfery i Okeana, Vol 5, No 9, p 973-978, Sept 1969. 6 fig, 10 ref.

Descriptors: *Hail, *Atmosphere, *Radiation, *Attenuation, Clouds, Rain meteorological data, Meteorology, Ice, Mathematical models, Temperature, Water temperature, Films, Wavelengths, Radiosondes.
Identifiers: Radiation scattering.

Attenuation and scattering of radiation from hail was analytically investigated by assuming the temperature of the ice spheres and the water films to be 0 deg C. Several curves show the effect of ice sphere radius and water film thickness on the transversal cross-section of total attenuation and scattering. (Gabriel-USGS)

WATER REQUIREMENTS OF LAWNGRASS,
Nevada Agricultural Experiment Station, Reno, and Agricultural Research Service, Amex, Iowa. Soil and Water Conservation Research Div
Rhys Tovey, John S. Spencer, and Dean C. Muckel.
American Society of Agricultural Engineers, Transactions, Vol 12, No 3, p 356-358, 1969. 4 tab, 2 fig, 8 ref.

Descriptors: *Arid lands, *Lawns, *Water requirements, *Irrigation efficiency, *Evapotranspiration, Semiarid climates, Nevada, Irrigation design, Lysimeters, Evaporation pans, Solar radiation, Estimating equations, Heat budget, Soil moisture, Root zone, Soil-water-plant relationships, Soil moisture meters, Water conservation, Water management (Applied).

Knowledge of lawngrass water requirements is valuable since substantial amounts of water are often used in irrigation in arid and semiarid climates. Measured or estimated evapotranspiration is basic to irrigation system design and proper scheduling of irrigation. The authors report experiments performed near Reno, Nevada, to determine water requirements of lawngrass. The studies were conducted on lysimeters using a mixture of Kentucky Bluegrass, fescues and white clover. Water applied at each irrigation and effluent pumped from the lysimeters were measured. Soil moisture conditions were monitored, evaporation and net radiation measured and evapotranspiration calculated. Data and visual observations from studies continued over three seasons showed that twice weekly irrigations on sandy loam soil and weekly irrigations on loam soil maintained lawngrass with good appearance and healthy root development during the hot part of the growing season. Significant relationships were found between evapotranspiration estimates by the Penman and Olivier methods and measured evapotranspiration from lawngrass. The authors suggest that Blaney-Criddle coefficients may be useful in estimating irrigation requirements for lawngrass in other areas. (Crouse-Arizona)

TOTAL SUMMER EVAPORATION IN THE CENTRAL MOUNTAIN BELT OF TRANSILIAN ALATAU AND THE EFFECT OF SLOPE EXPOSURE ON EVAPORATION (RUSSIAN),
Akademiya Nauk Kazakhskoi SSR, Alma-Ata. Institut Gidrogeologii i Gidrofiziki.
I. S. Sosedov, and L. N. Filatova.
Gidrofizicheskie Issledovaniya v Gornykh Raionakh Kazakhstana Akad Nauk Kazakhskoi SSR, Trudy Instituta Gidrogeologii i Gidrofiziki, Vol 2, p 67-80, 1969. 5 fig, 5 tab, 6 ref.

Descriptors: *Evaporation, *Seasonal, *Mountains, *Slopes, Humidity, Infiltration, Soils, Soil physical properties, Fissures (Geology), Runoff, Instrumentation, Sprinkling, Filtration, Altitude, Vegetation, Water balance.
Identifiers: *USSR, Transilian Alatau, Summer evaporation.

Evaporation data recorded in the mountain belt of Transilian Alatau during snow-free and warm periods are analyzed on the basis of soil variation, altitude, vegetation cover, air temperature, and some hydrometeorological parameters. The study suggests the use of a logarithmic formula for the evaluation of the total monthly evaporation. Some relationship is present between the evaporation intensities and air temperatures. (Gabriel-USGS)

THE EFFECT OF THE ADDITION OF HEAT FROM A POWERPLANT ON THE THERMAL STRUCTURE AND EVAPORATION OF LAKE COLORADO CITY, TEXAS,
Geological Survey, Washington, D.C. Water Resources Div
G. E. Harbeck, Jr., G. E. Koberg, and G. H. Hughes.
Studies of Evaporation, Geological Survey Professional Paper 272-B, Washington, 1959. 49 p, 11 tab, 21 fig, 16 ref.

Descriptors: *Evaporation, *Lakes, *Heat balance, Thermal powerplants, Cooling, Energy budget, Heat budget, Reservoirs, Temperature, Solar radiation, Mass transfer, Circulation, Water utilization, Climatology, Humidity, Weather data, Vapor pressure, Thermal properties.

Lake Colorado City is used as a source of cooling water for a thermal-electric-powerplant. Evaporation from the lake was determined by the energy-budget method for the period July 1954 to October 1955. Analyses indicate that if no heat had been added by the powerplant, the water-surface temperature would have been only 0.8 deg C lower than that observed. The temperature rise is almost directly proportional to the heat input. The increase in evaporation from Lake Colorado City, when expressed as a volume, is directly proportional to the amount of heat added and is practically independent of reservoir content. The entire lake is being effectively utilized in disposing of heat. Water temperatures in the lower basin of the lake were higher in winter than those in the upper basin of the lake; no appreciable differences were observed in summer. Density differences between the two parts of the lake were very small at all times. A comparison between average lake temperatures and plant intake water temperatures indicates that water is withdrawn from all levels of the lake above the pump intakes. The average withdrawal temperature to be expected, if the amount of heat added by the powerplant is increased, probably will be about equal to the anticipated surface temperature, which can be determined from graphs in the text. (Novotny-Vanderbilt)

MEASUREMENT OF EVAPOTRANSPIRATION IN LOWLAND VEGETATION,
Mayard E. Bates, and Murray F. Buell.
New Jersey Academy of Science, The Bulletin, Vol 14, No 1-2, Spring-Fall 1969, Jan 2, 1970. 12 p. OWRR Project B-006-NJ.

Descriptors: *Evapotranspiration, *Swamp, Evaporation, Phreatophyte, Shrubs, Transpiration.
Identifiers: *Pine Forest, *Lowland vegetation, Evapotranspirometer.

Instrumentation is described whereby the evapotranspiration from bog vegetation can be measured under natural conditions. The instrumentation is automatic, measuring the input and output of water of a system necessary to maintain the same water table within as that prevailing outside the system. The system consists of a six foot square tank containing a unit of vegetation sunk into a bog of the same vegetation and monitored by a pumping and measuring station. The latter is connected through an underground pipe to an irrigation system in the bottom of the tank. The specific environment in the New Jersey Pine Barrens for which it is designed is described. The questions concerned with the Pine Barrens vegetation under relations which it is expected to answer are discussed.

FLOW BELOW DEEPLY SUBMERGED RECTANGULAR WEIRS,
Alberta Univ., Edmonton. Dept. of Civil Engineering.
N. Rajaratnam, and D. Muralidhar.
J Hydraul Res, Vol 7, No 3, p 355-374, 1969. 20 p, 13 fig, 2 tab, 8 ref.

Descriptors: *Open channel flow, *Weirs, Discharge (Water), Supercritical flow, Critical flow, Turbulent flow, Vortices, Turbulence, Jets
Identifiers: *Submerged flow, *Submerged weirs.

Flow over weirs submerged more than 90% was studied in a laboratory flume. The vena contracta occurs at a distance of about 1.0 t from the weir where t is the tailwater depth above the crest and the coefficient of contraction is about 0.74. Beyond the vena contracta, there is a flow development region of length equal to about 2 t. Beyond the end of the potential core, the fully developed flow region has been found to be essentially the same as a half turbulent free jet, with some difference in the growth of the length scale. The length of the eddying region or standing eddy was studied using dimensional analysis and the experimental results. A simple discharge equation was developed to predict the discharge over submerged rectangular weirs when the submergence ratio is greater than about 90%. (Knapp-USGS)

AIR ENTRAINMENT BY FLOWING WATER UNDER REDUCED ATMOSPHERIC PRESSURE,
Engineering Labs., Cambridge (England).
A. M. Binnie, and G. P. Sims.
J Hydraul Res, Vol 7, No 3, p 279-299, 1969. 21 p, 10 fig, 16 ref.

Descriptors: *Closed conduit flow, *Air entrainment, *Hydraulic models, Model studies, Aeration, Bubbles, Cavitation, Spillways, Siphons, Pipelines, Water conveyance.
Identifiers: Reduced air pressure.

A circular water tank, with a vertical pipe as overflow, and a small siphon-spillway drawing from a

reservoir were placed in turn in a decompression chamber. At ambient pressures down to 2 inches Hg absolute, measurements were made of the water and air discharges at various supply levels. The reduction of ambient pressure had two consequences: (1) the air flow was also reduced; (2) the onset of cavitation in the vertical-pipe apparatus was facilitated. In the siphon, cavitation did not occur. In both sets of apparatus the reduction of ambient pressure H had no noticeable effect on the relation between the head and the water discharge, although the air discharge was lessened. (Knapp-USGS)

FLOODS OF JUNE 1, 1967 IN SOUTHWESTERN JACKSON, MISSISSIPPI,
Geological Survey, Jackson, Miss. Water Resources Div.
Kenneth V. Wilson.
Geological Survey Open-file Report, Sept 1968.

Descriptors: *Floods, *Mississippi, *Rainfall intensity, *Urbanization, Discharge (Water), Stage-discharge relations, Hydrographs, Profiles, Mapping, Hydrologic data, Data collections.
Identifiers: Jackson (Miss).

An intense rainfall of 2 to 4 inches on June 1, 1967, most of it falling within 1 hour, caused unusual flooding in southwestern Jackson, Mississippi. The frequency of this rainfall at the U.S. Corps of Engineers Waterways Experiment Station near Clinton exceeded 25 years for periods less than 1 1/2 hours. The frequency flooding of Hardy Creek was greater than 50 years at McDowell Road and dissipated to about 10 years at Terry Road. The frequency of flooding of Cany Creek exceeded once in 50 years at Raymond Road but was only a 10-year flood at Cooper and Terry Roads. Baker Creek, which drains from the extreme western part of Jackson, flooded Spring Ridge Road to considerable depths. The frequency of this flood on Baker Creek was about 17 years. (Knapp-USGS)

FLOODS IN TRIPLETT CREEK IN VICINITY OF MOREHEAD, KENTUCKY,
Geological Survey, Washington, D.C.
C. H. Hannum.
Geol Surv Hydrologic Investigations Atlas HA-342, 1 sheet, 1969. Text, 7 fig, 1 map, 2 photo, 3 ref.

Descriptors: *Floods, *Kentucky, *Data collections, *Hydrologic data, Mapping, Streamflow, Stage-discharge relations, Flood damage, Flood plains, Flood control, Non-structural alternatives, Maximum probable flood.
Identifiers: *Morehead (Ky), Triplett Creek.

Hydrologic data that can be used to evaluate the extent, depth, and frequency of floods of Triplett Creek, Morehead, Kentucky are presented in a 1-sheet hydrological atlas consisting of a map, photographs, profiles, cross sections, graphs, and text. The data are a technical basis for solving flood plain problems and formulating land use regulations to reduce future damages. Areas that would be flooded by 5-, 25, and 50-year floods are shown on a 1:12,000 topographic map. Past floods and recurrence intervals are plotted on graphs. Cross sections and profiles show flood depths at selected locations. (Knapp-USGS)

Identifiers: *Hurricane Camille (1969), Logtown (Miss), Tidal floods, Storm tides.

The areas flooded by Hurricane Camille tides of August 18, 1969 along the Mississippi Gulf Coast are shown in a series of hydrologic atlases. The Atlas of the Logtown quadrangle shows flooded areas on a topographic map scaled 1:24,000. Camille was the most intense hurricane on record to enter the U. S. mainland. Estimated maximum winds were 190 mph, and the central pressure was 26.61 inches of mercury. The eye of the storm, traveling about due north, passed over the Waveland-Bay St. Louis area and winds of over 75 mph extended about 50 mi on each side. Maximum precipitation was 10 inches. Flooding was most severe in the Pass Christian area where tides reached 25 ft above msl. High tide frequency and annual maximum tide are shown by graphs. (Knapp-USGS)

FLOODS IN MISSISSIPPI-SEPTEMBER 1965 THROUGH SEPTEMBER 1967,
Geological Survey, Jackson, Miss.
B. E. Wasson.
Mississippi State Board of Water Commissioners Bulletin 69-1, June 1969. 31 p, 8 fig, 1 tab, 3 ref.

Descriptors: *Floods, *Mississippi, *Streamflow, *Rainfall, Rainfall-runoff relationships, Hydrologic data, Data collections, Storms, Hurricanes, Rain, Tides, Waves (Water), Winds.
Identifiers: Mississippi floods (1965-1967).

Several locally severe floods occurred in Mississippi in the period September 1965-September 1967. On September 10, 1965, a tidal wave caused by Hurricane Betsy was responsible for much damage along the western half of the Mississippi gulf coast. Extreme floods occurred February 10, 1966, on streams draining between 10 and 200 sq mi in a relatively narrow area of heavy rainfall between Vicksbury and New Albany. General but less severe flooding occurred in the central and southern parts of the State between February 9-17. During the last half of April 1966 two storm periods caused heavy rain in central Mississippi and unusual floods in the southwestern part of the State. The floods of April 13-15, 1967, in southwestern Mississippi were unusual but not as high as the floods of October 4, 1964. On June 1, 1967, a cloudburst rain caused 50-yr or greater floods on small-drainage areas in southwestern Jackson. Another small-area rain caused 50-yr or greater floods on small streams near Hickory Flat on July 9, 1967. Rainfall as great as 13 inches in 24 hr along the Mississippi gulf coast on September 6, 1967, caused no record floods. (Knapp-USGS)

CALCULATION OF SLOPE STABILITY OF RIVERS AND DRAINAGE CANALS (RUSSIAN),
A. F. Pechkurov.
Gidrotekhnika i Melioratsiya, No 9, p 61-73, Sept 1969. 7 fig, 4 tab.

Descriptors: *Slope stability, *Slopes, Rivers, Drainage, Canals, River beds, Bogs, Marshes, Mathematical studies, Gravity, Seepage, Friction, Climates, Freezing, Geology, Porosity, Peat, Runoff, Hydraulic properties, Floods, Erosion.
Identifiers: *USSR, Canal bank stability.

Slope stability calculations are based on the ultimate equilibrium of soil surfaces, the behavior of groundwater and streamflow, the structural and molecular cohesion of earth particles under water, and friction. Several slope stability observations were recorded on many rivers and streams of the USSR under various conditions of slope soil moisture and composition. The applicability of porous concrete plates of various thicknesses is demonstrated for improvement of slope stability of rivers and drainage canals. (Gabriel-USGS)

BIG BLACK RIVER, MISSISSIPPI COMPREHENSIVE BASIN STUDY - ANNEX F. GEOLOGY AND WATER RESOURCES,
Geological Survey, Jackson, Miss. Water Resources Div.
B. E. Wasson
Big Black River Basin Coordinating Committee Rep, Vol 4, Annex F, Apr 1968. 43 p, 13 fig, 4 tab, 33 ref

Descriptors: *Water resources, *Surface waters, *Groundwater, *Mississippi, Streamflow, Aquifers, Water quality, Water yield, Water wells, Hydrologic data, Data collections, Water resources development
Identifiers: *Big Black River (Miss)

Abundant supplies of water of good quality are available in the Big Black River basin, Mississippi, from either groundwater or surface water sources. For 90% of the time flow in the lower part of the Big Black River below Pickens is not less than 85 cfs. Chemical quality of water in the streams is excellent, except for impairment caused by pollution at several places. Most of the available groundwater is contained in 6 geologic units from 100 to 1,000 ft thick. The aquifers overlap to the extent that a well drilled to the base of fresh water will in most places penetrate two or more aquifers. Well depths range from less than 10 to 2,400 ft. Water suitable for most needs can be obtained from the aquifers available at most localities. Shallow groundwater (less than 200 ft deep) in the basin usually contains about 100 ppm of dissolved solids. Most water in the basin from more than 2,500 ft below land surface contains more than 1,000 ppm of dissolved solids. Practically all water used in the basin is from the ground (about 11 mgd); however, a small amount of surface water is used for supplemental irrigation of row crops. Most of the area is underlain by one or more aquifers from which a properly constructed well could produce as much as 2,000 gpm. All the towns in the area have sufficient g roundwater available to at least double or triple their groundwater pumpage. (Knapp-USGS)
W70-02672

JETS WITH NEGATIVE BUOYANCY IN HOMOGENEOUS FLUID,
Waterloopkundig Laboratorium, Delft (Netherlands).
Gerrit Abraham.
Journal of Hydraulics Research, Vol 5, No 4, p 235-248, 1967. 1 tab, 3 fig, 9 ref.

Descriptors: *Jets, *Buoyancy.
Identifiers: *Entrainment, Flow pattern.

This study analyzes the flow pattern of a jet issuing vertically upwards into a lighter homogeneous ambient fluid and the decrease of the vertical flux of tracer near the ceiling level is taken into consideration to determine the coordinate of the ceiling level. Only three-dimensional axisymmetrical jets are considered. The author analyzes two zones: (a) zone with positive entrainment, near the orifice and (b) zone with negative entrainment, near the ceiling level, and gives mathematical solutions for both cases. A comparison between previously published theories and experimental data was made. The position of the ceiling level fluctuates with time when making a comparison between the present theory and previously published theories. Also, the present theory gives higher values of the coordinate of ceiling level than found by Morton and by Priestley and Ball. The experiments confirm that the present theory gives the ceiling level when it is high and that the solution of Morton gives the ceiling level when it is low; but both theories are of equal practical significance. The theory of Priestley and Ball gives the ceiling level when it is high, contrary to expectations. (Guerrero-Vanderbilt)

FUTURE OF GROUND WATER IN AFRICAN SAHARA DESERT,
Alexandria Univ. (Egypt). Faculty of Engineering.
H. Y. Hammad.
ASCE Proc, J Irrig and Drainage Div, Vol 95, No IR4, Pap 6986, p 563-580, Dec 1969. 18 p, 7 fig, 7 tab, 11 ref, append.

Descriptors: *Water resources development, *Arid lands, Water wells, Pumping, Recharge, Mathematical studies, Water supply, Discharge (Water), Water storage, Irrigation, Irrigation water, Aquifers.
Identifiers: Sahara Desert, Oases.

The two-dimensional problem of unsteady seepage flow through a confined sand bed of vast plan area is attempted on mathematical lines. The treatment is applied to the groundwater reservoir lying under the vast African Sahara Desert with the object of determining the amount of recharge to this aquifer as well as the amount of its storage. The future groundwater discharges of two main oases in Egypt (namely Kharga and Dakhla) have been predicted to the year 2000. The free flow discharge of Kharga Oasis at present can irrigate a cultivated area of about 10,000 acres, the corresponding area of Dakhla Oasis being 22,000 acres. The installation of pumps in Kharga wells increases their discharge by about 15% and those of Dakhla by about 7%. Owing to various complications in the pump installation, and the low water gain obtained by them, pumps should not be used. Their expenses far exceed the water gain. (Knapp-USGS)
W70-02452

NONLINEAR FLOW IN POROUS MEDIA BY FINITE ELEMENTS,
Townsville Univ. Coll. (Australia). Dept. of Civil Engineering.
Raymond E. Volker.
ASCE Proc, J Hydraul Div, Vol 95, No HY6, Pap 6927, p 2093-2114, Nov 1969. 22 p, 6 fig, 3 tab, 35 ref, append.

Descriptors: *Groundwater movement, *Mathematical models, Hydraulic models, Piezometry, Dupuit-Forchheimer theory, Numerical analysis, Porous media, Discharge (Water), Equations.
Identifiers: Nonlinear groundwater flow.

Two commonly suggested forms of the equations linking head loss and velocity for flow of water through coarse granular media are the Forchheimer and exponential relations. Combined with the continuity expression, these relations give the differential equations applicable, within the limits of validity of the parent relations, to actual regions of flow. The resultant nonlinear partial differential equations are amenable to solution by the numerical technique known as the method of finite elements. This technique has advantages when dealing with complex boundary shapes. Solutions have been obtained for some examples of unconfined flow with boundary conditions similar to those likely to be encountered in practical applications. Experimental work in an open flume has shown that agreement between observed and calculated values of discharge and piezometric head can be obtained when the coefficients in the head loss equations are accurately known. Identifiers: *Nonlinear flow (Porous media).

Many investigators are concerned about the validity of the Forchheimer equation which represents the relationship between the velocity of flow and pressure gradient in porous media. A theoretical development of this equation through analysis of the dimensionless form of the Navier-Stokes equation is presented. It shows that energy losses at high-flow velocities in porous medium are a result of convective acceleration effects, not turbulent effects. In addition, two dimensionless terms representing the flow behavior are defined and evaluated. It is shown that a constant could be used to represent the geometric properties of the medium and that a characteristic length representative of the flow exists. Both of these quantities are easily evaluated through hydraulic measurements of gradients and flow velocities. Experimental data from many sources were used to evaluate the theoretical results. Identifiers: *USSR.

Hydrodynamic movement nets of groundwater flow to water wells were analytically investigated and the results were compared with available experimental data. Use of various published formulas give similar results which are comparable with results obtained by the use of experimental data. Variations of gradients, even of considerable magnitudes, do not effect the discharge values of water wells. It is of interest to note that experimental studies using flumes give a correct picture of groundwater movements toward water wells. (Gabriel-USGS)

GEOLOGY AND GROUNDWATER RESOURCES OF CASS COUNTY, NORTH DAKOTA: PART 3,
Geological Survey, Bismark, N. Dak.
Robert L. Klausing.
North Dakota Geological Survey Bull 47 and State Water Commission County Ground Water Studies 8, 1968. 77 p, 24 fig, 2 plate, 2 tab, 29 ref, append.

Descriptors: *Water resources, *Groundwater, *North Dakota, Water wells, Aquifers, Glacial drift, Water quality, Water yield, Hydrologic data, Data collections, Water levels, Hydrogeology, Stratigraphy.
Identifiers: *Cass County (N Dak).

Location and extent of the various sources of groundwater in Cass County, N. Dak. and the chemical quality of the water available from each source are described. The potential of each groundwater source for future development is evaluated. Important sources of groundwater are the sand and gravel deposits in the glacial drift and sand and sandstone beds in the Dakota Sandstone. The West Fargo aquifer, which underlies about 110 sq mi in southeastern Cass County, is the most permeable and productive aquifer in the county. It also is the most heavily pumped aquifer, and water-levels have declined seriously in the West Fargo and surrounding areas. Quality of the groundwater from major drift aquifers differs considerably from place to place. Generally the water is suitable for domestic and stock use, and some of the water is suitable for irrigation. Dissolved-solids concentration from the 7 aquifers ranges from about 380 ppm to about 1,560 ppm. The Cretaceous Dakota Sandstone is the only bedrock unit in the county that is known to yield water to wells. Dakota Sandstone water is highly mineralized and unsuitable for most uses except stock. The water has dissolved-solids concentrations ranging from about 2,600 to about 4,000 ppm. (USGS)

RELATION OF BEDROCK FRACTURE SYSTEMS TO UNDERGROUND WATER SUPPLIES IN THE STAFFORD SPRINGS, SOUTH CONVENTRY, SPRING HILL, AND WESTFORD QUADRANGLES,
Connecticut Univ., Storrs.
Janet M. Aitken.
Available from the Clearinghouse as PB-188 932, $3.00 in paper copy, $0.65 in microfiche. Research Project Completion Report, Dec 1969. 7 p, 8 fig, 1 append. OWRR Project A-004-CONN.

Descriptors: *Structural geology, Seismology, *Groundwater movement, Seismic properties, *Connecticut.
Identifiers: Fractures (Geology), Joints (Geology), *Fracture intersections (Geology).

Careful study of joint patterns by photo-interpretation and supplemental detailed field studies indicates that intersections of joints and foliation plany an important part in the movement of fluids through bedrock. More importantly, for the area under consideration one can demonstrate that any model based on the concept of a closed system will give an erroneous impression of movement of fluids through bedrock. This is an essential consideration in areas of thin cover and complicated structures. Seismic surveys proved useful in making broad distinctions in types of glacial cover as well as in more common use for determining thicknesses of surface and subsurface layers. The detection of shatter zones by this method is less certain but should be considered as a valid preliminary to more direct methods of exploration such as drilling.

2G. Water in Soils

INFILTRATION OF WATER INTO NONUNIFORM SOIL,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
Herman Bouwer.
ASCE Proc, J Irrig and Drainage Div, Vol 95, No IR4, Pap 6937, p 451-462, Dec 1969. 12 p, 5 fig, 2 tab, 11 ref, append.

Descriptors: *Infiltration, *Soil water movement, *Irrigation, *Water spreading, Percolation, Runoff, Wetting, Hydraulic conductivity, Mathematical studies, Mathematical models.
Identifiers: Nonuniform soils.

A simplified procedure for calculating infiltration into soil of nonuniform water content or hydraulic conductivity, or both, is presented. The procedure is based on the Green and Ampt model of piston flow. Input data consist of the difference in water content before and after wetting, the hydraulic conductivity after wetting, and the water entry value of the soil. Techniques for measuring these parameters in the field are briefly described. The procedure is applied to calculate infiltration-time relationships for flood irrigation of a coarse-textured and a fine-textured soil, and to evaluate the effect of nonuniform inundation time on irrigation efficiency. The results show that the usual recommendation of allowing an inundation-time difference of not more than 25% of the time required for the desired amount of water to infiltrate into soil can give irrigation efficiencies of 90% or more. Thus, larger differences in inundation time can be allowed in practice, particularly if the hydraulic conductivity of the soil decreases with depth.

ANALYSIS OF INFLITRATION INTO DRAINING POROUS MEDIA,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
Frank D. Whisler, and Keith K. Watson.
ASCE Proc, J Irrig and Drainage Div Vol 95, No IR4, Pap 6946, p 481-491, Dec 1969. 11 p, 13 fig, 10 ref, append.

Descriptors: *Infiltration, *Drainage, *Groundwater movement, *Soil water movement, Flooding, Irrigation, Water spreading, Numerical analysis, Saturated flow, Filtration, Hysteresis, Wetting, Drying, Recharge, Sands, Mathematical studies.
Identifiers: Wetting fronts.

Numerical analysis was applied to the inundation of a draining sand column. A method was proposed whereby hysteresis could be considered. For Botany sand, after periods of short drainage between inundations, infiltration is rapid. For longer periods of drainage the ensuing infiltration is slower, but the water moves through the media with a much steeper front. The effects of hysteresis are dynamic, depending upon the stage of drainage and the relationship used. Using a strictly wetting curve gives a better prediction than a strictly draining curve. (Knapp-USGS)

THE EFFECT OF GYPSUM ON THE WATER STORAGE IN A SANDY LOAM SOIL UNDER AN IRRIGATED PERENNIAL PASTURE,
Commonwealth Scientific and Industrial Research Organization, Riverina (Australia). Riverina Lab.
B. J. Bridge, and C. R. Kleinig.
International Congress of Soil Science, 9th, Adelaide, Australia, Transactions, Vol 1, p 313-323, 1968. 3 tab, 3 fig, 14 ref.

Descriptors: *Gypsum, *Soil moisture, *Irrigation efficiency, *Soil chemical properties, *Hydraulic conductivity, Soil-water-plant relationships, Semiarid climates, Soil physical properties, Clays, Clovers, Productivity, Calcium, Sodium, Magnesium, White clover, On-site investigations, Electrical conductance, Pastures, Cation exchange.
Identifiers: *Australia.

This paper describes an experiment in New South Wales, Australia, to study the effect of gypsum on a red brown soil with 34% clay content in the B horizon and low hydraulic conductivity. A split plot design was used with three replications with treatments of three irrigation frequencies. Gypsum was applied at the rate of 10 metric tons/ha. White clover was grown and harvested as a measure of productivity. Gypsum had no effect on bulk density but it significantly increased soil moisture storage at all levels of irrigation. Hydraulic conductivity of the subsoil was increased, as was exchangeable calcium, while sodium and magnesium were decreased. There was also a significantly increased production of white clover accompanying these soil changes. Average growth rate increased from 18.0 to 43.4 Kg D.M./ha/day. The gypsum produced an increased efficiency in the use of applied irrigation water. (Crouse-Arizona)

FACTORS DETERMINING THE HYDRAULIC CONDUCTIVITY OF RED MEDITERRANEAN SOILS AND DERIVED TYPES,
Water Planning for Israel Ltd., Tel-Aviv.
J. E. Berend, and S. Kary.
International Congress of Soil Science, 9th, Adelaide, Australia, Transactions, Vol 1, p 273-282, 1968. 2 tab, 1 fig, 9 ref.

Descriptors: *Hydraulic conductivity, *Sands, *Soil formation, *Water spreading, *Soil structure, Lime, Water table, Recharge, Carbonates, Anaerobic conditions, Citrus fruits, Clays, Soil physical properties, Reclamation, Soil profiles, Pervious soils, Dunes, Aeolian soils, Irrigated land, Agriculture, Arable land, Semiarid climates, Soil types, Leaching, Soil analysis, Percolating water.
Identifiers: *Israel.

This article reports a study of hydraulic characteristics of soils on Israel's northern coastal plain. Although annual rainfall is 450-500 mm, the evaporative potential is approximately 1.1 meter per year. This evaporation and the fact that soils have developed on sand dunes result in soil characteristics and problems similar to those of some semiarid or even arid lands. Silt and clay fractions are mainly aeolian in origin, with a wide range of textural variation. Coarse and medium textured soils are considered excellent for irrigated agriculture including citrus orchards. Aims of the study were to locate pervious soils suitable for water spreading and impervious soils suitable for water storage sites; to determine the hydraulic conductivity profile down to the water table, since impervious layers in the subsoil could interfere with the vertical movement of water; and to predict future changes resulting from various uses. Two main soil types found were: 'Hamra', with excellent physical and chemical properties for agriculture and 'Nazaz', with very high clay accumulation in the B horizon, causing low conductivity and even anaerobic conditions. A relatively high bivalent cation content resulted in good structure and maintained the hydraulic conductivity. It was concluded that good management of water spreading should replenish the carbonate content and avoid accelerated illuviation. Liming would be essential to reclaiming the pseudogley type such as the Nazzaz soil. (Crouse-Arizona)

SOIL FORMATION AND SALT MIGRATION IN THE MURGAB RIVER DELTA,
Akademiya Nauk SSSR, Moscow. Pochvennyi Institut.
N. G. Minashina.
International Congress of Soil Science, 9th, Adelaide, Australia, Transactions, Vol 1, p 425-435, 1968. 2 tab, 5 ref.

Descriptors: *Salinity, *Deserts, *Irrigated land, *Soil formation, *Land reclamation, Cultivated lands, Desert plants, Saline water, Irrigation canals, Clay minerals, Sands, Saline soils, Deltas, Soil chemical properties, Groundwater movement, Drying, Irrigation effects.
Identifiers: *USSR, *Kara-Kum Desert, *Murgab River Delta, Oasis.

The Murgab River forms a dry delta in the southeastern Kara-Kum Desert. The alluvium there dates from the middle Quaternary. During the process of drying out of the ancient delta, the soil changed from hydromorphic to a desert phase. While drying the soils became degraded and easily wind-blown. Silt and clay particles were blown away, and sand accumulated. Remaining clay particles helped bind the sand, stabilize the surface and permit establishment of desert vegetation. Under irrigation an oasis soil is formed, depending upon the time span of irrigation, which returns the hydromorphic phase to the soils. In some areas irrigation has been practiced for thousands of years and oasis soils have attained a depth of 3 to 4 m. The old areas plus newer lands have been brought under cultivation with irrigation from the Kara-Kum canal. The source of water, hence the main source of salt, is the Murgab. Part of the soluble salts flow out with groundwater to surrounding desert lands. The salts accumulate in soils, depressions and groundwater of these surrounding regions. The upper 10 to 13 m of soil and groundwater strata were found to be an area of active salt migration. Thus, storage of salts must be carefully considered before reclamation is undertaken of any additional land around the Murgab Oasis. (Crouse-Arizona)

DEVELOPMENT OF A MATHEMATICAL MODEL FOR THE SIMULATION OF FLATLAND WATERSHED HYDRAULICS,
Iowa State Water Resources Research Inst., Ames.
Darrell W. Deboer, and Howard P. Johnson.
Doctoral Thesis, Available from the Clearinghouse as PB-188 793, $3.00 in paper copy, $0.65 in microfiche. Completion Report, Iowa State Water Resources Research Institute, Nov 1, 1969. 255 p, 17 tab, 66 fig, 105 ref, 13 append. OWRR Project A-024-IA

Descriptors: *Mathematical model, Watershed hydraulics, Drainage, Iowa, *Subsurface drainage, *Drainage effects, *Simulation, Hydrologic model, Drainage systems.
Identifiers: *Artificial drainage.

Many acres of midwestern agricultural lands have artificial drainage. The primary reason for artificial drainage is to accelerate the removal of excess water from the soil surface (surface drainage) and the crop root zone (subsurface drainage). The hydraulics and hydrology of excess water removal from agricultural lands by artificial means is not well understood. The primary objective was to develop and test a mathematical watershed model which could reflect the effect of artificial drainage and hydrologic parameter variations on watershed hydrographs. A hydrologic mathematical watershed model was developed for the most recently glaciated region of Iowa. The region is characterized by a flat topography, numerous shallow depressional areas commonly called 'potholes', and surface and subsurface drainage systems. The research effort was based on a previously developed hydraulic mathematical watershed model which simulated the movement of excess water from the depressional areas to the watershed outlet. The hydraulic model used excess water as input to simulate watershed hydrographs. The developed hydrologic model uses precipitation as input and simulates the hydrologic watershed processes of infiltration, surface runoff to depressional areas, soil moisture profile storage, evapotranspiration and percolation of water to the water table. The model simulates the hydrology of a watershed from precipitation input to a watershed outflow hydrograph on an individual storm basis. The model was used to simulate five individual hydrologic events for the 24 square mile East Fork Hardin Creek Watershed, Green County, Iowa. The model simulated hydrographs corresponded in shape with field measured outflow hydrographs. The peak discharge deviation between simulated and actual hydrographs varied from -8 to 29 percent with an 8 percent mean deviation.

SOIL AND WATER MANAGEMENT FOR SALINITY CONTROL,
New Mexico State Univ., University Park.
Harold E. Dregne, and Peter J. Wierenga.
Project Completion Report, Aug 31, 1969. 3 p. OWRR Project C-1361.

Descriptors: *Salts, *Saline soils, *Water quality, Lysimeters, Leaching, Soil-water movement, Hydraulic conductivity.
Identifiers: *Salinity sensors.

Lysimeters five feet high and 2.5 feet in diameter have been instrumented with tensiometers, suction cups, salinity sensors and thermocouples, with provision for automatic data recording. A constant suction was maintained at the bottom of the lysimeters. Upon irrigation of the columns drainage rates remained at a high level for several days. Average drainage rates were 0.74 mm/day, 0.26 mm/day and 0.12 mm/day, respectively, at 25, 50 and 75 after irrigation with no evaporation from the soil surface. Since the salt concentration of the drainage water was relatively high, this indicates that appreciable salt is moved down the soil profile under unsaturated soil water conditions.

GROUND WATER SEEPAGE PATTERNS TO WELLS FOR UNCONFINED FLOW,
Iowa State Univ, Ames. Dept. of Agronomy.
Don Kirkham.
Available from the Clearinghouse as PB-188 910, $3.00 in paper copy, $0.65 in microfiche. Iowa State Water Resources Research Institute, Completion Report, Dec 1969. 9 p, 1 tab, 3 fig. OWRR Project B-002-IA.

Descriptors: *Dupuit-Forchheimer theory, *Flow nets, *Theoretical analysis, Groundwater, Free surfaces, Seepage, Wells, Piezometry, Computer programs.

Dupuit-Forchheimer theory for free surfaces of semi-confined flow has been theoretically investigated as to why the theory fails to predict free surfaces near an outflow sink. It is shown that the theory does indeed give correct free surfaces if the flow medium is of infinite conductivity in the vertical seepage direction as compared with the horizontal. The theory gives non-orthogonal flow nets and examples have been worked out. In another aspect of the research, analytical theory has been developed and digitally computerized to give the free surface for dam seepage; the theory can be modified for well seepage. The present analytical theory needs further development.

2H. Lakes

DENSITY STRATIFIED LAKES IN NORTHERN ELLESMERE ISLAND,
Defence Research Establishment Ottawa, Ontario; and Smithsonian Institution, Washington, D.C. Radiation Biology Lab.
G. Hattersley-Smith, J. E. Keys, H. Serson, and James E. Mielke.
Nature, Vol 225, No 5227, p 55-56, Jan 3, 1970. 2 p, 2 fig, 1 tab, 9 ref.

Descriptors: *Lakes, *Arctic, *Cold regions, *Density stratification, Salinity, Mixing, Diffusion, Sea water.
Identifiers: *Ellesmere Island, Canada.

Lake Tuborg, northern Ellesmere Island (lat 80 deg 50 minN, long 79 deg W) was found to have density stratification. Other lakes in the area show the same phenomenon. All the lakes were formed by isolation of arms of fjords by glacial advances or relative sea-level changes. The lakes are nearly fresh in the upper 5-10 m, and below this depth salinity increases to the bottom. The saline water is probably trapped old sea water. Inflowing fresh water has replaced surface sea water. The stratification is highly stable and is controlled almost entirely by salinity, with temperature playing only a minor part. (Knapp-USGS)
W70-02446

SOME EXPERIENCE IN THE STUDY OF THE DYNAMICS OF A BENTHONIC WATER LAYER IN THE NEAR-SHORE ZONE OF RESERVOIRS (RUSSIAN),
V. G. Bybka.
In: Vodnye Resursy i Vodnoe Khozaystvo Sibiri (Water Resources and Water Economy of Siberia), Akad Nauk SSSR, Sibirskoye Otdelenie, Geogr Obshchestvo, Novosibirsk, USSR, p 95-101, 1968. 7 p, 2 fig, 5 ref.

Descriptors: *Reservoirs, *Hydrodynamics, *Water levels, *Shores, *Zoning, Turbulence, Topography, Slope stability, Waves (water), Streamflow, Water pressure, Sedimentation, Erosion.
Identifiers: *USSR, Shore-zone reservoir dynamics.

The dynamics of benthonic water layers was investigated on the basis of laboratory and experimental data recorded at the Novosibirsk water reservoir. The distribution and variations in the near-bottom pressures and the transfer of water and sediment load in the near-bottom layers are intimately associated with the degree of deformation of surface waves and with the shore relief. The positive pressures are characterized by their absolute values and the negative pressures are characterized by their considerable duration lengths. The erosion and transfer of material in an erosion zone is due to the presence of a wave whose duration activity is comparable with that of an inverse flow. (Gabriel-USGS)

THE IMPORTANCE OF PROTOZOA IN CONTROLLING THE ABUNDANCE OF PLANKTONIC ALGAE IN LAKES,
Freshwater Biological Association, Ambleside (England).
Hilda M. Canter, and J. W. G. Lund.
Proceedings of the Linnean Society of London, Vol 179, No 2, p 203-219, June 1968. 4 fig, 2 tab, 4 plates, 24 ref, appendix.

Descriptors: *Protozoa, *Lakes, *Grazing, *Herbivores, *Algae, *Chlorophyta, Food chains, Food webs, Parasitism, Ecology, Aquatic productivity, Plankton, Life cycles, Productivity, Phytoplankton.
Identifiers: *Algal control, English Lake District, Esthwaite Water, Lake Windermere, Blelham Tarn, Eudorina elegans, Dictyosphaerim pulchellum, Coenococcus planctonicus, Gemellicystis imperfecta, Paulschulzia tenera, Paulschulzia pseudovolvox, Sphaerocystis schroeteri, Pseudosphaerocystis lacustris, Pseudosphaerocystis neglecta, Pseudosphaerocystis lundii, Synura, Pseudospora, Heliozoa.

Protozoa are described of the genus Pseudospora, which feed on and destroy the colonial flagellate algae, Eudorina elegans and Synura sp, and the colonial green mucillage-embedded algae, Dictyosphacrium pulchellum, Coenococcus planctonicus (Eutetramorus lundii), Gemellicystis imperfecta (Pseudosphaerocystis lacustris, P neglecta, P lundii), Paulschulzia tenera (P pseudovolvox), and Sphaerocystis schroeteri (sensu lato). These grazing herbivores, and others known from previous studies, may be important ecological agents in relationships between primary and secondary production. In waters of the English Lake District, the planktonic mucillage-embedded green algae populations were, for the first time, shown to be decimated in short periods following the appearance of a few of the appropriate protozoans within their colonies. As algal numbers decreased, the percentage of algal colonies containing protozoa increased. Infestations occurred primarily during spring and summer when colonial green algae were most common. Results of experiments with laboratory cultures suggested a high degree of specificity of Pseudospora sp for host algae despite close morphological relationships among the algae. The protozoa were described in some detail as to life cycle: free swimming, feeding amoeboid, and encysted stages; and as to peculiarities in method of attack on algae. (Gerhold-Wisconsin)

Minute rod-shaped organisms, occasionally present in almost pure stands, colored green a shallow freshwater lake in Scotland. Authors studied its morphology, temporal abundance, and spatial distribution, and measured gross photosynthetic production to determine whether it is a bacterium or cyanophyte (blue-green alga). It was culture studied with light microscopy (transmitted light or phase contrast illumination) and with electron microscopy. Microanatomy showed conclusively that it is a cyanophyte of bacterial proportions, with cylindrical bundles of microtubules at end of each cell, a feature apparently previously unrecorded in cyanophytes. It is apparently an undescribed species of the genus Synechococcus. The phytoplankton standing crop was estimated regularly; gross photosynthetic production measured fortnightly. Present in small amounts throughout winter, numbers of Synechococcus gradually rise beginning in late April, and in June and July, account for over 90% of the estimated total live crop volume. Evidence suggests that, with increasing eutrophication of the loch, blooms have become more common and persistent, those composed of cyanophytes being associated with poor fishing. Whether this species forms part of those blooms is unknown, since untrained observers might easily have mistaken it for a bacterium. (Jones-Wisconsin)

MODERN HYDROCARBONS IN TWO WISCONSIN LAKES,
Princeton Univ., N.J. Dept. of Geology; and Shell Oil Co., Houston, Tex. Technical Services Div.
Sheldon Judson, and Raymond C. Murray
Bulletin of the American Association of Petroleum Geologists, Vol 40, No 4, p 747-750, Apr 1956. 1 fig, 5 ref.

Descriptors: *Lakes, *Wisconsin, Carbon radioisotopes, Sediments, Diagenesis, Organic matter, Chemical analysis, Oxygenation, Oxidation, Eutrophication, Oligotrophy.
Identifiers: *Hydrocarbons, Lake Mendota (Wis), Trout Lake (Wis), Carbon-14, Chemical processes, Sludge-marl sediments, Gyttja, Hydrocarbons (Dead), Hydrocarbons (Modern).

The content of radiocarbon (carbon-14) was determined in bottom sediments of two large Wisconsin lakes: eutrophic Lake Mendota, located in the southern part of the state, and oligotrophic Trout Lake, located near the Michigan boundary. The black sludge-buff marl sediment of Lake Mendota averaged 11% of organic matter and 232 ppm (parts per million) of hydrocarbon; the olive green gyttja of Trout Lake contains about 45% of organic matter and only 277 ppm of hydrocarbon. This discrepancy is attributed to the difference in the nature of organic matter and the level of oxygenation. In contrast with highly oxidizing conditions of Trout Lake, the deficiency of oxygen in Lake Mendota precludes the destruction of hydrocarbons. The radiocarbon activity, detected in sediments of both lakes, indicated that these compounds are of recent origin and not 'dead' constituents of contamination. (Wilde-Wisconsin)

Identifiers: *Saskatchewan (Canada), Canada, Morphometric data, Mineral content, Mesotrophy, Chironomids, Sphaeriids, Mysis, Pontoporeia, Pickerel, Bubot, Edaphic factors.

Biomasses in 12 large lakes of northern Saskatchewan vary greatly. Five eutrophic lakes on glacial drift have standing plankton crops, bottom organisms, and fish, several times greater than five oligotrophic lakes on Precambrian Shield. Lakes straddling the margin of the Shield are mesotrophic. Underlying reasons for oligotrophy in Shield lakes and increasing eutrophy in more southerly lakes may be edaphic. Since most northern lakes are deep, and most south of the Shield are shallow, this morphometric difference accentuates edaphic influences. Climate also may contribute to differences in biological production. Comparisons between individual lakes of the Precambrian group suggest that morphometric conditions in this group are perhaps less effective than edaphic, particularly in unique Frobisher Lake. Comparisons of five lakes on the glacial drift suggest that continuous mixing of eutrophic Big Peter Pond increases productivity, while rapid flushing of Ile a la Crosse results in markedly decreased production. Eight characteristics--three biological and five physical--appear useful in classifying these lakes. Ranking each lake with respect to these quantified characteristics and comparing summed values may be useful, especially in connection with fish management. (Jones-Wisconsin)

MOUNTAIN AND DESERT LAKES IN SOUTHERN KAZAKHSTAN, THEIR RESOURCES AND METHODS OF ECONOMIC DEVELOPMENT,
G. G. Muravlev.
Translated from Akademiia Nauk Kazakhskoi SSR, Vestnik, p 38-45, Oct 1967. JPRS Translation 45063, April 1968. 12 p.

Descriptors: *Lakes, *Arid lands, *Multiple purpose, *Natural resources, *Resource development, Geologic formations, Geology, Phreatophytes, Surface waters, Groundwater, Mineral water, Fresh water, Fish management, Economics, Mountains, Structural geology.
Identifiers: *USSR, *Kazakhstan.

The author presents a broad coverage of literature on geologic history and structure and on resources of numerous lakes of Southern Kazakhstan, USSR, together with a discussion of implications regarding resources and their economic development. He divides them broadly into mountain fresh water lakes and desert lakes of a generally shallow nature, with either fresh or mineralized water. The mountain lakes are supplied by surface waters of brooks and rivers and groundwaters of local origin. Glacial melt becomes important at higher elevations. The desert lakes have the same basic sources but from mountains rather than local runoff, which is negligible. Resources of these high quality, freshwater mountain lakes are limited to few fish and recreation potential as yet unrealized because of inadequate roads. The desert lakes are relatively rich in resources: abundant fish and crustaceans, moisture-loving plants, many shore animals such as muskrats, fresh or mineralized water, mineral bottoms, coastal deposits, recreation potential and a potential for growing valuable water plants such as rice. However, the resources may be unstable owing to climatic and water fluctuations. The author proposes that potential economic value of these lakes can only be realized in full through planned long term management: procedures such as structures to stabilize the water level and replacing 'trash' fish with valuable commercial species. LAKE TYPES AND LAKE SEDIMENTS,
Copenhagen Univ. (Denmark). Geographical Lab.
Kaj Hansen.
Verh Internat Verein Limnol, Vol 14, p 285-290, July 1961. 2 fig, 2 tab, 6 ref.

Descriptors: *Lakes, *Lake soils, Eutrophication, Oligotrophy, Dystrophy, Diatoms, Sediments, Calcium carbonate, Peat, Diagenesis.
Identifiers: *Lake typology, Rations (Carbon/Nitrogen), Polyhumous sediments, Silicon dioxide, Tyrfopel, Dy, Gyttja, Oligohumous sediments, Denmark, Sweden, Ortho-eutrophic lakes, Para-eutrophic lakes, Ortho-oligotrophic lakes, Para-oligotrophic lakes.

Lake sediments with C/N (carbon-to-nitrogen) ratio of 10 or less should be classified as gyttja, whereas those of higher ratio as dy. With an increase in the content of acid humus and C/N ratio, the dy changes to tyrfopel, as the initial phase of peat formation. The suggested classification of lake sediments is based on two ordinates. The Y axis of C/N ratios from 0 to 20 delineates the oligohumous or gyttja sediments from the polyhumous sediments of dy and tyrofopel types. The X axis expresses 0 to 100% contents of calcium carbonate plus alkali soluble silicon dioxide of diatom frustules. The gyttja of oligohumous oligotrophic lakes originates chiefly from the benthos vegetation and consists in a large part of mineral matter; the gyttja of eutrophic lakes is predominantly of planktonic nature. The paper stresses shortcomings of previous classifications by Thienemann (Die Binnengewasser Mitteleuropas. Binnengewasser I, Stuttgart, 1925), Naumann (Grundzuge der regionalen Limnologie, Binnengewasser II, Stuttgart 1932) and Berg (Berg K. and Petersen, I. C. Studies on the Humic Acid, Lake Gribso. Folia Limnol. Scand. No. 8, 1956). (Wilde-Wisconsin)

THE SUCCESSION OF 'BLOOM' SPECIES OF BLUE-GREEN ALGAE AND SOME CAUSAL FACTORS,
Saskatchewan Univ., Saskatoon.
U. T. Hammer.
Verh Internat Verein-Limnol, Vol 15, p 829-836, Feb 1964. 3 fig, 1 tab, 5 ref.

Descriptors: *Cyanophyta, *Environmental effects, *Succession, Ecology, Lakes, Distribution, Temperature, Salinity, Phosphates, Sampling, Semiarid climates, Precipitation (Atmospheric), Ice, Chemical analysis, Scum, Seasonal, Physiological ecology, Water pollution effects, Eutrophication, Cycling nutrients, Nutrient requirements, Calcium, Magnesium, Sodium, Carbonates, Sulfates.
Identifiers: *Bloom species, Saskatchewan (Canada), Hudson Bay (Canada), Orthophosphates, Physical analysis, Species interactions, Anabaena flos-aquae, Aphanizomenon flos-aquae, Lyngbya birgei, Microcystis aeruginosa, Oscillatoria prolifica, Oscillatoria rubescens.

Results are reported of investigations of ecological relationships of planktonic cyanophytes (blue-green algae), primarily those species which formed water blooms. Twenty-three lakes in southern Saskatchewan, Canada, were periodically examined during periods of 1-3 years. Distribution and bloom production of some of these species with respect to water salinity and temperature, orthophosphate concentration, and species interaction are discussed. Lake waters sampled varied from fresh water to extremely saline. Five freshwater lakes are of the carbonate type, while the others are sulphate lakes; none can be classified as chloride types. The bloom-producing species found were Anabaena flos-aquae, Aphanizomenon flos-aquae, Lyngbya birgei, Microcystis aeruginosa, Oscillatoria prolifica, and Oscillatoria rubescens. Temporally, blooms appeared in the following order: Anabaena, Microcystis, and Aphanizomenon. Numbers of Anabaena usually declined with or before onset of other blooms. Water temperature influenced the time of appearance and sequence of bloom formation. Optimum orthophosphate concentrations varied for different species. Accumulation and storage of orthophosphate by algae, its subsequent use in bloom production, and its liberation into the water upon bloom decomposition was evident. Species interaction apparently played a role in bloom persistence and periodicity. (Jones-Wisconsin)

DENSITY FLOW REGIME OF ROOSEVELT LAKE,
Battelle Memorial Inst., Richland, Wash. Dept. of Environmental Health and Engineering; and Bureau of Commercial Fisheries, Seattle, Wash. Fish Passage Research Program.
Robert T. Jaske, and George R. Snyder.
Journal of the Sanitary Engineering Division, Proceed of ASCE, Vol 93, No SA3, p 15-28, June 1967. 11 fig, 9 ref.

Descriptors: *Density currents, *Thermal stratification, *Reservoirs, Flow, Temperature, Columbia river.
Identifiers: Canadian Treaty, Flow regime, Lake Roosevelt, Interfacial layers.

The thermal regime of Lake Roosevelt for the summers of 1964 and 1965, when compared with Yih and the Laboratory studies of Debler, shows good agreement regarding the position of the interfacial layer between the upper, relatively stagnant zone and the region of primary flow transport. Further study of the temperature data and confirmation by a limited amount of current measurement shows the location of a second, lower interface roughly conforming to the upper boundary. During the season when stratification occurs, the resulting jet flow travels in a flat, undulating fashion, at times rising above the level of the discharge. Existing theory appears inadequate to fully predict this behavior, although an empirical relationship can be derived to perform engineering analysis. The study confirms the necessity to consider density currents in the management of special releases and in thermal and chemical material balances. Furthermore, the dynamic conditions within the reservoir distort the resulting flow jets to the extent that cooler masses can be by-passed. Another result is the blocking of the formation of 'normal' current jets, and, as a consequence, Lake Roosevelt fills with cool water by displacement from the north without any significant horizontal redistribution. CLADOCERAN FAUNAS ASSOCIATED WITH AQUATIC MACROPHYTES IN SOME LAKES IN NORTHWESTERN MINNESOTA,
Minnesota Univ., Minneapolis. Limnological Research Center.
Henry W. Quade.
Ecology, Vol 50, No 2, p 170-179, 1969. 8 fig, 1 tab, 19 ref.

Descriptors: *Aquatic animals, *Lakes, *Minnesota, Chara, Littoral, Dynamics, Ecology, Daphnia, Alkalinity, Sulfates, Dissolved solids, Depth.
Identifiers: *Cladoceran, *Macrophytes, Lake Itaska (Minn), Autecology, Squaw Lake (Minn), Long Lake (Minn), Elk Lake (Minn), Lake Morrison (Minn), Lake Mary (Minn), Bad Medicine Lake (Minn), Tulaby Lake (Minn), Chydoridae, Sididae, Bosminidae, Daphnidae, Macrothricidae, Polyphemidae, Ceratophyllum demersum, Naias flexilis, Potamogeton natans, Nuphar variegatum, Community coefficient, Per cent similarity.

Cladoceran faunas associated with twelve species of aquatic macrophytes were studied to determine whether Cladocera showed community preference to specific plants. Almost 3000 specimens belonging to 38 Cladocera species were counted. Forty-two collections were made in seven lakes near Lake Itasca (northwest Minnesota), using SCUBA to select appropriate single-species stands of the twelve plants. Some grouping was evident upon tabulating all collections from each plant specie. The cladoceran communities resulted in a breakdown of plants into five groups: broad-leaved submersed, fine-leaved submersed, floating-leaved, Chara, and others. Water depth and sediment type did not seem to limit distribution of those plant groups that showed specific cladoceran associations. Upon grouping all cladoceran collections from a single lake, two limnologically similar lakes showed distinct cladoceran faunas. Two measurements of community type, namely coefficient of community and per cent similarity, were calculated, the latter giving better results. These measurements supported the hypothesis that aquatic macrophytes control the distribution of the littoral Cladocera. The hypothesis could be further evolved by testing one plant species in many lakes or many plant species in one lake. (Jones-Wisconsin)

SOME PHYSICAL AND CHEMICAL FACTORS IN THE METABOLISM OF LAKES,
Saskatchewan Univ., Saskatoon.
D. S. Rawson.
American Association for Advancement of Science Bulletin, Vol 10, p 9-26, 1939. 6 fig, 81 ref.

Descriptors: *Lakes, *Metabolism, Eutrophication, Manganese, Oligotrophy, Oxidation-reduction potential, Dystrophy, Silica, Lake morphometry, Organic matter, Depth, Inhibitors, Epilimnion, Hypolimnion, Benthic fauna, Geology, Temperature, Thermal stratification, Turnovers, Cisco, Trout, Oligochaetes, Oxygen, Thermocline, Methane, Hydrogen sulfide, Hydrogen ion concentration, Calcium, Phosphorus, Nitrogen, Nitrogen compounds, Iron.
Identifiers: *Physical factors, *Chemical factors, Stagnation (Winter), Ooze, Stagnation (Summer), Biological deserts, Trophogenic zones, Oxidation (Bacterial), Transparency, Oxygen excess, Ratio (Oxygen/carbon dioxide), Microcosms, Littoral development, Alkalitrophic lakes, Siderotrophic lakes, Grote's ecological spectrum, Autochthonous sources, Allochthonous sources.

A comprehensive review of physical and chemical factors influencing the composition of lake waters is presented. The essay is of special importance for a novice in eutrophication research and contains a classic figure delineating relationships between geographic locations of lakes and their trophic nature. The paper critically assesses oxygen deficits as a factor in lake metabolism and concludes that this parameter is most valuably considered in terms of rates on a daily basis rather than as standing quantities. Effects of oxygen as a limiting factor are often confounded with those of concentrations of carbon dioxide and hydrogen sulfide, and of low temperatures. This early paper was among the first to indicate the need for research in the dynamic fine structure including rates of utilization and transfer of the cycling nutrients, nitrogen and phosphorus. ON THE RELATION BETWEEN THE OXYGEN DEFICIT AND THE PRODUCTIVITY AND TYPOLOGY OF LAKES,
Yale Univ., New Haven, Conn. Osborn Zoological Lab.
G. Evelyn Hutchinson.
Internationale Revue der gesamten Hydrobiologie u Hydrographie, Vol 36, p 336-355, 1938. 1 fig, 1 tab, 41 ref.

Descriptors: *Oxygen, *Productivity, *Lakes, Hypolimnion, Plankton, Limnology, Methane, Lake Mendota (Wis), Standing crop, Organic matter, Oligotrophy, Areal, Epilimnion, Depth, Volumetric analysis, Productivity, Eutrophication, Dystrophy, Turnovers, Thermal stratification.
Identifiers: *Oxygen deficit, *Lake typology, Iodine, Crater lakes, Green Lake (Wis), Fureso (Denmark), Calorific values, Devil's Lake (Wis), Geneva Lake (Wis), Okauchee Lake (Wis), Elkhart Lake (Wis), Garvin Lake (Wis), Desmids, Pallett Lake (Wis), Morphometric oligotrophy, Eifel (Germany), Germany, Bulgaria, Himalayas, Edaphic oligotrophy, Mysis oculata relicta.

In lakes where hypolimnetic oxygen is exhausted 'real oxygen deficit' is defined as 'apparent oxygen deficit', directly determined, plus the oxygen equivalent of methane, iodine reducing compounds, and other compounds not found in presence of abundant oxygen. Real oxygen deficit may be calculated on actual or absolute basis. In Wisconsin lakes (Green, Black Oak, and Mendota) and the Danish Fureso, rates of development of the absolute hypolimnetic oxygen deficit per square centimeter of hypolimnetic surface, is proportional to mean standing crop of plankton per unit area of lake surface. Strom's method of using hypolimnetic deficit, referred to unit area, as measure of productivity, is justified for harmonic temperate lakes. In Mendota and Fureso, deficit developed in one month, when compared to planktonic organic matter on an energetic basis, approximately represents mean standing crop. Areal deficit in some lakes in different districts is considered. In lakes with maximum depths of 50-75 meters, a complete range from unproductive to productive is found. Mean areal deficit of several lakes in a single district gives useful characterization of its regional limnology. Lundbeck's distinction between primary (edaphic) and secondary (morphometric) oligotrophy is fundamentally important in lake typology. (Jones-Wisconsin)

SEDIMENTARY PHOSPHORUS IN LAKE CORES--OBSERVATIONS ON DEPOSITIONAL PATTERN IN LAKE MENDOTA,
Wisconsin Univ., Madison. Water Chemistry Lab.
Dennis A. Wentz, and G. Fred Lee.
Environmental Science and Technology, Vol 3, No 8, p 754-759, Aug 1969. 5 fig, 1 tab, 20 ref.

Descriptors: *Lakes, *Phosphorus, *Lake sediments, *Cores, Wisconsin, Sludge, Eutrophication, Nutrients, Cycling nutrients, Sediment-water interfaces, Sewage effluents, Water pollution effects, Carbonates, Soil chemistry, Water chemistry, Water pollution sources, Aquatic productivity, Urbanization, Carbon cycle, Iron, Organic matter, Manganese, Sorption, Diagenesis, Marl.
Identifiers: *Lake Mendota (Wis), Phosphorus (Available), Phosphorus (Total), Cultural eutrophication, Autochthonous materials, Freundlich equation, Ratio analysis, Clastic materials, Apatite.

Available P (phosphorus) is an operationally defined fraction of lake sediments available for plant growth. A core, from the deepest part of eutrophic Lake Mendota, Wisconsin, has been analyzed for available P by a method previously described. Ratio, available P/total P, generally ranges between 0.4 and 0.7 in lake sediments. The ratios in the core are examined and conslusions are made regarding deposition of available P in the lake: clastic materials/carbonate carbon, organic carbon/carbonate carbon, available P/carbonate carbon, available P/clastic materials, available P/iron, and iron/carbonate carbon. Deposition rate of available P was constant in marl layer, increased concomitantly with a change from marl to sludge, was maximal about 30 centimeters below sediment-water interface, and decreased gradually from that stratum to surface. Initial increases may correspond with man's appearance in the watershed. Decrease may correspond with cessation of input of city of Madison's sewage effluents in 1899. Evidence derived from this study suggests that available P is probably associated with carbonate portion of the sediments, and that changes in its deposition correlate with events influencing the eutrophication of the lake. 2I. Water in Plants

ALFALFA WATER TABLE INVESTIGATIONS,
Agricultural Research Service, Reno, Nev. Soil and Water Conservation Research Div.
Rhys Tovey.
ASCE Proc, J Irrig and Drainage Div, Vol 95, No IR4, Pap 6974, p 525-535, Dec 1969. 11 p, 7 fig, 1 tab, 7 ref.

Descriptors: *Evapotranspiration, *Consumptive use, *Alfalfa, *Groundwater movement, *Water level fluctuations, Water table, Irrigation, Irrigation water, Irrigation efficiency, Water demand, Water utilization, Lysimeters, Soil moisture.

Identifiers: Water use (Alfalfa).

Use of water by alfalfa growing under high water table conditions was studied to determine the irrigation requirement. A three-season average of consumptive use and yield of alfalfa, disregarding soil textures, showed an almost straight-line relationship with water table depth for the nonirrigated treatment. The nonirrigated alfalfa showed the effects of static water table depth on the consumptive use and yield of alfalfa. Peak consumptive use occurred when the alfalfa was at or approaching the one-tenth bloom stage and temperatures were high. Only minor differences in the growth of alfalfa were found for the various static water table, soil, and irrigation treatments. The alfalfa plants in the lysimeters showed good root development, with roots in the saturated zone and enlarged white rootlets extending below the water table level. Pan evaporation, net radiation, and the Olivier method adequately predicted cumulative consumptive use for an 8-ft water table, but were low for 2-ft and 4-ft water table depths. None of the prediction methods reflected peak consumptive use periods for alfalfa grown in the presence of static shallow water tables. (Knapp-USGS)

GERMINATION STUDIES OF PERENNIAL GRASS SEEDS,
Central Arid Zone Research Inst., Jodhpur (India).
L. D. Ahuja, and C. P. Bhimaya.
Annals of Arid Zone, Vol 6, No 2, p 146-152, 1967. 3 tab, 11 ref.

Descriptors: *Arid lands, *Range grasses, *Germination, *Seeds, *Economic efficiency, Range management, Ranges, Seed treatment, Plant physiology, Economics, Research and development, Natural resources, Livestock, Revegetation, Sands, Grasses, Deserts.
Identifiers: *Range rehabilitation, *Perennial grasses, *Rajasthan, India, Reseeding.

The economy of arid Western Rajasthan, India, is closely linked to the livestock industry which must utilize seriously deteriorating ranges. Successful range management will depend upon successful reseeding of appropriate perennial grasses. It is necessary to know germination characteristics and requirements of grasses suited to the area in order to conduct successful and economically efficient range rehabilitation. Germination trials of five species were conducted in petri dishes and in a sand medium. The petri dish trials were found unsuitable. Results of the germination trials in the sand medium are presented in tables. Germination percentages varied significantly between species, with averages ranging from 73.1 to 28.2 percent. Possible physiological reasons for the differences are discussed briefly. (Crouse-Arizona)

PHYTOSOCIOLOGICAL VARIATIONS IN FLORISTIC COMPOSITION OF THE VEGETATION IN THE ARID ZONE: I. MONSOONAL VEGETATION OF THE ALLUVIAL PLAINS,
Central Arid Zone Research Inst., Jodhpur (India).
Y. Satyanarayan, and Y. D. Gaur.
Annals of Arid Zone, Vol 6, No 2, p 178-199, 1967. 6 tab, 3 fig, 28 ref.

Descriptors: *Arid lands, *Ecology, *Vegetation, *Plant populations, *Plant growth, Alluvium, Ranges, Weeds, Plants, Desert plants, Forages, Xerophytes, Germination, Growth stages, Seeds, Hot winds, Moisture availability, Moisture stress, Soil moisture, Monsoons, Wet seasons, Dry seasons, Climatic data, Competition, Vegetation establishment.
Identifiers: *India, *Annual plants, *Perennial plants.

In arid zones one of the most important vegetation forms is the Therophytes. These are annuals which spring up following a rainy period, move swiftly through their life cycle and survive through the dormant season only in seed form. Therophytes usually form some of the most palatable forage and are likely to be grazed off before mature seeds develop if the arid range is overgrazed. This paper reports a study of floristic changes that occur in range lands on the alluvial plains near Jodhpur, India. The climate of the area is characterized by low rainfall, high temperatures, low humidity and desiccating winds. The monsoons occur during the summer and the growing season of about 90 days follows onset of the rains. Only five perennials were found in the long dry period before the monsoons. During monsoons perennials increase in number of colonies but decrease in number of individuals. Forbs increase rapidly in number but perennial weeds are slow to germinate. Desirable ephemerals do not complete successfully with weed species which compete more successfully with perennials. Five species were found that could behave as annuals or as perennials depending upon environmental conditions. (Crouse-Arizona)

EFFECTS OF EXTERNAL SALT CONCENTRATIONS ON WATER RELATIONS IN PLANTS. VI: EFFECTS OF THE EXTERNAL OSMOTIC WATER POTENTIAL ON SOLUTE REQUIREMENT, SALT TRANSPORT KINETICS AND GROWTH RATES OF LEAVES,
California Univ., Riverside. Dept. of Soils and Plant Nutrition.
J. J. Oertli.
Soil Science, Vol 105, No 5, p 302-310, 1968. 12 fig, 9 ref.

Descriptors: *Salts, *Soil-water-plant relationships, *Osmotic pressure, *Plant growth, *Arid lands, Salinity, Plant physiology, Air environment, Soil environment, Environmental effects, Vegetation effects, Leaves, Moisture stress, Turgidity, Solutes, Soil water, Cytological studies, Barley, Kinetics, Xylem, Growth rates, Isotherms.
Identifiers: *Water potential, *Salt transport (Plants).

This is one of a series of reports on effects of salt in soil water on plant-water relations. The experiment measured osmetic potential in the petiole and external solution using a Mechrolab vapor pressure osmometer. Turgor pressure of expanding leaf cells was arbitrarily set at 5 bars. The external solute requirement required to maintain this turgor pressure as water potential varied was measured. The results are presented in graphic form. Different turgor pressures would result in parallel shifts in the curve. Results indicate that solute requirements to maintain turgor pressure in leaves increase in proportion to external water stress. Salt transport through the plant decreases in efficiency with increasing salt accumulations. In elongating cells solute requirements must be met continuously. It follows then that cell expansion and leaf growth should be less at either low or high salt concentrations. The optimum level will be somewhere in the middle. Experimental results with barley seedlings supported this conclusion. It was observed that high atmospheric moisture stress, common in arid lands, decreased growth rates by increasing solute requirements. Growth reduction, even without visible leaf injury caused by salinity, is a result of osmotic relationships. (Crouse-Arizona)

DETERMINATIONS OF LEAF AND FRUIT WATER POTENTIAL WITH A PRESSURE CHAMBER,
Commonwealth Scientific and Industrial Research Organization, Griffith (Australia). Irrigation Research Lab.
Betty Klepper, and R. D. Ceccato.
Horticultural Research, Vol 9, No 1, p 1-7, 1969. 2 plates, 1 fig, 9 ref.

Descriptors: *Plant physiology, *Plant tissues, *Soil-water-plant relationships, *Irrigation efficiency, Horticultural crops, Turgidity, Leaves, Fruit crops, Pressure, Osmotic pressure, Measurement, Instrumentation.
Identifiers: *Water potential, *Pressure chamber, Australia.

The water status of a plant can be measured by its water potential. The water potential of a leaf is the sum of components such as osmotic and matric potential of the cells and pressure potential arising from turgor. All of these affect the chemical potential of leaf water. Research on water status of horticultural plants is particularly important in dry areas since it is valuable in developing guidelines for irrigation practices. The authors report on an experiment conducted in New South Wales, Australia, to test usefulness of a pressure chamber in measuring water potential of both leaves and fruits in horticultural plants. The pressure chamber proved useful and sufficiently accurate for making field measurements of water potential of both leaves and fruit of horticultural crops. The ability to make field measurements of the water status of fruits opens up new possibilities for developing improved irrigation schedules relative to the needs of developing fruit. (Crouse-Arizona)

2J. Erosion and Sedimentation

LINEAR EROSIONAL FURROWS IN SOUTHAMPTON WATER,
Southampton Univ. (England). Dept. of Oceanography.
K. R. Dyer.
Nature, Vol 225, No 5227, p 56-58, Jan 3, 1970. 3 p, 2 fig, 5 ref.

Descriptors: *Erosion, *Esturaries, *Density stratification, *Currents (Water), Streamflow, Tidal effects, Channel morphology, Bed load, Sediment transport, Scour.
Identifiers: *England, Southampton Water.

Linear erosional furrows were found in the bottom of Southampton Water, an estuary on the south coast of England. Transit sonar and echo sounding show the furrows to have a V-shaped cross-section up to 5 m wide and 1 m deep. Individual furrows could be traced for up to 4 km, though bifurcation and interdigitation occurred. They were spaced between 10-25 m apart and each furrow transgressed across the slope into the deeper water towards the mouth of the estuary. The most extensive occurrence of furrows was on the western side of the deep channel. Measurements of current velocity, salinity and temperature at a number of stations at all states of the tide show that Southampton Water is an estuary of moderately stratified type. During the ebb the velocity 1 m from the bottom exceeds 70 cm per sec and the minimum bed shear stress, calculated using the smooth boundary form of the van Karman-Prandtl equation, reaches 6 dynes per sq cm. (Knapp-USGS)
W70-02445

EFFECTS OF UNIT WEIGHT AND SLOPE ON EROSION,
Cornell, Howland, Hayes and Merryfield, Seattle, Wash.; Montana State Univ., Bozeman. Dept. of Civil Engineering; and Montana State Univ., Bozeman. Dept. of Engineering Mechanics.
Richard L. Foster, and Glen L. Martin.
ASCE Proc, J Irrig and Drainage Div, Vol 95, No IR4, Pap 6984, p 551-561, Dec 1969. 11 p, 9 fig, 2 tab, 6 ref, append.

Descriptors: *Erosion, *Soil erosion, *Slopes, *Soil compaction, Drainage, Rainfall, Roads, Rainfall-runoff relationships, Model studies, Laboratory tests, Statistical methods.

Identifiers: Slope-erosion relations.

Laboratory tests were performed on a fine grained soil to determine the effect of unit weight and slope on erosion and runoff. The tests were conducted on slopes of 1:1, 2:1 and 3:1 using unit weights of 80, 85, 90 and 95 lb per cu ft and a simulated rainfall intensity of 6 in. per hr. After collecting the runoff water and solid particles, the weight of solids eroded and the volume of runoff water were determined. The results and analyses of this study indicate that the slope and unit weight have definite effects on the erosion of unprotected slopes. These indications are: (1) On the flattest slope, the specimens compacted to the lowest unit weight experience the highest rate of erosion; (2) on the steepest slope, the specimens compacted to the highest unit weight experience the highest rate of erosion; and (3) for a given unit weight, there is a unique slope from which the maximum amount of erosion will occur. (Knapp-USGS)
W70-02451

FRICTION FACTORS FOR FLOW IN SAND-BED CHANNELS,
Massachusetts Inst. of Tech., Cambridge. Hydrodynamics Lab.; and Iowa Univ., Iowa City. Inst. of Hydraulic Research.
A. M. Z. Alam, and J. F. Kennedy.
ASCE Proc, J Hydraul Div, Vol 95, No HY6, Pap 6900, p 1973-1992, Nov 1969. 20 p, 9 fig, 4 tab, 28 ref, append.

Descriptors: *Fluid friction, *Alluvial channels, *Roughness coefficient, Roughness (Hydraulic), Sands, Open channel flow, Channel morphology, Dimensional analysis, Stage-discharge relations, Sediment transport, Sedimentary structures.
Identifiers: Hydraulic friction factors.

A new predictor is developed for friction factors of flows in sand-bed channels. A dimensional analysis is pursued to obtain the form of the quantities entering the relation between the geometry of the bed features, the flow properties, and the equivalent shear stress due to the form-drag of the ripples, dunes, etc. Theoretical considerations of the bed stability lead to expressions for the length and height of the bed features in terms of the properties of the bed sediment and flow. These are introduced into the expression yielded by the dimensional analysis, and the resulting frictional relation is quantified with field and laboratory data. The graphical relation of Lovera and Kennedy is used to obtain the flat-bed friction factor. The predictor is evaluated using field data not included in preparation of the graphical relation between the bed-form friction factor, Froude number, and relative roughness. The depth-discharge relations predicted are found to be in good agreement with the measured data. (Knapp-USGS)

SCALING PROCEDURES FOR MOBILE BED HYDRAULIC MODELS IN TERMS OF SIMILITUDE THEORY,
University of Strathclyde, Glasgow (Scotland). Dept. of Civil Engineering.
John G. Herbertson.
J Hydraul Res, Vol 7, No 3, p 315-353, 1969. 39 p, 5 fig, 5 tab, 47 ref.

Descriptors: *Sediment transport, *Hydraulic similitude, *Hydraulic models, *Model studies, Sedimentation, Hydraulics, Particle shape, Particle size, Laboratory tests, Statistical methods, Open channel flow.
Identifiers: Hydraulic model scale effects, Mobile-bed hydraulic models.

After a brief discussion of the scope of mobile bed hydraulic models and a literature review, a similarity method (the method of synthesis) is outlined, and is used to critically examine the bases of a typical cross-section of the existing scaling techniques for such models. From this examination, it is concluded that there are two types of procedure: (1) those specifying model bed material of the same density as in the prototype; and (2) those specifying light weight materials. Attention is given to the much neglected depth effect parameter (D/H) in the discussion of these procedures. It is thought that complete similarity of sediment transportation in conventional models is impossible. As a consequence, further experimental work under strictly controlled conditions is required to determine which effects are negligible under given circumstances. A procedure derived from the method of synthesis is suggested. In it, hydraulic and sedimentation time scales need not be different. (Knapp-USGS)

LATERAL MIGRATIONS OF THE ARKANSAS RIVER DURING THE QUATERNARY-FOWLER, COLORADO, TO THE COLORADO-KANSAS STATE LINE,
Geological Survey, Denver, Colo.
Joseph A. Sharps.
Geological Survey Research 1969, Professional Paper 650-C, p C66-C70, 1969. 5 p, 1 fig, 2 ref.

Descriptors: *Geomorphology, *Alluvial channels, *Meanders, *Colorado, Quaternary period, Pleistocene epoch, Sedimentation, Flood plains, Rivers, Sediment load, Channels, Discharge (Water), Stream erosion.
Identifiers: Arkansas River, Lateral channel-migration.

Former positions of the Arkansas River between Fowler, Colo., and the Colorado-Kansas State line at given times during the Quaternary have been determined from the positions of terraces cut at those times. Lateral migration of the river during Quaternary time was probably caused by the introduction of a greater volume of sediment into the channel from one side than from the other. Gravel deposited by the Arkansas River differs from tributary gravel in composition and grain size. (Knapp-USGS)

SUSPENDED SEDIMENTS UNDER TURBULENT CONDITIONS (RUSSIAN),
L. N. Kaskevich.
In: Vodnye Resursy i Vodnoe Khozyaistvo Sibiri (Water Resources and Water Economy of Siberia), Akad Nauk SSSR, Sibirskoye Otdelenie, Geogr Obschestvo, Novosibirsk, USSR, p 24-29, 1968. 6 p, 1 fig, 4 ref.

Descriptors: *Suspended load, *Sediment load, *Rivers, *Reservoirs, *Winds, Mathematical studies, Turbulent flow, Velocity, Turbidity, Weight, Sedimentation rates, Streamflow, Waves (Water).
Identifiers: *USSR, Water wave-suspended load relations.

Sedimentation rates and turbidity of suspended loads were analytically investigated. A differential equation of the vertical distribution of suspended load was derived and solved. The mathematical analysis of suspended load characteristics in turbulent waters was compared with the data observed at the Novosibirsk Water Reservoir. Streamflow surface waves lead to the conditions of suspended load saturation and the orbital velocity developed during the vertical redistribution of sediments leads to an increase in the mixing of suspended loads. HYDROGRAPHIC AND SEDIMENTATION SURVEY OF KAJAKAI RESERVOIR, AFGHANISTAN,
Geological Survey of Afghanistan, Kabul. Water Resources Div.
Don Perkins, and James K. Culbertson.
Geol Surv Open-file Rep, Dec 1968. 87 p, 36 fig, 8 tab.

Descriptors: *Dams, *Hydrograph analysis, *Reservoir silting, *Reservoir storage, Sampling, Particle size, Mapping, Sediment discharge, Sediment control, Altitude, Topography, Sedimentation rates, Inflow, River basins
Identifiers: *Afghanistan, Helmond River, Kajakai Reservoir.

This monograph presents the results of a hydrographic and sedimentation survey of Kajakai Reservoir on the Helmond River, Afghanistan, made during the period September through December 1968 for the purpose of defining the current stage-capacity relation and to determine the rate of sedimentation and the sediment range lines. Samples were obtained of the lake bed and in the river upstream from the reservoir. No sediments coarser than about 0.063 millimeter are present on the lake bed surface. The median diameter of sands being transported into the reservoir ranges from 0.040 to 0.110 millimeter. The average annual sedimentation rate is 7,800 acre-feet. Assuming an average density of 800 kg per cubic meter, the estimated average sediment inflow to the reservoir is about 7,700,000 metric tons per year. The decrease in capacity at spillway elevation for the period of 1953 to 1968 due to sediment deposition was 7.8% or 117,700 acre feet. (Gabriel-USGS)

BEDLOAD FORMULAS,
Pennsylvania State Univ., University Park. Coll. of Engineering.
Sam Shulits, and Ralph D. Hill, Jr.
Report available from US Dept of Agriculture, NE Watershed Research Center, Room 111, Research Bldg A, University Park, Pennsylvania, 16802. Pennsylvania State University Hydraulics Laboratory Bulletin, Dec 1968. 212 p, 23 fig, 8 tab, 85 ref.

Descriptors: *Bed load, *Sediment transport, *Equations, *Reviews, Computer programs, Bibliographies, Digital computers, Sediment discharge, Discharge (Water), Tractive forces, Open channel flow.
Identifiers: *Bed load formulas.

Formulas for computing bed load are reviewed, and FORTRAN program listings are given for digital computer solution of 14 of them. The programs are for the formulas of Schoklitsch, Meyer-Peter, Casey, Haywood, Straub, Waterways Experiment Station, Shields, Kalinske, Meyer-Peter and Muller, Eizerman and Frijlink, Laursen, Rottner, and Einstein. Results of the formulas are compared by calculating and plotting sediment discharge against water discharge for all of them. Each formula is presented in its original form and units, and its use is explained as the originator intended. It is concluded that 3 of the formulas give the best results, with adequate agreement with data. The Schoklitsch (1934) formula is selected as the best relation of bed load to discharge. The Straub and the Meyer-Peter and Muller formulas are selected as the best relations of bed load to tractive force. The 3 formulas are valid for effective particle diameters from 0.3 to 7 mm. The Schoklitsch (1934) formula is proposed as the best of the 3 because of its simple form and because it produces directly a bed load-discharge rating curve. (Knapp-USGS)

2K. Chemical Processes

THE MECHANISM OF PHOTOSYNTHESIS,
Harvard Univ., Cambridge, Mass. Biological Labs.
R. P. Levine.
Scientific American, Vol 221, No 6, p 58-70, Dec 1969. 11 fig, 1 photo.

Descriptors: *Photosynthesis, Chlorophyll, Fluorescence, Energy transfer, Light, Phosphates.
Identifiers: Emerson enhancement effect, Chemical processes, Carotenoids, Phycobilins, Cytochromes, NADP, NADPH, ATP, Photochemistry, Chlorophyll a, Chlorophyll b, Chloroplasts, Phycocyanobilin, Hill-Bendall scheme, Mitochondria, Component Q, Ferredoxin reducing substance, Plastocyanin, DCMU, Electron transport.

In a state-of-knowledge review, author summarizes information gaps and current hypotheses on photosynthesis, and important biochemical knowledge bearing on postulated new compounds mediating electron transport in the following sequence: entrapment of light energy, conversion to chemical energy, electron transport, production of NADPH (reduced nicotinamide adenine dinucleotide disphosphate) and ATP (adenoisine triphosphate), and carbon dioxide fixation. New information suggests that two, rather than one, light systems operate in the photosynthetic process used by algae and higher plants. Described as the Emerson enhancement effect, both systems can be driven by light of wavelengths less than 680 manometers; only one, by longer wavelengths. A different species of chlorophyll a is apparently involved in the reaction center of each system. Fluorescence measurements played a key role in developing the hypotheses. Excitation energy is transferred to chlorophyll a by chlorophyll b, the carotenoids and phycobilins. Chlorophyll a cannot be used for photosynthesis, it alone is dissipated as fluorescence. In the initial light system, which remains the least understood, four electrons and four protons are extracted from water with the evolution of a molecule of oxygen. No references, but key scientists and their schools are identified. (Gerhold-Wisconsin)

EFFECT OF YELLOW ORGANIC ACIDS ON IRON AND OTHER METALS IN WATER,
Minnesota Univ., Minneapolis. Limnological Research Center.
Joseph Shapiro.
Journal American Water Works Association, Vol 56, No 8, p 1062-1082, Aug 1964. 11 fig, 5 tab, 29 ref.

Descriptors: *Organic acids, *Iron, *Metals, *Water chemistry, Color, Water quality, Water pollution effects, Lakes, Ionization, Humus, Bogs, Humic acids, Peat, Hydrogen ion concentration, Copper, Manganese, Cobalt, Chelation, New Jersey, Connecticut, New York, Dystrophy.
Identifiers: *Metallic ions, *Organic acids (Yellow), Sphagnum, Zinc, Carboxylic groups, Zoar Lake (Conn), Bantam Lake (Conn), Schulze Hardy rule, East Twin Lake (Conn), Charlotburg Reservoir (NY), Litchfield (Conn), Lake Hopatcong (NJ), Pinecliff Lake (NJ), Lake Musconetcong (NJ), Quassapaug Lake (Conn), Peptization.

By the use of filtration, freezing, amberlite column, hydrochloric acid, and extraction with n-butanol, a 900-liter sample of colored lake water rendered about 2 grams of ash-free yellow acidic substance. In the author's opinion, this material consists primarily of aliphatic polyhydroxy carboxylic acids enriched in nitrogen to 1.2-1.9%. The study of this 'yellow acid' included determination of its molecular weight, iron-retention capacity, chelation and peptization, influence of electrolytes and pH of the medium, and behavior toward copper, manganese, cobalt, and zinc. The results suggested the ionization hypothesis, according to which the initial precipitation of iron or iron-adsorbed yellow acids is followed by peptization when the pH has been raised sufficiently to ionize most of the carboxyl groups. The large quantities of iron held in apparent solution in colored waters may be in the form of a protected colloid; where the ratio of color to iron is high, a part of importance may be played by chelation. THERMODYNAMIC MIXING PROPERTIES OF NaCl LIQUIDS,
Harvard Univ., Cambridge, Mass. Dept. of Geological Sciences.
D. R. Waldbaum.
Geochimica et Cosmochimica Acta, Vol 33, No 11, p 1415-1427, Nov 1969. 13 p, 4 fig, 4 tab, 46 ref.

Descriptors: *Geochemistry, *Aqueous solutions, *Thermodynamic behavior, *Liquids, *Potassium compounds, Sodium compounds, Entropy, Energy, Water temperature, Crystallization.
Identifiers: *NaCl-KCl liquids thermodynamics.

The excess Gibbs energies and entropies of mixing of NaCl-KCl liquids have been calculated using previously derived mixing parameters of the crystalline solutions and the temperature and composition of the minimum (657 deg C, 48.5 mole percent KCl) in the melting region. Margules parameters of the liquid based on the present formulation differ by 1 KCl at 800 deg C from the values obtained in electrochemical studies. Solidus and liquidus curves calculated from these results are compared with experimental data from 12 previous studies of the melting region. Alkali buffer potentials, in this system, calculated from the mixing properties of the liquid range from -14.6 plus or minus 0.5 kcal at 796 deg C to -5.90 plus or minus 0.05 kcal at the minimum, to+7.6 plus or minus 0.5 kcal at 770 deg C. (Gabriel-USGS)
W70-02627

GEOCHEMISTRY AND ORIGIN OF FORMATION WATERS IN THE WESTERN CANADA SEDIMENTARY BASIN - I. STABLE ISOTOPES OF HYDROGEN AND OXYGEN,
Research Council of Alberta, Edmonton; and Geological Survey, Denver, Colo.
Brian Hitchon, and Irving Friedman.
Geochimica et Cosmochimica Acta, Vol 33, No 11, p 1321-1349, Nov 1969. 29 p, 8 fig, 7 tab, 45 ref.

Descriptors: *Geochemistry, *Water sources, *Aquifers, *Groundwater, *Sedimentary basins (Geological), Stable isotopes, Hydrogen, Oxygen, Oil fields, Surface waters, Sea water, Deuterium, Statistical methods, Sulfides, Carbonates, Porosity, Shales.
Identifiers: Western Canada basin geochemistry.

Stable isotopes of hydrogen and oxygen, together with chemical analyses, were determined for surface (20 samples), shallow potable formations (8), and oil and gas field waters (79 samples). The observed isotope ratios can be explained by mixing of surface waters and diagenetically modified sea water. Mass balances for deuterium and total dissolved solids in the western Canada sedimentary basin demonstrate that the present distribution of deuterium in the formation waters of the basin can be derived through mixing of the diagenetically modified sea water with fresh water and their subsequent movement through the basin. Statistical analyses of the isotope data indicate an insignificant rate of deuterium exchange between water and hydrogen sulfide and considerable exchange of oxygen isotopes between water and carbonate minerals. (Gabriel-USGS)

PARTICULATE ALUMINUM AND IRON IN SEA WATER OFF THE SOUTHEASTERN COAST OF THE UNITED STATES,
Duke Univ., Beaufort, N.C. Marine Lab.
Larry P. Atkinson, and Unnsteinn Stefansson.
Geochimica et Cosmochimica Acta, Vol 33, No 11, p 1449-1453, Nov 1969. 5 p, 2 fig, 2 tab, 6 ref.

Descriptors: *Geochemistry, *Iron, *Sea water, *Coasts, *United States, Estuaries, Rivers, Salinity, Water chemistry, Continental shelf, Continental slope, Analytical techniques, Mapping, Sampling, Runoff, Seasonal, Chlorides, Clays.
Identifiers: Southeastern coast, Chesapeake Bay, Cape Kennedy.

Sea water samples (39) collected during three cruises of the R/V Eastward in the shelf waters between Chesapeake Bay and Cape Kennedy were analyzed to determine their Al and Fe content. The study indicates that concentrations of particulate iron and aluminum in river and shelf waters of the

eastern United States are indirectly related to salinity but show a loss greater than that from simple mixing. East coast concentrations of particulate iron are less than comparable west coast concentrations. (Gabriel-USGS)

ALKALINITY BUDGET OF THE COLUMBIA RIVER,
Oregon State Univ., Corvallis. Dept. of Oceanography; Federal Water Pollution Control Administration, Washington, D.C. Div. of Engineering Development; and Idaho Univ., Moscow. Dept. of Chemistry.
P. Kilho Park, George R. Webster, and Roy Yamamoto.
Limnology and Oceanography, Vol 14, No 4, p 559-567, July 1969. 9 p, 3 fig, 4 tab, 17 ref. Grants GP-2232, GP-2876, and GP-5317 (NSF) Res Contract Nonr-1286 (10)-ONR.

Descriptors: *Alkalinity, *River flow, *Columbia River, Carbonates, Water chemistry, Dissolved solids, Silicates, Calcium carbonate, Estuaries, River basins, Weathering, Sampling, Mapping, Phosphates, Nitrates, Streamflow, Discharge (Water).
Identifiers: Alkalinity budget.

Columbia River alkalinity essentially consists of carbonate alkalinity (94%) with some silicate alkalinity where dissolved silicate concentration is high. Phosphate and borate contribute insignificantly to the overall alkalinity. The river delivered 11 megatrons of calcium carbonate to the Pacific Ocean during the water year 1963. Regardless of high seasonal flow-rate variance, the river alkalinity near the river mouth shows little variation with an average value of 1 meq/liter. (Gabriel-USGS)
W70-02642

SOLUBILITIES OF NITROGEN, OXYGEN, AND ARGON IN DISTILLED WATER,
Amherst Coll., Mass. Dept. of Physics.
Cornelius E. Klots, and Bruce B. Benson.
Journal of Marine Research, Vol 21, p 48-57, 21, 1, 1963. 1 fig, 4 tab, 21 ref.

Descriptors: *Solubility, *Nitrogen, *Oxygen, *Argon, Temperature.
Identifiers: Bunsen absorption coefficient, Distilled water.

The solubilities of nitrogen, oxygen and argon in distilled water in the temperature range 2-27 deg C have been measured with an estimated accuracy of 0.1%. Both absolute and solubility ratio techniques were employed. Tabulations are present of the Bunsen absorption coefficients and Henry's law constants for nitrogen, oxygen and argon and the ratio of the absorption coefficients to those for nitrogen. The solubilities found by Fox, Winkler, Hamberg and others are compared. It is concluded that the values of oxygen solubility in Standard Methods are high except at the lowest temperatures, and the values of the ASCE research committee are slightly low above 15 deg C. (Rietveld-Vanderbilt)
W70-02701

SOLUBILITY OF ATMOSPHERIC OXYGEN IN WATER,
Harvard Univ., Cambridge, Mass. Sanitary Engineering Div.
J. Carrell Morris, Werner Stumm, and Hend A. Galal.
Journal of the Sanitary Engineering Division, Proceed of ASCE, Vol 87, SA 1, p 81-86, Jan 1961. 2 fig, 2 tab.

Descriptors: *Solubility, *Dissolved oxygen, Temperature, Saturation.
Identifiers: Winkler method, Bunsen absorption coefficient, Distilled water.

The apparatus for obtaining saturation of water with air at constant pressure and the apparatus for manometric determination of oxygen solubility are described in some detail. Two tables give the saturation values for oxygen in water as obtained by the above mentioned equipment. The data obtained by the TVA group are in concordance with this data, however, two facts are missing in the description of the Elmore and Hayes study: (1) if the air being equilibrated with water was saturated with water vapor, (2) no mention of correction of barometric prressures to standard conditions. This article is only a prediscussion of a more complete study for the USPHS. (Rietveld-Vanderbilt)
W70-02702

DETERMINATION OF DISSOLVED OXYGEN BY THE WINKLER METHOD AND THE SOLUBILITY OF OXYGEN IN PURE WATER AND SEA WATER,
Water Pollution Research Lab., Stevenage (England).
H. A. C. Montgomery, N. S. Thom, and A. Cockburn.
Journal of Applied Chemistry, Vol 14, p 280-296, July 1964. 4 fig, 11 tab, 65 ref.

Descriptors: *Solubility, *Dissolved oxygen, Seawater, Temperature.
Identifiers: Winkler method, Adeney-Becker law, Distilled water.

Values for the solubility of oxygen in water obtained by a modification of the Winkler method are shown to be low because of losses of iodine vapor. Iodine vapor is also lost in two of the standard modifications of the Winkler method in common use, the amount lost depending on the technique of the analyst. The volatilization of iodine can be avoided by the use of the alkaline iodide reagent of Pomeroy and Kirschman; a procedure employing this reagent is described. Interference by nitrites and ferric iron may be eliminated by sodium azide and phosphoric acid respectively. The accuracy of the Winkler method, modified to prevent the loss of iodine vapor, has been confirmed using gaseous oxygen as a standard. Using the procedure recommended, determinations have been made of the solubility of atmospheric oxygen in distilled water between 0.4 deg and 37 deg, and in sea water between 2 deg and 27 deg. The results for distilled water are in excellent agreement with those of Klots and Benson between 2 deg and 27 deg; the new values for sea water agree fairly well with those of Fox. The values in Standard Methods are shown to be high, except at the lowest temperatures, and the values of the ASCE research committee to be low above 15 deg C. In measurements of the rate of solution of oxygen, the approach to equilibrium using these values was consistent with the law of Adeney and Becker. This article contains 65 references. (Rietveld-Vanderbilt)
W70-02705

NEW MEASUREMENTS OF OXYGEN SOLUBILITY IN PURE AND NATURAL WATER,
Johns Hopkins Univ., Baltimore, Md. Dept. of Oceanography.
James H. Carpenter.
Limnol Oceanogr, Vol 11, p 264-277, 1966. 5 fig, 5 tab, 29 ref.

Descriptors: *Solubility, *Dissolved oxygen, *Temperature, *Chlorides, Seawater.
Identifiers: *Chlorinity, Titrimetric method, Gasometric method, Winkler method, Distilled water.

The measurements of oxygen solubility in distilled water and dilutions of seawater were made with the Winkler titrimetric method after an extended study of its errors. The system and instruments used are described. The measurements were made over the temperature range 0.5 deg to 35 deg C. Nonlinear dependence of oxygen solubility on chlorinity was found. Interpolation tables of the data have been prepared. The accuracy of the techniques was approximately 0.1%, so the tables appear to be more reliable than those in current use. Because many of the existing field data have been collected using techniques for the Winkler method that introduce significant systematic errors due to volatilization and air oxidation errors, the use of the reported solubility values with these field data will produce misleading results. The values determined agree well with the values of Klots and Benson, and with those of Montgomery, Thom, and Cockburn. This article contains 21 references. (Rietveld-Vanderbilt)

Connecticut Univ., Storrs. Inst. of Water Resources.
David A. Fisher, and James G. Daley.
Research Project Technical Completion Report, Nov 1970. 4 p, 7 tab. OWRR Project A-010-CONN.

Descriptors: *Seawater, *Enthalpy, *Entropy, *Specific heat.

The value of enthalpy of seawater concentrates above their value at 0 deg C has been determined in the temperature range 0 deg C to 200 deg C based on measurements made of the heat given off by samples of seawater when cooling, from some temperature to 0 deg C. These concentrates ranged from a salinity of 1% to 28%. From this data a polynomial expression for enthalpy has been determined which, together with other thermodynamic considerations, permits the evaluation of specific heat and entropy in this range of temperature and concentration. Tables have been prepared giving enthalpy, entropy and specific heat in this range for which the values of enthalpy and entropy at 0 deg C are based on the heat of mixing of sodium chloride solutions of equivalent dissolved solids.
W70-02749

AN INVESTIGATION OF THE STRUCTURAL CHEMISTRY OF YELLOW ORGANIC MATTER IN FRESH WATER,
Rhode Island Univ., Kingston. Dept. of Agricultural Chemistry.
George T. Felbeck, Jr.
Technical Completion Report, Rhode Island Water Resources Center, 1969. 6 p. OWRR Project A-018-RI.

Descriptors: *Yellow organic matter, *Humic acid, *Bacteria, *Fungi, *Fresh water, *Aquatic microflora.

Colonies of aquatic microflora were isolated from samples of highly colored pond water. From the large number of bacteria and fungi isolated on agar plates only a very few produced yellow-colored exudates when grown in a submerged culture. None of the pigments produced in this fashion were water soluble. The only yellow-colored water soluble materials that were obtained occurred in cultures of fungi grown under non-agitated conditions and with the presence of aerial mycelia. Therefore, these results are consistent with previous chemical evidence that the yellow-colored organic matter in fresh water is derived either directly from soil fungal products or indirectly through the breakdown of the soil humic acid polymers.

COMPARISON OF WIND WAVE AND UNIFORM WAVE EFFECTS ON A BEACH,
California Univ., Berkeley.
Peter Truman Kraai.
Shore and Beach, Vol 37, No 2, p 60-71, Oct 1969. 12 p, 19 fig, 1 tab, 18 ref.

Descriptors: *Waves (Water), *Beaches, *Sediment transport, *Model studies, Sands, Beach erosion, Bed load, Winds, Profiles, Ocean waves, Currents (Water), Deposition (Sediments), Littoral drift, Shores, Surf.
Identifiers: *Beach erosion models, Wave-making machines.

A series of two dimensional experiments were made in a wave channel to compare the nearshore beach profiles formed by wind-generated waves with the profiles formed by periodic machine-generated waves. Although equilibrium was easily obtained in the case of uniform periodic wave exposure, it was not possible to achieve equilibrium when the beach was exposed to wind waves. The basic current systems differed in the offshore zone for the two cases. No theoretical equilibrium beach profile exists for the case of a beach exposed to locally generated wind waves. The basic mechanism for the movement of sand seaward during the winter season is the offshore bottom current which is a result of the wind setup experienced during intense local storms in the winter. (Knapp-USGS)

SALT-WATER ENCROACHMENT INTO AQUIFERS.

Proceedings of Symp held at Louisiana State Univ, Baton Rouge, May 4-5, 1967. Louisiana Water Resources Research Institute Bulletin 3, Louisiana State University, Oct 1968. 192 p, 38 fig, 15 tab, 91 ref. OWRR Proj No A-004-LA.

Descriptors: *Saline water intrusion, *Aquifers, Hydrogeology, Water management (Applied), New York, Florida, California, Groundwater movement, Surface-grownd water relationships, Water law, Legal aspects, Drainage, Withdrawal, Administrative agencies.
Identifiers: Aquifer management.

A symposium record contains discussions of salt water encroachment into aquifers in Florida, New York and California, Management of aquifers, encroachment control, hydrogeology, and legal aspects of encroachment. Each discussion consists of a paper presented as a preprint, a short introductory statement by the author, and discussion by the symposium participants. (See also W70-02485 thru W70-02492). (Knapp-USGS)
W70-02484

COMBATING SALT-WATER ENCROACHMENT INTO THE BISCAYNE AQUIFER OF MIAMI, FLORIDA,
Dade County Engineering Dept., Miami, Fla.
F. D. R. Park
Louisiana Water Resources Research Institute Bulletin 3, Louisiana State University, p 31-56, Oct 1968. 26 p, 14 fig, 2 tab, 16 ref. OWRR Proj No A-004-LA.

Descriptors: *Saline water intrusion, *Aquifers, *Florida, *Water management (Applied), Legal aspects, Water law, Water conservation, Land management, Drainage, Withdrawal, Administrative agencies.
Identifiers: Water quality management.

Urbanization of Dade Co., Florida and attempts to drain the Everglades have lowered the water table. During periods of drought, the current withdrawal rate of fresh water allows salt-water intrusion. Recharge from rainfall periodically pushes salt water to the sea. It is desirable to artificially hold a high water level to offset intrusion during droughts. Salinity dams, prevention of further primary drainage, and navigation channels are used in salinity control. Little opposition has been encountered in enforcement of the salt barrier line on private lands. The main enforcement difficulties are caused by the Public Works and Mosquito Control Units. Court decisions subordinate riparian rights to the public need of an uncontaminated fresh water supply. Lesser pollution problems arise from industrial and domestic discharges. An effective answer lies in county-wide sewage collection and disposal. (See W70-02484). (Knapp-USGS)
W70-02485

SALT-WATER INTRUSION IN SOUTHEASTERN FLORIDA,
Central and Southern Florida Flood Control District, West Palm Beach, Fla.
Robert Grafton.
Louisiana Water Resources Research Institute Bulletin 3, Louisiana State University, p 15-30, Oct 1968. 16 p, 1 fig. OWRR Proj No A-004-LA.

Descriptors: *Saline water intrusion, *Aquifers, *Florida, *Water management (Applied), Aquifers, Hydrogeology, Surface-grownd water relationships, Water law, Legal aspects, Water conservation, Land management, Drainage, Withdrawal, Administrative agencies.
Identifiers: Water quality management.

Overdrainage as a result of urbanization and geological conditions resulted in salt-water intrusion into southeastern Florida. After massive flood damage in 1957 and 1958, the Central and Southern Florida Flood Control District was established to acquire lands, represent local interests, raise funds, and operate projects in cooperation with the Federal Government to promote flood control and water preservation. Further legislation is required to broaden the scope of the F.C. D., especially in salt-water intrusion. With the exception of Dade and Broward Counties, little is being accomplished by counties under the guidance of the State Board of Conservation, Department of Water Resources. Increased population is endangering lands committed to conservation areas. However, activities by special agencies against salt-water intrusion in southeastern Florida continue to gain momentum. (See W70-02484). (Knapp-USGS)

PLANNING AND PROVIDING AN ADEQUATE SUPPLY OF WATER FOR ORANGE COUNTY, CALIFORNIA,
Orange County Water District, Santa Ana, Calif.
Howard W. Crooke.
Louisiana Water Resources Research Institute Bulletin 3, Louisiana State University, p 89-103, Oct 1968. 15 p, 2 tab. OWRR Proj No A-004-LA.

Descriptors: *Water management (Applied), *Saline water intrusion, *Aquifers, *California, *Artificial recharge, Pit recharge, Water spreading, Injection wells, Water law, Legal aspects, Overdraft, Taxes.
Identifiers: *Water quality management, *Orange County (Calif).

In the past 17 years, the Orange County Water District of California has purchased more than 1.7 million acre-feet of water to recharge and replenish the Orange County groundwater basin. This water, which was brought 300 miles from the Colorado River, cost $22.5 million. About one-third of this was financed from advalorem taxes levied on all real property within the District; two-thirds was financed from replenishment assessments levied on all water produced from the groundwater supply and paid by those who pumped the water. This extensive replenishment is an integral part of a groundwater management program geared to meet the water needs of an area that has experienced an unprecedented and continuing economic boom. (See W70-02484). (Knapp-USGS)

Louisiana Water Resources Research Institute Bulletin 3, Louisiana State University, p 59-87, Oct 1968. 29 p, 9 fig, 2 tab, 26 ref. OWRR Proj No A-004-LA.

Descriptors: *Saline water intrusion, *Aquifers, *New York, *Water management (Applied), *Artificial recharge, Saline water-freshwater interfaces, Reclaimed water, Water law, Legislation, Legal aspects, Hydrogeology, Desalination.
Identifiers: Water quality management.

Salt water intrusion in New York involves only the perimeter of Long Island. The problem is compounded by direct contact between the aquifers and the ocean. All Long Island groundwater comes from infiltration with approximately 50% absorption into the aquifers. Since 1933, legislation has been enacted to regulate the groundwater extraction and to license well drillers. The main causes of salt-water intrusion are overpumpage and a reduction in availability of recharge water as a result of urbanization. Projects undertaken to relieve overpumpage are: (1) reservoirs to collect surface water, (2) acquiring pumping rights of sparsely populated areas, and (3) construction of a desalination plant. Plans are under way to salvage 97 mgd of presently wasted sewage water for injection. Presently Long Island is using 15 acres of recharge basins with a capacity of 57 million gallons. Present efforts, such as recharging, are being offset by wasteful sewage discharge. (See W70-02484). (Knapp-USGS)

THE CHALLENGE OF WATER MANAGEMENT: ORANGE COUNTY WATER DISTRICT, CALIFORNIA,
Orange County Water District, Santa Ana, Calif.
Langdon W. Owen.
Louisiana Water Resources Research Institute Bulletin 3, Louisiana State University, p 105-125, Oct 1968. 21 p, 5 fig, 2 tab. OWRR Proj No A-004-LA.

Descriptors: *Water management (Applied), *Saline water intrusion, *Aquifers, *California, *Injection wells, Artificial recharge, Observation wells, Water reuse, Reclaimed water, Groundwater barriers, Water quality.
Identifiers: *Water quality management, *Orange County (Calif).

The technical aspects of effective basin management of Orange County, California water supplies are described. Reliance has been placed on both surface water and groundwater to meet county needs. Surface water is obtained from the Colorado and Santa Ana Rivers and direct precipitation. Groundwater comes from the South Coastal Basin. Feasible use of these sources is dependent on safe withdrawal of large volumes of groundwater during periods of surface water shortage and the ability to sink large quantities of water into the basin when surplus surface water is available. Salt-water intrusion will be controlled by a hydraulic barrier of in-

jection wells. The major problem encountered in injecting reclaimed and surface water is the quality of the available water. Blending of surface water and groundwater provides a desirable composite water source. Computer models have greatly facilitated working knowledge of the groundwater basin operation. (See W70-02484). (Knapp-USGS)

THE HYDROGEOLOGIC SETTING IN LOS ANGELES COUNTY, CALIFORNIA,
Los Angeles County Flood Control District, Calif., Water Conservation Div.
Clinton Milne.
Louisiana Water Resources Research Institute Bulletin 3, Louisiana State University, p 127-151, Oct 1968. 25 p, 8 fig, 7 tab, 11 ref. OWRR Proj No A-004-LA.

Descriptors: *Hydrogeology, *Saline water intrusion, *Aquifers, *California, *Artificial recharge, Water management (Applied), Geology, Injection wells, Drawdown, Water resources development.
Identifiers: *Water quality management, Aquifer management, Los Angeles County (Calif).

Over 80% of the water levels in the principal aquifers underlying the 470-square mile coastal plain area of Los Angeles County, California are below sea level. As a result, aquifers of Pleistocene age, situated at depths down to 750 feet in the critical areas, have been intruded by sea water. The volume of this intrusion is estimated to be 700,000 acre feet. Artificial replenishment is accomplished by the spreading of local storm runoff and the injection of both imported Colorado River water and reclaimed water. Management of grownd water basins will maintain below sea level the water tables underlying most of the coastal plain. Sea-water intrusion will be prevented by the injection of fresh water, which will also provide a major portion of the groundwater replenishment. (See W70-02484). (Knapp-USGS)
W70-02490

THE AMELIORATION OR PREVENTION OF SALT-WATER INTRUSION IN AQUIFERS - EXPERIENCE IN LOS ANGELES COUNTY, CALIFORNIA,
Los Angeles County Flood Control District, Calif.
Arthur E. Bruington.
Louisiana Water Resources Research Institute Bulletin 3, Louisiana State University, p 153-168, Oct 1968. 16 p, 1 fig, 8 ref. OWRR Proj No A-004-LA.

Descriptors: *Water management (Applied), *Saline water intrusion, *Injection wells, *California, Groundwater barriers, Artificial recharge, Aquifers, Water reuse, Construction costs, Operating costs.
Identifiers: *Water quality management, *Los Angeles County (Calif).

Underground storage from winter storms is used in Los Angeles County, California with the pressure-ridge method for recharge of the aquifers for deterring saline intrusion. A line of injection wells create a pressure field much like a continuous curtain wall. Waterlogging has been controlled in low areas by seaward extraction along with pressure-ridge injection. Injected water must be of high quality to prevent clogging of wells, increase well life, and reduce well-cleaning costs. Observation wells are needed at critical points along the barrier line to monitor the groundwater elevation. The location of the barrier line has allowed a certain amount of salt water to be cut off, or trapped behind the barrier. The cost of injected water for 1966, $13.00 per acre-foot did not include the cost of supply water, amortized capital outlay per well, pipelines, and other appurtenances. The uncompleted pressure-ridge system is working as planned. (See W70-02484). (Knapp-USGS)

LEGAL AND ECONOMIC ASPECTS OF SALT-WATER ENCROACHMENT INTO COASTAL AQUIFERS,
Bookman and Edmonston, Glendale, Calif.
Max Bookman.
Louisiana Water Resources Research Institute Bulletin 3, Louisiana State University, p 169-192, Oct 1968. 24 p, 30 ref. OWRR Proj No A-004-LA.

Descriptors: *Saline water intrusion, *Aquifers, *Water management (Applied), *California, *Legal aspects, Costs, Economics, Administrative agencies, Flood control, Artificial recharge, Water reuse, Water rights, Water law.
Identifiers: Water quality management, Los Angeles County (Calif).

An integral part of salt-water intrusion prevention is control and reduction of groundwater production, which, in Los Angeles County, California, required court action. Legislative action was also necessary to empower local water districts to construct, operate, and finance salt-water prevention facilities. At present, 70% of the water is imported. Implementation of controls was a 3-step process: (1) sharing of imported river water with upstream owners; (2) injunctions against Coastal and Central basin pumpers; and (3), establishment of a salt-water barrier. Barrier financing came through advalorem taxes and district general funds. Other legislation provided for financing enforcement. Salt-water prevention in the West Coast basin is administered by 6 state and local agencies and one citizens' association. This arrangement has proved successful and economical. The control of pumping and reduction of groundwater use by pricing is not sufficient to halt salt-water intrusion. Court actions and their consequences are an important economic factor. (See W70-02484). (Knapp-USGS)

THE TRANSFORMATION OF A SOLITARY WAVE OVER AN UNEVEN BOTTOM,
Massachusetts Inst. of Tech., Cambridge. Hydrodynamics Lab.
O. S. Madsen, and C. C. Mei.
Journal of Fluid Mechanics, Vol 39, Part 4, p 781-791, Dec 1969. 11 p, 7 fig, 3 tab, 19 ref.

Descriptors: *Waves (Water), *Mathematical models, *Hydraulic models, Numerical analysis, Mathematical studies, Frequency, Energy, Beaches, Continental shelf.
Identifiers: Wave transformation.

Based on a set of approximate equations for long waves over an uneven bottom, numerical results show that as a solitary wave climbs a slope the rate of amplitude increase depends on the initial amplitude as well as on the slope. Results are also obtained for a solitary wave progressing over a slope onto a shelf. On the shelf a disintegration of the initial wave into a train of solitary waves of decreasing amplitude is found. Experimental evidence is also presented. (Knapp-USGS)

GRAVITY WAVES OVER A NON-UNIFORM FLOW,
Technische Hogeschool Twente, Enschede (Netherlands).
H. G. M. Velthuizen, and L. Van Wijngaarden.
Journal of Fluid Mechanics, Vol 39, Part 4, p 817-829, Dec 1969. 13 p, 5 fig, 8 ref, append.

Descriptors: *Waves (Water), *Mathematical models, Mathematical studies, Numerical analysis, Viscous flow, Hydraulics, Energy, Equations, Boundary layers, Critical flow, Non-uniform flow.
Identifiers: Viscous hydrodynamics.

Propagation of small amplitude gravity waves over a flow with non-uniform velocity distribution is analysed. Viscous effects which are the cause of damping or growth are important in the wall layer near the bottom and also at the critical depth, which is present when the wave speed is between zero and the fluid velocity at the free surface. The basic equations for the problem are given. Exchange of momentum and energy between wave and primary flow is discussed. Illustrations of the theory are given for long waves over running flow and for the flow along a ship advancing in a wavy sea. In these examples a negative curvature of the mean velocity profile is shown to have a stabilizing effect. (Knapp-USGS)

CURRENT STUDY IN THE NEUSE RIVER AND ESTUARY OF NORTH CAROLINA,
North Carolina Univ., Morehead City. Inst of Marine Sciences.
William J. Woods.
Available from the Clearinghouse as PB-188 905, $3.00 in paper copy, $0.65 in microfiche. Report No 13, Water Resources Research Institute of the University of North Carolina, Dec 1969. 35 p, 4 tab, 17 fig, 10 ref. OWRR Project A-020-NC.

Descriptors: *Estuaries, *Currents, Inflow, Streamflow.
Identifiers: *Neuse river, Current study, *Tidal prism.

Two Rhodamine B dye insertions were made in the lower 59 km of the Neuse River Estuary during the summer of 1967. Movement of the dye was followed with Turner Model 111 Fluorometers. Time-of-travel estimates of the dye patch were made for the two insertions. Under meteorological conditions existing at the time of the study a mean flushing time of six days and a maximum flushing time of 7.4 days is estimated for the lower 28.2 km of the Neuse River Estuary. A mean flushing time of 12.3 days and a maximum flushing time of 19.25 days is estimated for the 30.8 km of the river immediately below New Bern, North Carolina. A maximum flushing time of 26 to 27 days is estimated for the lower 59 km of the Neuse River Estuary for conditions existing during the summer of 1967. Further measurements are suggested. STUDY OF A DESIGN-OPTIMIZATION PROCEDURE FOR ION-EXCHANGE AND ADSORPTION COLUMNS,
California Univ., Berkeley.
S. Pancharatnam, G. Klein, and T. Vermeulen.
Available from the Superintendent of Documents, US Government Printing Office, Wash DC, 20402, for $1.25 per copy. Office of Saline Water Research and Development Progress Report No 477, Sept 1969. 113 p. OSW Grant 14-1-0001-1698.

Descriptors: *Desalination process, *Ion-exchange, *Sorption.
Identifiers: *Sorption processes, *Fixed-bed, *Regeneration cycle, Process-design.

Optimal design of large-scale ion-exchange systems involves predictions of the effluence concentration under repeated cycles of incomplete exhaustion-regeneration. This report describes the exploratory study of a way to make such predictions, and of their use in optimization procedures. Controllable variables for a specified process are column dimensions, flow rates and running times which give rise to dimensionless length-time values. Output results are the recoveries and purities of desired components in effluent fractions and consequent cost functions. Graphs prepared as described in this report determine how optimally to design or operate a column. A computer program is described which utilizes a 'ridge-climbing' technique to find the economically optimum design. Input to the program includes cost factors for resin, regenerant, apparatus, and power, and correlation constants obtained from a mass-transfer model of the system. Output comprises the optimum combination of bed height and exhaustion flow rate. (Filban-Office of Saline Water)

AXIAL-DISPERSION CONSTANT-PATTERN KINETICS OF ION-EXCHANGE AND ADSORPTION COLUMNS,
California Univ., Berkeley.
Robert E. Quilici, and Theodore Vermeulen.
Available from the Superintendent of Documents, US Government Printing Office, Wash DC, 20402, for $1.00 per copy. Office of Saline Water Research and Development Progress Report No 476, Sept 1969. 95 p. OSW Grant 14-01-0001-1698.

Descriptors: *Desalination process, *Ion-exchange, *Adsorption.
Identifiers: *Adsorption processes, *Fixed-bed separation, Process design.

Engineering design of ion-exchange and adsorption columns for large-scale use has been hindered by the absence of precalculated breakthrough curves of a general nature, which should be available for rapid calculation of practical systems. As an adjunct to research on multicomponent ion exchange sponsored by the Office of Saline Water, attention is being given at the University of California to certain unsolved problems in two-component ion exchange and one-component adsorption in which the solutions are still needed for engineering purposes. Among such problems is the effect of 'longitudinal mixing' or 'axial dispersion' in beds of packed spheres. At low flow rates or with large sorbent particles, axial dispersion may produce a spreading of the concentration breakthrough curves for fixed-bed separations in addition to the spreading given by the mass-transfer resistance alone. The combined effects of axial dispersion and mass transfer have been studied for four controlling exchange mechanisms or models -- external mass transfer, solid diffusion, pore diffusion, and reaction kinetics. Tabulated results of numerical solutions are given for the constant-pattern case, involving constant separation factors from r= 0 to r= 0.7, for dispersion/mass-transfer ratios beta from near zero to 10. SUITABILITY OF THE UPPER COLORADO RIVER BASIN FOR PRECIPITATION MANAGEMENT,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
Hiroshi Nakamichi, and Hubert J. Morel-Seytoux.
Colorado State University Hydrology Paper No 36, Oct 1969. 62 p, 12 fig, 8 tab, 58 ref, 2 append. Contract No BR 14-06-D-6597 (Bur of Reclam).

Descriptors: *Precipitation (Atmospheric), *Management, *Colorado River Basin, *Cloud seeding, Demonstration watersheds, Research and development, Statistical methods, Hydrologic aspects, Runoff forecasting, Hydrograph analysis, Seasonal.
Identifiers: *Precipitation management, Pilot program, Suitability criteria, Upper Colorado Basin.

Watershed suitability for weather modification over the entire Upper Colorado River Basin is discussed from the hydrologic standpoint. Determination of watershed or groups of watersheds for precipitation management programs was a primary objective of the study, particularly in the San Juan Mountains and the upper part of the Colorado basin. A relationship between precipitation and spring runoff with greater than 0.90 correlation coefficient was obtained for 365 sets of gaged subbasins by applying a multiple linear regression analysis, the independent variables being winter and spring precipitation. Assuming a uniform 10% increase in winter precipitation on the upper Colorado River basin, calculations show that three years of operations are needed for evaluation in that basin versus six years in the San Juan Mountains. WATER IN THE KAHUKU AREA, OAHU, HAWAII,
Geological Survey, Washington, D.C.
K. J. Takasaki, and Santos Valenciano.
Geol Surv Water-Supply Paper 1874, 1969. 59 p, 29 fig, 1 plate, 7 tab, 21 ref.

Descriptors: *Water resources, *Groundwater, *Surface waters, *Hawaii, Aquifers, Basalts, Water levels, Water wells, Hydrogeology, Hydrologic data, Data collections, Water quality, Water yield, Streamflow, Springs, Infiltration, Rainfall, Climates, Topography.
Identifiers: *Kahuku (Hawaii), Oahu.

The Kahuku area of Oahu, Hawaii comprises the north end of the Koolau Range and its bordering coastal plain. A 2 1/2-mile-wide dike zone of parallel and subparallel dikes along the crest is the remnant of the fissure zone of eruption. Outcrops are mostly permeable lava flows of the Koolau Volcanic Series, which are intruded by dikes inside the dike zone and are free of dikes outside it. The lava flows constitute main aquifers, and water bodies in them are called dike water inside the dike zone and basal water outside it. Basal water occurs on either side of the dike zone. The quality of dike water is excellent except near the north end, where it is slightly contaminated by infiltration of irrigation water that contains as much as 1,200 mg/l chloride. The major contaminant, however, is sea water. In the Kahuku subarea--where pumpage from the basal-water body is greatest--sea-water contamination is a major concern. Natural contamination by encroaching sea water extends more than 2 miles inland in the Waimea-Kawela subarea and generally precludes development of large quantities of basal water. At low altitudes where the perennial flow is small, all streams are intermittent

except Kaluanui and Kamananui. Streamflow cannot be economically developed and is not a reliable source of water supply. Average rainfall is about 240 mgd. Groundwater flow is estimated to be 85 mgd. The most promising areas for developing basal water are in the Hauula and Laie subareas. The development of dike water is promising in the Waimea-Kawela subarea. (Knapp-USGS)

Available from Superintendent of Documents, US Government Printing Office, Wash DC, 20402 - Price $2.00. Office Saline Water Research and Development Progress Report No 489, Oct 1969. 158 p, 10 fig, 5 dwg, 69 tab, 28 ref.

Descriptors: *Desalination processes, *Water costs, *Irrigation, *Water quality, Irrigated land, Land reclamation, Electrodialysis, Flash distillation, Desalination plants, Brine disposal, Boron, Cost analysis, Waste disposal.
Identifiers: Sodium adsorption ratio, Multistage flash distillation.

The water quality benefits associated with desalted irrigation water at concentrations of 400, 900, and 1,500 parts per million were determined for three irrigated areas in Arizona and California. Desalination for irrigation is most favorable in areas producing crops that yield high net farm incomes under yearlong growing seasons. Irrigation developments of about 10,000 acres require large-scale multistage flash distillation plants utilizing nuclear energy, but electrodialysis is more favorable for smaller irrigated areas. The sodium adsorption ratio and boron content of product water must be reduced to assure sustained productivity. Benefit-cost analysis indicates that 400 ppm (TDS) is the optimum product water quality. Unit water cost was least in larger plants. A serious problem associated with inland desalting is brine disposal. (Carstea-USGS)

OPTIMIZING SALVAGEABLE WATER RESOURCES IN A SEMI-ARID INLAND BASIN,
Arizona Univ., Tucson.
W. Clyma, W. G. Matlock, W. J. McConnell, H. K. Qashu, and S. D. Resnick.
Available from the Clearinghouse as PB-188 933, $3.00 in paper copy, $0.65 in microfiche. Project Completion Report, Arizona Water Resources Center, Aug 1969. 45 p, 5 tab, 9 fig, 10 ref. OWRR Project A-011-ARIZ.

Descriptors: *Water reuse, *Natural recharge, Treatment, Water management (Applied), Arid lands.

This investigation characterizes salvageable water resources in the semi-arid Tucson basin and evaluates appropriate treatment and control methods and management procedures for reuse of these salvageable waters. A preliminary inventory of salvageable water resources in the Tucson basin indicated a conservatively estimated annual total of 30,000 acre-feet available from municipal, industrial, and urban runoff sources. Little was known of the quality of urban runoff in this semi-arid environment, and efforts were directed toward exploratory sampling and analysis as indicators of potential problem areas in runoff quality. A groundwater recharge investigation at the Rillito Creek recharge site near Tucson produced a mathematical model which can be applied to alternative management schemes in the utilization or storage of salvage waters. Initial formulation of management alternatives appeared to require an improved system framework defining community objectives and criteria for salvaged water allocation. (DeCook-Arizona)

The Conservation Commission is authorized to contract with public or private agencies for research and development of a toxic material for the control and eradication of carp in state waters. The Commission is further authorized to establish and maintain state fish hatcheries and care for and protect all state forests. The Commission may acquire needed access routes to lands under its control which are surrounded by privately owned lands. The Commission shall periodically report to the Governor on its activities and on the results of its investigations. Such reports shall be accompanied by appropriate recommendations for the conservation and preservation of the state's natural resources. A Natural Resources Committee of state agencies is created to coordinate conservation programs of the several participating agencies. The Committee shall investigate and make recommendations to the state agencies and to the legislature concerning soils, waters, fish, forests, wildlife, and other natural resources of the state. It is a misdemeanor to unreasonably waste or maliciously impair or destroy any natural resource of the state. (Dearing-Florida)

3E. Conservation in Industry

WATER FOR INDUSTRIAL DEVELOPMENT IN COVINGTON, JEFFERSON DAVIS, LAMAR, LAWRENCE, MARION, AND WALTHALL COUNTIES, MISSISSIPPI,
Geological Survey, Jackson, Miss. Water Resources Div.
R. E. Taylor, C. P. Humphreys, Jr., and D. E. Shattles.
Geol Surv - Mississippi Research and Development Center Cooperative Rep, 1968. 114 p, 56 fig, 19 tab, 18 ref, 3 append.

Descriptors: *Water resources, *Mississippi, Groundwater, Surface waters, Streamflow, Water wells, Water quality, Hydrogeology, Hydrologic data, Data collections, Water resources development, Industrial water, Aquifers.
Identifiers: *Lamar County, Covington County, Jefferson Davis County, Marion County, Walthall County, Lawrence County.

Covington, Jefferson Davis, Lamar, Lawrence, Marion, and Walthall Counties in south-central Mississippi possess surface and groundwater in quantities capable of supporting large industrial and municipal developments. The area uses an aggregate of 9.7 mgd, and present industrial and municipal supplies are obtained predominantly from groundwater. However, more than 7 times this daily rate of withdrawal has been allocated from the Pearl River alone for a new industry. The largest single source of fresh water in the area is the Pearl River. Even during a 10-year drought, natural flow of the Pearl increases from 160 mgd at the northern Lawrence County line to 700 mgd at the southern Marion County line. This 540 mgd pickup in flow, as the river passes through the study area, is furnished mostly by tributary streams which are among the highest yielding streams in Mississippi. Water in the streams is of good quality, even though some wastes are discharged to the streams. Sedimentary aquifers of Eocene to Holocene age contain the fresh groundwater. Aquifers of Miocene age are available throughout the 6 counties. These aquifers not only supply present indus-

trial and municipal water demands but offer the greatest wateresupply potential in the area. Transmissibility values calculated for Miocene aquifers ranged from 2,400 to 400,000 gpd per foot, and for the Pearl River alluvium the value was 35,000 gpd per foot. Specific capacities of wells range from less than 1 to 70 gpm per foot of drawdown. The groundwater is of generally good quality and requires little or no treatment for most uses. (Knapp-USGS)

THE ECONOMIC IMPACT OF IRRIGATED AGRICULTURE ON THE ECONOMY OF NEBRASKA,
Nebraska Univ., Lincoln. Dept. of Economics.
Theodore Roesler, F. Charles Lamphear, and M. David Beveridge.
Nebr Econ and Bus Rep No 4, Nebr Univ, Sept 1968. 59 p, 36 tab, 7 chart, 3 append.

Descriptors: *Irrigation, *Economics, *Kansas, *Input-output analysis, *Economic impact, Mathematical models, Simulation analysis, Operations research, Systems analysis, Cost analysis, Agriculture, Benefits.
Identifiers: *Irrigation economics.

The economic effects of irrigation on the economy of Nebraska were studied by input-output analysis. Nebraska is one of the West North Central states. With its 77,227 sq mi of area, it ranks fifteenth among the states in land area. It had a population of 1,411,000 in 1960, ranking 34th. Its per capita personal income in 1963 was $2,312, 25th among the states and 94% of the U.S. average of $2,449. The total induced by effect of irrigated agriculture in 1963 was $157.0 million. Households show the biggest impact, experiencing increased income of over $5,200. This includes not only the increased personal income of farmers but also increases in the personal incomes of all persons engaged in supplying needed inputs to the Irrigated Crops Sector. The Real Estate and Trade Sectors experienced the next largest increases in transactions. (Knapp-USGS)

STUDIES IN THE TECHNIQUES OF FIELD TRIALS IN RANGE LANDS: I. SIZE, SHAPE AND ARRANGEMENT OF PLOTS,
Central Arid Zone Research Inst., Jodhpur (India).
M. B. Jain.
Annals of Arid Zone, Vol 6, No 2, p 129-137, 1967. 4 tab, 14 ref.

Descriptors: *On-site investigations, *Arid lands, *Range management, *Range grasses, *Research and development, Statistics, Ranges, Natural resources, Vegetation, Plant populations, Desert plants, Statistical models, Costs, Economics, Economic efficiency.
Identifiers: *India, *Experimental designs, Research efficiency, Experimental error, Experimental efficiency, Plots.

In India enormous livestock population and resulting overgrazing are causing rapid deterioration of range lands. Thus the livestock economy is causing deterioration of natural resources and is becoming a drag on the whole economy. Improved range management is a must and necessarily depends on sound research. The author reports a study intended to improve research efficiency through better experimental plot design for Indian conditions. Trials were conducted on 'poor' condition range land in arid western Rajasthan, India. The author concludes that small plots require less experimental area (hence less natural variation) and are most economical from the standpoint of land. On the other hand, a large number of small plots with a large proportion of border area is expensive from the standpoint of fencing and labor. For Indian conditions the author concludes that long term grazing studies should be conducted on plots large enough to meet year round requirements without causing deterioration of the range. Plot size would vary according to carrying capacity of different range lands. Plot shape has to be nearly square to minimize fencing costs. To reduce error the experimental area should be stratified on the basis of vegetative composition. The problem of decreased efficiency with increased size suggests confounded designs for factorial treatments, and incomplete blocks for varietal trials. The arrangement of plots should always be as compact as possible. (Crouse-Arizona)

STUDY ON THE PASTURE ESTABLISHMENT TECHNIQUE: III. EFFECT OF INTERCROPPING WITH DIFFERENT LEGUMES ON THE GROWTH AND FORAGE PRODUCTION OF DHAMAN (CENCHRUS CILIARIS) AND SEWAN (LASIURUS SINDICUS) PASTURES IN THE ESTABLISHMENT YEAR,
Central Arid Zone Research Inst., Jodhpur (India).
H. S. Daulay, A. K. Chakravarty, and G. N. Bhati.
Annals of Arid Zone, Vol 7, No 2, p 265-269, 1968. 7 tab, 1 fig, 6 ref.

Descriptors: *Legumes, *Arid lands, *Range management, *Revegetation, *Soil mosture, *Productivity, Water conservation, Ranges, Range grasses, Forages, Pasture management, Root zone, Costs, Economics, Grazing, Sands, Crop production, Seeds, Fertility.
Identifiers: *India, *Rajasthan, Intercropping.

In arid western Rajasthan 80% of the range land is in poor condition from over grazing and produces less than 300 kg. per hectare. Reseeding has proven difficult although of vital importance to the livestock industry. The authors report a one year study of the effect of mixing important range grasses - dhaman (Cenchrus ciliaris) and sewan (Lasiurus sindicus) - with three common legumes, mung (Phaseolus radiatus), moth (Phaseolus aconitifolius) and guar (Cymopsis tetragonoloba). A split-plot design with 4 replications was run on sandy soil at Jodhpur. There were 7 treatment combinations at 3 fertility levels. Intercropping of dhaman and sewan with the legumes produced an increase in forage yield of 20 to 30% compared with grass alone. Under arid conditions best increases in yield were with moth and guar. Estimated increases in income during the first year were (Rs. 249.46) per hectare with moth and (Rs. 208.75) with mung. An additional benefit was soil moisture conservation when dhaman was mixed with legumes. At the end of the first season soil moisture under dhaman - legume mixtures was higher at the 25, 50, and 75 cm. depths. No such increase occurred with sewan mixtures. (Crouse-Arizona)

EXPRESSING IRRIGATION EFFICIENCY IN TERMS OF APPLICATION TIME, INTAKE AND WATER ADVANCE CONSTANTS,
Texas Water Rights Commission, Basin Hydrology Section; and Utah State Univ., Logan. Dept. of Agricultural and Irrigation Engineering.
Yu-Si Fok, and A. A. Bishop.
American Society of Agricultural Engineers, Transactions, Vol 12, No 4, p 438-442, 1969. 2 tab, 6 fig, 11 ref.

Descriptors: *Irrigation efficiency, *Irrigated land, *Consumptive use, *Arid lands, *Timing, Irrigation practices, Surface irrigation, Application methods, Water conservation, Agricultural engineering, Equations, Rates of application, Water reuse, Runoff.
Identifiers: *Water advance equation

In arid and semiarid lands surface irrigation constitutes more than 75% of consumptive use of water. Therefore, an increase in irrigation efficiency of only 10 percent will result in saving a large amount of water for use elsewhere. Drawing on available literature, the authors develop mathematical and graphical expressions of irrigation efficiency in terms of application time, intake and water advance constants. Application efficiency is shown to be a dependent variable of the exponent of the intake and the water advance equations, and the ratio of intake time to water advance time. Proper use of these three variables can result in higher application efficiency. In practice, however, only the time ratio is easily manageable. Therefore, for each farm the length of irrigation run should be designed to achieve a high time ratio. (Crouse-Arizona)

This paper is the published form of a lecture given by the author in memory of Mr. Jack Wright, an English irrigation authority who designed, manufactured, and installed irrigation systems in many arid lands of the world. There is a brief review of the 4,000-year history of irrigation in arid lands of the Ancient World and of meteorological and topographic causes of aridity. The author compares a moderate rainfall zone in England with a semiarid zone of Australia to illustrate that aridity is often the result of a combination of high evaporative potential and relatively low rainfall - not just sparse rainfall. Because arid lands usually occur in areas with high levels of sunshine, application of irrigation water on suitable soils can result in high crop yields or even several crops per year. The need for sufficient water and adequate drainage to prevent salinity is covered briefly. The author estimates some 400 million acres are irrigated around the world, supporting about 400 million people at present. With increased fertilizers and technology, this area might support between 800 and 1200 million people. Unfortunately, potential for increasing the actual area under irrigation is low in precisely those areas where excess population is most critical: Pakistan, India and China. (Crouse-Arizona)

Identifiers: *Tunisia, *Mediterranean climate, *Agricultural processing plants, *Majardah Basin, Resettlement.

In Tunisia the area with the best potential for large scale irrigation is the Majardah Basin. The scheme is based on a French plan based on Marshall Plan funds. After independence the plan, which originally emphasized irrigation, was revised to include conservation and changes in land use and tenure based on the agrarian reform law of 1958. The area extends over 741,000 acres of the valley north to the Mediterranean. The river is fed by winter rains typical of the semiarid Mediterranean climate. Storage reservoirs are necessary to conserve the irregular river flow. The soils are fertile alluvium which supported prosperous agriculture in Roman times. Lower valley soils are heavy and require drainage systems. The goal is to irrigate 176,000 acres by 1971. Three multipurpose dams store water, control flooding and dilute saline waters. The irrigation canal system and drainage systems are described briefly. Erosion problems in the drainage basin are being controlled by terracing and reforestation. Land use plans are converting cultivation from extensive grains to intensive high value crops for the Tunis and European markets. Land reform has limited holdings to 150 acres and vastly increased the number of land owners. Agricultural product processing plants are being established. Already there has been a large increase in productivity and per capita income. (Crouse-Arizona)

SPRINKLER IRRIGATION SPRAY TEMPERATURES,
Agricultural Research Service, Kimberly, Idaho. Soil and Water Conservation Research Div.; and Agricultural Research Service, Kimberly, Idaho. Snake River Research Center.
C. H. Pair, J. L. Wright, and M. E. Jensen.
American Society of Agricultural Engineers, Transactions, Vol 12, No 3, p 314-315, 1969. 1 tab, 3 fig, 7 ref.

Descriptors: *Irrigation water, *Sprinkler irrigation, *Water temperature, *Temperature control, *Micrometeorology, Irrigation, Temperature, Soil temperature, Cooling, Idaho, Soil-water-plant relationships, Heating, Crop response, Drops (Fluids).
Identifiers: *Wet-bulb temperature, Snake River Valley.

Temperatures of irrigation water may vary from near zero to 90 C where the source is a hot spring. As more nuclear power plants are installed, streams into which waste water is discharged may also become heated. It is important to know what the water temperature is when it comes in contact with the crop or soil. Temperature can affect seed germination, growth, fruit developments, response to frost and crop-cooling operations. In theory droplets from sprinkler irrigation should approach the wet-bulb temperature of the air. The authors describe an experiment conducted in southern Idaho to test this theory. They found that near zero temperature of irrigation water increased to within 1.8 C of wet-bulb temperature and decreased from near boiling to within 3.4 C of wet-bulb temperature when applied by sprinkler. Heating of as much as 8 C and cooling of approximately 75 C were recorded. There was little variation in temperature with distance from the sprinkler. (Crouse-Arizona)

MULTIPLE USE OF MEDITERRANEAN RANGE LANDS; NEW APPROACHES TO OLD PROBLEMS,
Technion - Israel Inst. of Tech., Haifa. Dept. of Agricultural Engineering.
Z. Naveh.
Annals of Arid Zone, Vol 7, No 2, p 163-177, 1968. 1 tab, 2 fig, 29 ref.

Descriptors: *Multiple purpose projects, *Semiarid climates, *Land use, *Range management, *Decision making, Recreation demand, Arid lands, Agriculture, Arable land, Natural resources, Vegetation, Reforestation, Brush control, Carrying capacity, Conservation, Grazing, Surveys, Ecology, Watershed management, Pine trees, Grasses, Shrubs, Goats, Forests, Optimum development plans, Pasture management.
Identifiers: *Israel, *Mediterranean climate.

In Israel and other arid and semiarid Mediterranean lands increasing populations have put great pressure on food supplies from arable lands. A new look at renewable natural resources of the much abused rangelands is in order. The author estimates that from 40 to 64% of the land area of these countries is in hilly wildlands unsuitable for tillage. The climate is typically mediterranean with long, hot and very dry summers. These lands are generally overgrazed and eroded and yield low productivity. In recent years the trend has been to convert these lands to forestry and close them to grazing. Other areas have been taken over by unproductive but tenacious woody shrub species which in effect closes them to grazing. The author proposes a more flexible policy toward these wild lands which would permit utilization such as forestry, grazing, recreation, watershed management or possibly a combination of some or all of these. The decisions should be based on careful surveys of the site potential and local needs. Research is needed to provide a sound basis for dynamic programming of optimum land use. (Crouse-Arizona)

Identifiers: *USSR, Soviet Central Asia.

To identify the irrigation drainage systems and crops best suitable for land development in the Golodnaya Steppe, Soviet Central Asia, experimental drainage systems for growing rice, cotton, and grass were investigated using some selected steppe plots. Intensive irrigation of lands located in the southeastern part of Golodnaya Steppe leads to basic changes in the water and salinity regimes of the soil. Moreover, the present methods of reclamation, as conducted in the steppe, do not guarantee satisfactory reclamation of irrigated lands. (Gabriel-USGS)

DRAINAGE RIGHTS.

R I Gen Laws Ann secs 46-20-1, 46-20-3 (1956).

Descriptors: *Rhode Island, *Drainage, *Drains, *Ditches, Legislation, Legal aspects, Drainage practices, Damages, Cities, Construction, Relative rights, Local governments, Administration, Decision making, Adjudication procedure, Administrative decisions.
Identifiers: *Drainage rights, Hearings.

Landowners desiring to drain their land but who are unable to obtain the consent of owners of land to be affected may petition their town council for power to drain their lands. The petition will set forth the course of the proposed drain and the names of the proprietors whose lands are to be affected thereby. The town council will hear the parties in interest and may appoint three disinterested parties to recommend the best drainage method and a fair damage award for the adversely affected party. The town council will make such orders based on the report as it deems lawful and right. (Keith-Florida)

CLAIMS AGAINST AND CONTRACTS WITH OTHER DISTRICTS AND MUNICIPAL CORPORATIONS EXERCISING DRAINAGE POWERS.

111 Ann Stat ch 42, secs 11-1 thru 11-17 (Smith-Hurd 1956), as amended, (Supp 1969).

Descriptors: *Illinois, *Drainage systems, *Drainage districts, *Cost allocation, Legislation, Administration, Regulation, Drainage, Drainage programs, Drainage engineering, Drainage practices, Administrative agencies, Judicial decisions, Cost sharing, Operation and maintenance, Adjudication procedure, Cost-benefit analysis, Cost repayment.
Identifiers: Penalties.

Any drainage district may connect its drains or levees to the drains or levees of another district. When work done by one drainage district benefits another, the benefitted district is liable for the just proportion of the cost of the work. Claims between districts may be settled by written contract, but such contract must be approved by the court having jurisdiction over the districts. Procedures are provided for hearings to fix the proportionate share of costs when districts are unable to agree. Judgement may be for money damages relating directly

to the amount of annual benefits between the parties. The judgement also constitutes the measure of liability between the districts for repair, maintenance and operation of the work. Any two or more adjoining drainage districts may establish joint systems. (Moulder-Florida)

PETITION TO COURT FOR DRAINAGE AND APPOINTMENT OF COMMISSIONERS.

Pa Stat Ann tit 3, secs 721-736 (1963).

Descriptors: *Pennsylvania, *Drainage, *Surface drainage, *Land development, Agricultural engineering, Legislation, Legal aspects, Subsurface drainage, Surface waters, Drains, Damages, Regulation, Excavation, Maintenance, Overflow, Swamps, Marshes, Surveys, Costs, Estimated costs, Drainage effects, Controlled drainage, Groundwater, Relative rights.
Identifiers: *Drain construction, Public nuisance.

When landowners desire to improve their land for agricultural purposes by surface or subsurface drains and such drains must be extended over or under the land of others to be effectual, the land owners must present a petition to the court of quarter sessions of the county where the land is located. The court will appoint viewers to make a feasibility study of the proposed drains and to report to the court the estimated damages which will be caused by the construction of the drains. The report will be accompanied by a plot of the proposed drains. The court will not confirm the report until damages have been paid to the parties to be injured, and drain construction will not begin until confirmation of the report. The petitioner and his successors in interest must keep the drains in repair or have them closed. A similar procedure is provided to cover the situation where the joint and several owners of swamp land desire to have their land drained, but if such land is deemed a public nuisance by the examining commissioners, the townships in which it lies may be apportioned part of the drainage expense. (Keith-Florida)

CITIES' POWER OVER WATERCOURSES.

Pa Stat Ann tit 53, secs 38401-38409 (1957).

Descriptors: *Pennsylvania, *Cities, *Watercourses (Legal), Jurisdiction, Rivers, Streams, Dams, Dam construction, Federal Government, Water resources development, Sanitary engineering, Waste disposal, Local governments, Legislation, Banks, Bank protection, Channels, Channel improvement, Beds, Confined water, Damages, Eminent domain, Condemnation, Navigable waters, Water sources, Water supply.

Cities may by ordinance establish the lines of banks, change channels, beds, and mouths of watercourses through lands or waters in or adjacent to the city. Cities may also crib, wall, confine, pave, inclose, prevent and remove obstructions, or build dams. For such purposes the power of eminent domain may be exercised. Notice of any such action must be given, and viewers are appointed to assess damages. These provisions shall not apply to any watercourse used by any municipality or water company as a source of supply. Whenever the consent of the federal government has been granted to a city to construct a dam in a public navigable river or stream for improving sanitary conditions, such city may take private property for that purpose. (Smith-Florida)
W70-02524

CITIES OF THE SECOND CLASS: POWERS RELATING TO LEVEES, FERRIES, WHARVES, CHANNELS, PIERS, AND INFLUENT PIPES.
Pa Stat Ann tit 53, sec 23138, 23139, 23155 (1957)

Descriptors: *Pennsylvania, *Cities, *Water supply, *Piers, Pipelines, Pumped storage, Reservoir operation, Reservoir storage, Water storage, Water tanks, Water wells, Water works, Influent streams, Engineering structures, Structures, Aqueducts, Pipes, Transportation, Conveyance structures, Wells, Legislation, State governments, Levees, Navigable waters, Channel improvement, Docks.
Identifiers: *Ferries.

Cities of the second class in Pennsylvania shall have the general powers necessary to: (1) provide for the construction and maintenance of levees and ferries within the city limits; (2) erect and regulate wharves on navigable waters adjacent to the city; (3) establish wharf and dock lines; (4) establish and change the channels of watercourses, and to wall and cover them; (5) establish and regulate public wells, cisterns, aqueducts, and reservoirs of water, and to fill the same; and (6) lay influent pipes of water works out into the bed of adjacent rivers, and to build a pier, for the purpose of procuring a pure water supply. Piers and influent pipes when laid must not obstruct navigation. (Marsee-Florida)
W70-02525

INTERFERENCE WITH DRAINAGE FACILITIES.

Pa Stat Ann tit 53, sec 57067 (1957).

Descriptors: *Pennsylvania, *Drainage systems, *Obstruction to flow, *Permits, Drainage, Drainage practices, Local governments, Drainage programs, Outlets, Pipes, Sewers, Storm drains, Water control, Water sources, Drains, Ditches, Culverts, Legislation, Legal aspects.

No person shall interfere with any drainage facility in a township without first submitting plans to the town commissioners for their approval. The commissioners may hold public hearings, alter the plans, and may grant complete or conditional approval. No drainage facility shall be interfered with except in strict accordance with plans so approved. Said commissioners may enter upon any lands or enclosures and maintain and repair drains or ditches as necessary to carry water from streets or highways. Nothing contained herein shall restrict the normal duties and powers of the State Department of Highways, any county, or the Water and Power Resources Board. (Smith-Florida)
W70-02526

FLOOD CONTROL.
Pa Stat Ann tit 32, secs 651, 654, 658-665 (1967), as amended, (Supp 1969).

Descriptors: *Pennsylvania, *Flood control, *Floodproofing, *Flood protection, Flood routing, Channel improvement, Check structures, Dams, Dikes, Diversion, Drainage systems, Flood forecasting, Flow control, Levees, Bridges, Highways, Reservoirs, Recreation facilities, Warning systems, Eminent domain, State governments, Federal government, Administrative agencies, Water resources development, Legislation.

The Department of Forests and Waters is authorized to survey sections of the Susquehanna River and prepare plans for the widening, deepening, removal of obstructions, repair of walls or changing the channel in order to obviate flood dangers. The Water and Power Resources Board is empowered to make surveys and plans for a proposed flood control district to control, store, preserve, and regulate the flow of rivers and streams to diminish or eliminate floods. Official plans are effective and the flood control district is established when the Board completes suitable plans. In carrying out official plans the Board may improve or alter the channel of any river, install flood warning systems, fill up any abandoned water course, construct dams, levees, and other flood control works which regulate rivers' flow, construct bridges, construct any other works needed for flood control. Lakes and reservoirs so constructed may be used for recreation. The Board may receive federal flood control aid. The Board shall have the power of eminent domain, and the power to authorize the federal government to acquire property or rights outside the Commonwealth at the Board's expense. (Smith-Florida)

OBSTRUCTIONS NOT TO BE MADE OR ALTERED WITHOUT CONSENT.
Pa Stat Ann tit 32, secs 682-691 (1967)

Descriptors: *Pennsylvania, *Supervisory control (Power), *Dams, *Flood protection, Administrative agencies, Permits, Construction, Obstruction to flow, Highways, Bridges, Local governments, State governments, Flood control, Repairing, Legislation, Legal aspects, Regulation, Investigations.
Identifiers: Obstructions.

No person, corporation, municipality or county may construct any dam or other water obstruction or any addition thereto, or change and diminish the course or current of any body of water within the state unless authorized by the Water and Power Resources Board. Each application to the Board for such authorization shall be accompanied by complete maps and specifications of such water obstruction. The Board may impose restrictions upon a permit to construct or alter a water obstruction. The Board may investigate any dam or water obstruction now in existence, and may determine whether such structure is unsafe or in need of repair. The Board shall notify the owners of needed repairs or of the necessity of removal of any structure. This act extends to all types of water obstructions regardless of the date of construction. If the condition of the obstruction is so dangerous to public safety as to create an emergency, the obstruction may be removed or repaired without notice to the owner. The act shall not apply to private streams of a limited size. The act vests neither powers of eminent domain nor authority of other commissions in the Board. (Kelly-Florida)
W70-02534

PYMATUNING SWAMP DAM.

Pa Stat Ann tit 32, secs 762-773 (1967).

Descriptors: *Pennsylvania, *Dam, *Regulated flow, *Reservoirs, Construction, Alteration of flow, Condemnation, Area redevelopment, Recreation, Hunting, Fishing, Land use, Costs, Operation and maintenance, Management, Operations, Swamps, Drainage systems, Water supply, Water conservation, Legislation, Legal aspects, Regulation, Land development, Administrative agencies, Supervisory control (Powers).

The Department of Forests and Waters is hereby authorized to have a dam constructed and/or completed across the outlet of Pymatuning Swamp for the purpose of regulating water flow. The Department shall have plans and specifications prepared to construct the dam so as to conserve water, regulate the flow, and maintain as regular a flow as possible throughout the year. The reservoir and adjacent land acquired in connection with the project may be developed and used for recreation, hunting, fishing or game refuges. The Water and Power Resources Board is vested with complete authority concerning the use and development of the land and water within the project. The Department may use condemnation proceedings to acquire needed lands. The Department is authorized to obtain releases from landowners in Ohio whose property may be injured as a result of project construction. The Department may enter

agreements with persons or agencies in Ohio for removal or relocation of utility lines or roads. The Department may sell or lease lands, and sell timber or improvements on state lands where such transaction will be beneficial to the state. When the dam and reservoir are completed, the Department will be responsible for the maintenance and operation. (Kelly-Florida)
W70-02536

LOCATION AND IMPROVEMENT OF RIVERS AND STREAMS.
Pa Stat Ann tit 32, secs 807-811 (1967).

Descriptors: *Bank stabilization, *River training, *Pennsylvania, *River regulation, River beds, Streams, Dams, Impoundments, Boundaries (Property), River flow, Wildlife conservation, Water resources development, Bank erosion, Channel improvement, Stream stabilization, Legal aspects, Legislation, Administrative agencies, Regulated flow, Water policy, Stream improvement.

The Water and Power Resources Board of the Department of Forests and Waters is authorized to determine the course and define the location, width, and depth of any river or stream within the state, except the tidal waters of the Delaware River. The Board is hereby empowered to protect the bed and banks of any streams, build dams, retaining walls, and other structures for the purpose of regulating the flow of such streams or rivers, for the prevention of percolations from streams through holes in the beds or banks thereof, and for protection of wildlife and reparian owners. The Board shall record the location of a river or stream so fixed in the county deed records. The Board shall have the power to enter private lands for purposes of this act. Any damages sustained by any property owner, as a result of actions by the Board in fulfilling its statutory duties, shall be paid by the Department of Forests and Waters. (Kelly-Florida)

DELAWARE RIVER BRIDGES.
Pa Stat Ann tit 36, secs 3191, 3201, 3211, 3251, 3271, 3321, 3341, 3371 (1961).

Descriptors: *Pennsylvania, *Bridges, *Interstate rivers, *Interstate commissions, State governments, Governments, Interstate compacts, River basin commissions, Rivers, Streams, Delaware River, Delaware River Basin Commission, Eminent domain, Condemnation, Bridge construction, Parks, Public lands, Highway relocation, Road construction, Highways, New Jersey, New York, Legislation.

Whenever the Commonwealth shall acquire and maintain any toll bridge, the Board of Commissioners of Public Grounds and Buildings may lease to any adjacent borough or township, for public park purposes only, any lands acquired in connection with such bridge which are not required for highway purposes. The Department of Highways is authorized and directed to erect a toll bridge over the Allegheny River. In the construction of said bridge, the Department shall have all powers conferred with respect to relocation, widening or construction of highways, including eminent domain. 'Bridges' between Pennsylvania and New York are defined. The New Jersey Act for the protection of bridges over the Delaware River is hereby declared to be of force in this state. 'Bridges' between Pennsylvania and New Jersey are defined. Certain sums of money are appropriated for a commission to build and acquire toll bridges over the Delaware River in conjunction with a similar commission of New Jersey. Such commission is created to act as a joint commission with New Jersey commission and is authorized to determine the proper location of certain additional bridges. (Smith-Florida)
W70-02546

DELAWARE RIVER JOINT TOLL BRIDGE COMMISSION.
Pa Stat Ann tit 36, sec 3401 (1961), as amended, (Supp 1969).

Descriptors: *Pennsylvania, *New Jersey, *Interstate commissions, *Bridges, Interstate compacts, Bridge construction, Eminent domain, Condemnation, Delaware River Basin Commission, Delaware River, Rivers, Road construction, Highways, State governments, Port authorities, Legislation, Interstate rivers, Operation and maintenance, Administrative agencies, Harbors.

The Governor is authorized to enter into a compact with the State of New Jersey to create the Delaware Joint Toll Bridge Commission. Said Commission shall administer, operate, and maintain all joint state-owned bridges across the Delaware River and shall investigate and prepare plans for new bridges over said river. Said Commission is empowered to conduct all its affairs according to law, acquire and dispose of property, exercise the power of eminent domain, erect certain new bridges, charge and collect fees and tolls, acquire and operate port and terminal facilities, including the dredging of ship channels and turning basins, and exercise all other powers reasonably necessary to effectuate its authorized purposes. 'Port and terminal facilities' are defined. The Commission is empowered to acquire, construct and operate bridges at specified locations, to replace existing bridges, to acquire by purchase or condemnation any existing ferry or bridge in connection with the construction of a new bridge, to build or improve any road or highway in connection with a bridge project, and to demolish or remove any bridge which is to be replaced. (Smith-Florida)
W70-02547

REGULATION OF DAM AND MILLWAY CONSTRUCTION AND OPERATION.
Iowa Code Ann secs 469.1 to 469.31 (1949), as amended, (Supp 1969).

Descriptors: *Iowa, *Permits, *Dam construction, *Dams, Administrative agencies, Legislation, State governments, Cities, Legal aspects, Electric power, Hydroelectric plants, River regulation, Regulation, Washouts, Navigable rivers, Streams, Navigation, Riparian rights, Eminent domain, Embankments, Water utilization, Industrial water, Water pollution control, Highways, Waterfalls.

No dam may be constructed, maintained, or operated in any navigable or meandered stream for any purpose, or in other streams for manufacturing or power purposes, nor may any water be taken from such streams for industrial purposes, unless the Iowa Natural Resources Council has granted a permit therefor under the procedures established herein. Where the water is to be used for manufacturing purposes other than power development, no permit may be issued until the Iowa Water Pollution Control Commission has certified its approval of the water's use. Permits must also be obtained where dams affect highways or state-owned lands. This act also provides for: (1) permit allowance criteria; (2) dam construction and operation regulation; (3) nuisance proceedings to abate dams violating the act; (4) condemnation of lands for dams; (5) the construction of embankments on the land of others for bank protection; (6) the right to utilize falls below dams; (7) revocation of permits; (8) permits for existing dams; and (9) the assessment of damages arising from embankment construction and condemnation. Cities and towns may by complying with this act construct dams. (Marsee-Florida)

POWERS, RIGHTS, AND PRIVILEGES OF RAILROAD CORPORATIONS TO CROSS WATERCOURSES.
Miss Code Ann secs 7723, 7742 (1956).

Descriptors: *Mississippi, *Railroads, *Bridges, *Bodies of water, Legislation, Navigable waters, Non-navigable waters, Bridge construction, Boats, Docks, Streams, Rivers, Operation and maintenance, Construction, Transportation, Navigation, Mechanical equipment, Legal aspects.

Except as limited, or otherwise prescribed by federal statute or regulations, railroad corporations have the authority to contruct, maintain, or operate railroads under, over, or across any body of water which lies along its route; build and maintain bridges, landings and wharves; and operate any type of watercraft necessary in the conduct of its business. Whenever a navigable body of water is crossed by a bridge, a draw or swing sufficient to allow the passage of boats must be maintained. (Casey-Florida)
W70-02572

FLOOD CONTROL.
Miss Code Ann secs 4769-4771, 4773, 4774, 4776, 4782, 4789, 4790, 4792-4795, 4800, 4802, 4803, 4803-01, 4805-4808, 4810, 4815-4817, 4819, 4826-01 (1956).

Descriptors: *Mississippi, *Administrative agencies, *Flood control, *Project planning, Legislation, Administration, Federal government, State governments, Flood protection, Water management (Applied), Floodways, Conveyance structures, Projects, Federal project policy, Watershed management, Flood routing, Levees, Right-of-way, Engineering structures, Bypasses, Operation and maintenance, Maintenance costs, Operation costs, Highway relocation, Eminent domain.
Identifiers: *Flood control districts.

Flood control districts are established to participate in federal flood control projects at the local level. Petition requirements for establishing such districts are provided, as are the duties of the court-appointed examining engineer. The federal project plan is filed as the official plan of the district. The District Commissioners are given corporate powers. Commissioners are authorized to cooperate in the construction and maintenance of project works, to acquire necessary land, to relocate highways, and to exercise powers of eminent domain. Provisions are made for the enlargement and combination of districts and for cooperation between districts. Commissioners are empowered to obstruct watercourses and to provide for artificial bypasses for floodwaters. Preliminary and maintenance expenses may be financed by loans and ad valorem taxation of property within the districts. Districts continue after the completion of the official plan for the maintenance and protection of works constructed under the plan. (Douberley-Florida)
W70-02573

FLOOD CONTROL.

Miss Code Ann secs 4769-4771, 4773, 4774, 4776, 4782, 4789, 4790 (1956).

Descriptors: *Flood control, *Administrative agencies, *Project planning, *Project purposes, Flood protection, Rivers and Harbors Act, Water management (Applied), Overflow, Floodways, Conveyance structures, Engineering structures, Federal government, State governments, Administration, Projects, Administrative costs, Engineers estimates, Estimated costs, Watershed management, Federal project policy, Programs, Tax, Costs, Tax rate, Highway relocation.
Identifiers: *Flood control districts.

The court of chancery has jurisdiction to establish flood control districts to cooperate with the federal government in the implementation of federal flood control projects. A majority of the county supervisors may petition the chancellor to establish a district. The federal flood control proposal, the necessity for improvements, their purpose, the area to be protected, and a proposed name must be included

in the petition. A court-appointed engineer makes a feasibility study, accurately describes the lands involved, reports on the extent of all required improvements and their cost, and files the plan of the chief of engineers of the War Department with the chancellor. After proper notice, a hearing is held on the petition. The chancellor's order may be appealed by an elector, property owner, or any other person affected. The district commissioners have corporate powers, and are to adopt an official plan for the district with approval of the chancellor. Preliminary expenses are paid by an ad valorem tax upon property within the district. The commissioners may assure the federal government that the county will bear the expense for necessary highway alterations. (Douberley-Florida)
W70-02574

FLOOD CONTROL.

Miss Code Ann secs 4792-4795, 4800, 4802, 4803, 4803-01 (1956).

Descriptors: *Flood routing, *Floodways, *Highway relocation, *Projects, Flood control, Diversion structures, Drainage systems, Flood protection, Levees, Reservoirs, Reservoir operation, Watershed management, Floodproofing, Design flow, Right-of-way, Embankments, Sluice gates, Spillways, Pumping plants, Ditches, Channels, Conduits, Conveyance structures, Engineering structures.

Flood control districts are empowered to acquire property rights within or without the district to accomplish their purposes, and may bargain with land owners or settle claims for damages. They are empowered to cooperate with federal agencies in the construction and maintenance of necessary works and are to assure the federal government that works will be maintained, that highway relocations and damages will be supplied by the state, and that lands and easements will be provided. Commissioners have the power of eminent domain, using the same procedures as public utility condemnation procedures. The districts may cooperate with other districts within limits, and they may enlarge or combine with other districts upon petition to the chancellor. Commissioners may alter the official plan for works and improvements in accordance with changes in the original federal plan. Districts have the right to obstruct or dam any natural watercourse and to provide for artificial bypasses for flood waters so long as the water is returned to its natural watercourse. The power to construct bypasses is also granted to existing districts in protected levee areas. (Douberley-Florida)
W70-02575

FLOOD CONTROL.
Miss Code Ann secs 4805-4808, 4810, 4815, 4816, 4817, 4819, 4826-01 (1956).

Descriptors: *Financing, *Government finance, *Loans, *Taxes, Costs, Interest, Interest rate, Administrative costs, Initial costs, Maintenance costs, Operating costs, Reimbursable costs, Cost repayment, Tax rate, Cost sharing, Maintenance, Repairing, Operation and maintenance, Operations, Legislation, Bench marks.

Flood control district commissioners may, with approval of the chancellor, borrow funds to cover preliminary expenses to be paid from district funds, or if no works are constructed, an ad valorem tax may be levied. The tax is assessed annually until preliminary expenses, including expenses for highways and acquisition of property rights, are paid. An annual ad valorem tax may also be levied for maintenance and repair of flood control works and improvements. Emergency loans may be made, to be repaid from the first maintenance taxes thereafter collected. Commissioners may borrow money to make necessary highway improvements and to purchase property rights and interests. Reimbursements made by the federal government may be used by the commissioners. Upon completion of the official plan, districts will continue to maintain the works constructed under the plan. Commissioners have the right to police the works, compel citizens to help protect the works in great emergencies, and to prevent damage by prohibiting persons, vehicles or livestock from passing over works. Removal of bench marks or other reference marks is a misdemeanor. (Douberley-Florida)

THE LAW OF SURFACE WATER IN MISSOURI,
Lawrence O. Davis.
Mo L Rev, Vol 24, Nos 2, 3, p 137-165; 281-317, Apr, June 1959. 66 p.

Descriptors: *Missouri, *Surface waters, *Water law, *Legal aspects, Watercourses (Legal), Floodwater, Natural flow doctrine, Appropriation, Civil law, Reasonable use, Drainage districts, Levees, Legislation, Drainage, Surface drainage, Obstruction to flow, Alteration of flow, Terracing, Impoundments, Impounded waters, Judicial decisions, Railroads, Cities, Riddance (Legal aspects), Repulsion (Legal aspects).

Written in two installments, this article is broken into four major divisions. The first division discusses the distinguishing characteristics of surface water and watercourses, and devotes special attention to the status of floodwater as surface water. The second division deals with the law of surface water in general, with subdivisions including: (1) the civil law rule or natural flow theory; (2) the common law or common enemy rule; (3) the reasonable use rule; and (4) the civil law and common enemy rules in practice. The third major division covers the history of Missouri surface-water law. Lastly, the fourth division sets forth present Missouri surface-water law and discusses in subdivisions: (1) appropriation; (2) municipal corporations; (3) railroads; (4) drainage and levee districts; (5) statutory private drainage rights; (6) liability for the escape of water incidental to impounding; (7) blocking of water by a proprietor at his upper property line; (8) the privilege of the upper owner to alter flow; and (9) terracing for water management. (See also W70-02578 thru W70-02583). (Marsee-Florida)
W70-02577

THE LAW OF SURFACE WATER IN MISSOURI,
Lawrence O. Davis.
Mo L Rev, Vol 24, No 2, p 137-145, Apr 1959. 9 p.

Descriptors: *Missouri, *Watercourses (Legal), *Surface waters, *Surface runoff, Legal aspects, Judicial decisions, State governments, Artificial watercourses, Intermittent streams, Natural streams, Ephemeral streams, Streams, Running waters, Bogs, Fen, Marshes, Swamps, Surface drainage, Ditches, Drainage water, Floodwater, Water types, Flooding, Water law.

While it is obvious that the term surface water does not include percolating groundwater, surface water must also be distinguished from water in a natural watercourse. This is necessary because of the different treatment afforded each by Missouri courts. The usual approach to distinguishing between surface water and watercourses is a negative approach in that all waters not meeting the requirements of a natural watercourse are labeled as surface waters. The question is one of fact depending upon the physical situation. As typified by the Missouri cases discussed, the question is often close, especially as relates to drainways and sloughs. Paramount considerations in classifying a particular body of water are the source of the water, continuity of flow, the physical characteristics of the drainway, and the general lay of the land. As regards floodwater, Missouri treats all overflow as surface water whether or not such overflow remains contiguous with the main channel. There is one exception: where the overflow temporarily escapes from the stream and runs through a defined channel back into the main body of water, it is still regarded as part of the watercourse. (See also W70-02577) (Marsee-Florida)
W70-02578

THE LAW OF SURFACE WATER IN MISSOURI,
Lawrence O. Davis
Mo L Rev, Vol 24, No 2, p 145-154, Apr 1959. 10 p.

Descriptors: *Missouri, *Appropriation, *Riddance (Legal aspects), *Repulsion (Legal aspects), Surface waters, Legal aspects, Water law, Drainage, Drainage water, Surface drainage, Surface runoff, Reasonable use, Alteration to flow, Obstruction to flow, Relative rights, State governments, Judicial decisions, Prior appropriation, Artificial watercourses, Cities, Natural flow, Natural flow doctrine.

Relatively few cases deal with the appropriation of surface water; however, as a general rule a landowner has the absolute right to use the surface water on his land. Some jurisdictions qualify the rule by allowing appropriation only insofar as necessary to a reasonable use of the land. Determining liability to adjoining owners for the obstruction or repulsion of surface water is a more difficult matter. Three separate rules have developed to make such a determination: (1) the civil law rule makes liable a person who interferes with the natural flow of surface waters to another's detriment; (2) the common enemy rule gives each landowner unlimited privilege to drain or obstruct the surface water on his land; and (3) the reasonable use rule makes an owner liable only for unreasonable modifications to the natural flow. The civil law and common enemy rules have been criticized and have been modified in practice. The civil law rule has been held inapplicable to urban property, while the common enemy rule has been modified to prohibit the artificial discharge of water in a concentrated body upon lower land. Other minor exceptions are mentioned. (See also W70-02577). (Marsee-Florida)
W70-02579

THE LAW OF SURFACE WATER IN MISSOURI,
Lawrence O. Davis.
Mo L Rev, Vol 24, No 2, p 154-165, Apr 1959. 11 p.

Descriptors: *Missouri, *Judicial decisions, *Riddance (Legal aspects), *Repulsion (Legal aspects), Surface waters, Water law, Legal aspects, Drainage, Drainage water, Surface drainage, Surface runoff, Natural flow, Alteration of flow, Obstruction to flow, Railroads, Relative rights, State governments, Watercourses (Legal), Impoundments, Impounded waters, Reasonable use.

Since the case of Abbott v Kansas City, St. J and C.B.R.R., 83 Mo 271 (1884), which adopted the common enemy rule, the theory of surface water law in Missouri has never been seriously questioned. Prior to that, however, there was confusion as to what rule Missouri would follow. Some cases indicated that the civil law rule was followed; others indicated that the common enemy rule was favored. This historical discussion places these older cases in proper perspective to avoid misunderstanding of their significance today. (See also W70-02577). (Marsee-Florida)
W70-02580

THE LAW OF SURFACE WATER IN MISSOURI,
Lawrence O. Davis.
Mo L Rev, Vol 24, No 3, p 281-283, June 1959. 3 p.

Descriptors: *Missouri, *Appropriation, *Repulsion (Legal aspects), *Surface waters, Legal aspects, Riddance (Legal aspects), Water rights,

Priorities, Beneficial use, Percolating water, Groundwater, Judicial decisions, State governments, Overflow, Flooding, Water law.

This second installment of a two-part article on the surface water law of Missouri deals with the application of the common enemy rule in Missouri. While not directly governed by the common enemy doctrine, the landowner's right to appropriate the surface water on his land is also discussed. The extent of such appropriation has never been directly decided in Missouri; however, inasmuch as the common enemy doctrine is presumable based on the theory that every proprietor has complete dominion over the soil, it would seem logical that the right to appropriate would be practically unlimited. Some jurisdictions have applied the same rules of appropriation to both surface water and water percolating through the ground in no definite channel. A Missouri case has regarded such percolating water as a part of the soil but nevertheless prohibited malicious interference by the proprietor with its flow. This case could be extended to prevent malicious appropriation of surface water if surface water and percolating water are to be treated alike. Overflow water of a stream is generally treated as surface water in Missouri for appropriation purposes. (See also W70-02577). (Marsee-Florida)
W70-02581

THE LAW OF SURFACE WATER IN MISSOURI,
Lawrence O. Davis.
Mo L Rev, Vol 24, No 3, p 283-289, June 1959. 6 p.

Descriptors: *Missouri, *Cities, *Drainage districts, *Railroads, Surface waters, Legal aspects, Water law, Judicial decisions, Legislation, Municipal water, State governments, Levees, Repulsion (Legal aspects), Riddance (Legal aspects), Obstruction to flow, Alteration of flow, Drainage, Drainage water, Impoundments, Relative rights, Embankments, Roadbanks.
Identifiers: *Municipal corporations.

Because of its activity in street improvement and sewer construction, the municipal corporation is often involved in surface water litigation. Several cases are discussed as examples. Although it would appear that municipal corporations are favored due to their public nature, it may be that the liability of such corporation for the interference with the surface drainage is the same as that of a private individual. Much Missouri surface water litigation has resulted from railroad construction. An early case adopted the rule that a railroad must, if there is a watercourse nearby, provide openings through their roadbeds, and suitable ditches, so as to afford sufficient drainage. This idea has today been embodied in a Missouri statute. Considerable litigation has centered around the activities of statutorily created drainage and levee districts. The rights of landowners within such districts are governed by statute and contract. As to landowners outside the district, however, the district is a legal entity and treated much as an individual or political subdivision of the state. No special rules exist governing the common law rights of these districts. (See also W70-02577). (Marsee-Florida)

THE LAW OF SURFACE WATER IN MISSOURI,
Lawrence O. Davis.
Mo L Rev, Vol 24, No 3, p 289-298, June 1959. 9 p.

Descriptors: *Missouri, *Repulsion (Legal aspects), *Riddance (Legal aspects), *Impounded waters, Surface waters, Drainage, Surface runoff, Obstruction to flow, Alteration of flow, Barriers, Diversion, Relative rights, Judicial decisions, Legal aspects, Legislation, Impoundments, Drainage districts, Levees, Embankments, Drainage water, Earth dams, Railroads, Cities, Farms, Water law.

After discussing some statutes relating to private drainage rights, this article deals with a landowner's liability in Missouri for impounded surface water which either escapes or backs up onto another's land. From three Missouri cases considered, it is concluded that there is no liability for the escape of impounded surface water unless the escape is in a concentrated volume, or is the natural result of the impoundment or unless negligence is involved. Where the lower owner causes water to back up onto an upper owner's land, Missouri cases indicate that the lower owner is not liable if he blocks the water on the property line, but is liable if he does so elsewhere. This result is criticized. Blocking water at the property line may have two effects: the water may form a pond behind the embankment on the higher land, or it may be diverted across the lands of a third party. Missouri courts have made no distinction between these situations as relates to the liability of the impounder. Blockage as relating to urban areas, farming areas, and drainage and levee districts is discussed. (See also W70-02577). (Marsee-Florida)

PUBLIC LANDS AND SWAMPS - SALES - PUBLIC USE.
Wis Stat Ann secs 24.11 (3), 24.14, 24.145 (1964).

Descriptors: *Wisconsin, *Public rights, *Federal reclamation law, *Swamps, Public lands, Access routes, Contracts, Grants, Easements, Water rights, Mining, Mineralogy, Land reclamation, Patents, Federal-state water rights conflicts, State jurisdiction, Levees, Drains, Streams, Rivers, Ponds, Lakes.
Identifiers: *Public access, *Water-power rights.

Every contract, sale, or grant of public lands and waters shall reserve to the people the right of access for any purpose to such lands or streams, rivers, ponds, or navigable lakes bordered by such lands. There is further reserved all rights necessary to the full enjoyment by the people of such public lands and waters and all minerals therein. Such contract or conveyance is also subject to continued ownership by the state of all water-power rights and mineral removal rights on such lands. Any person who has purchased from the United States or entered any lands patented to this state as swamp and overflowed lands prior to the execution of such patents to the state, whose entry has been cancelled by the United States due to the subsequent patent to the state may purchase from the state such lands as were in the original patent from the United States at that original price. None of the swamp and overflow lands nor any proceeds from the sale of such lands are needed for the purpose of reclaiming such lands. These lands and the proceeds of their sale shall be made a part of the normal school fund. (Dearing-Florida)

WATER REPELLENT SOILS: A WORLDWIDE CONCERN IN MANAGEMENT OF SOIL AND VEGETATION,
Forest Service, (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
L. F. DeBano.
Agricultural Science Review 7 (2): 11-18. Second quarter 1969.

Descriptors: *Soils, *Waterproofing, *Burning, *Soil fungi, Soil physical properties, Peat, Turf, Surfactants, Moisture availability, Erosion, Plant diseases, Organic compounds, Soil mechanics, Water conservation, California, Water harvesting, Watershed management.
Identifiers: *Water repellent soils, Wildfires, Wetting agents.

Water repellency affects the management of large areas throughout the world. Seemingly unrelated problems such as plant diseases, subsidence of peat bogs, and soil erosion may be caused by poor wettability in some situations. Organic substances produced by plants or micro-organisms can induce water repellency in soils. High soil temperatures may further intensify water repellency in areas burned by wildfires. Mechanical and chemical remedial treatments have been used to increase the wettability and productivity of these problem soils. Waterproofing soils artificially has been found beneficial for highway engineering and water harvesting purposes.
W70-02686

DESIGN OF A COMBINED SEWER FLUIDIC REGULATOR, THE DEVELOPMENT OF BASIC CONFIGURATIONS AND DESIGN CRITERIA FOR APPLICATIONS OF FLUIDS IN SEWER REGULATORS.
Bowles Engineering Corp., Silver Spring, Md.

Available from the Clearinghouse as PB-188 914, $3.00 in paper copy, $0.65 in microfiche. FWPCA Water Pollution Control Research Series, DAST-13, Oct, 1969. 137 p, 98 fig, 3 ref. FWPCA Program No 11024 DGZ.
Identifiers: *Combined sewers, Low cost, Low maintenance, *Fluidic, Regulator, *Variable diversion, No-moving-parts.

The objective of this program was to demonstrate feasibility, and to develop a workable configuration for a combined sewer Fluidic regulator, whose purpose is to minimize combined sewer discharge while protecting interceptor sewers from overloading during storm flows. A second objective was to develop design procedures and criteria for the general application of this concept to municipal sewer diversion requirements, including preliminary investigations of construction methods, costs, and maintenance requirements. A third objective was to establish a plan and location for an operational demonstration of the concept with a cooperating municipality. All objectives were successfully met. A generic Fluidic Regulator configuration was evolved which diverts 0 to 75% of the combined sewer flow away from the interceptor as a function of water level sensed in the interceptor sewer, or combined sewer, in either an analog or digital operational mode. Application design criteria were evolved for a range of small to medium sized municipal sewers, in terms of a few basic parameters. Projected installation costs are only slightly more than for conventional diversion structures; while the anticipated construction and maintenance requirements are simple and minimal. The City of Philadelphia was established as the demonstration site, and a demonstration unit should become operational in late 1970. Recommendations were made for experimental activity to improve regulation linearity; expand application size limit, and to better definitize construction methods and costs.

WHARVES, DOCKS, AND FERRIES.
Pa Stat Ann tit 53, sec 14212-14217 (1957).

Descriptors: *Pennsylvania, *Bulkhead line, *Coastal structures, *Condemnation, Docks, Piers, Bulkheads, Local governments, Administrative agencies, Administrative decisions, Condemnation value, Cost repayment, Riparian rights, Compensation, Permits, Low water mark, Navigable rivers, Construction, Legislation.

Cities of the first class may purchase and hold all properties and improvements extending into the navigable streams in front of said cities and may remove, alter, or modify the location, dimensions, or character of same to further the commercial interests of said cities. Such action, however, shall be taken only pursuant to recommendations of the Board of Harbor Commissioners and duly enacted city ordinances. Prior to any such recommendation, the Board shall give due notice to the owners of the properties to be affected. Should the owners fail to commence the removal or reconstruction, said cities may condemn said properties and improvements upon compensating the owners. When an owner also owns the adjacent bulkhead or riparian rights, the condemnation shall only encompass the primary properties. The councils in said cities may revise and establish the line beyond which no wharf or pier may extend and establish the arbitrary low water line or bulkhead line. No license shall be granted under which a new wharf is to be built, or old wharf extended, unless afterwards there shall be a water surface between it and adjoining wharves of at least one hundred and fifty feet. (Schram-Florida)

The Department of Forests and Waters may dredge and remove flood waste, deposits, flood water obstructions and debris from any stream and may restore flood damaged stream channels in all streams except the tidal waters of the Delaware River. The Department may construct and maintain dams, lakes, and other improvements to impound flood waters, provide recreational areas, and construct flood forecasting and warning stations.

The Department may lease or purchase equipment and materials for these projects with the approval of the Governor. The Department may further acquire all property or easements necessary for carrying out this act. The Department is authorized to use condemnation proceedings for the acquisition of property. The Department is authorized, with the Governor's approval, to enter into agreements with the federal government, state agencies, or local subdivisions, municipalities, and private persons and corporations. Work assigned by the Department must be let to the lowest bidder. (Kelly-Florida)

DAMS AND STORAGE RESERVOIR.
Pa Stat Ann tit 32, secs 815.46-815.49a5 (1967).

Descriptors: *Pennsylvania, *Dams, *Water conservation, *Delaware River, Dam construction, Costs, Financing, Water resources development, Interstate rivers, Administration, Interstate, Operation and maintenance, Management, Impoundments, Impounded waters, Water supply, Flow augmentation, Legal aspects, Interstate compacts, New Jersey, Reservoirs, Reservoir construction, Condemnation.

The state legislature hereby accepts a portion of the New Jersey law relating to the construction of dams and reservoirs and the payment of land damages, costs, and expenses on land acquired in New Jersey for purposes of a prior act. An interstate compact is hereby entered into for the construction of a dam across a certain section of the Delaware River between New Jersey and Pennsylvania. A reservoir shall be maintained above said dam for the purpose of impounding the waters of the Delaware to provide a supply of water for domestic, commercial, and industrial purposes. Such construction and maintenance shall be deemed to be a public project for benefits of both states. Land may be taken for construction of the dam or reservoir through condemnation proceedings. Detailed procedure for condemning and/or purchasing land is provided. Certain provisions of the Delaware River Compact are revoked insofar as they prohibit construction of dams and reservoirs across the Delaware River. New Jersey and Pennsylvania mus concur on the location, size, and construction of any dam or reservoirs. (Kelly-Florida)
W70-02829

CONSERVATION AND CONTROL OF AQUATIC PLANTS AND FISH.
Wis Stat Ann secs 29.545, 29.571, 29.62, 29.623, 29.625, 29.626, 29.63 (1964), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Aquatic plants, *Fish control agents, *Regulation, Wild rice, Sago pondweed, Aquatic weed control, Administrative agencies, Harvesting, Fish hatcheries, Dam construction, Damsites, Flood control, Drainage effects, Water levels, Rough fish, Carp, Buffalo fishes, Suckers, Sport fish, Riparian land, Fish stocking, Gill nets, Trout, Permits.
Identifiers: *Wildlife refuge, *Trammel net, *Sturgeon, *Game preserve.

The removal of any aquatic plants from specified water bodies without authorization by the State Conservation Commission is prohibited. Written authorization may be given where the plants endanger public health, are not needed for propagation of fish or wildlife, or unreasonably impair property or esthetic values. A wildlife refuge is established on the Horicon Marsh. The refuge may include a fish hatchery which is to be supervised by the Commission. The Commission is authorized to construct and maintain dams to control the flood waters of Rock River and to restore the natural water levels of Horicon Marsh prior to its drainage. The Commission may remove all 'rough fish' from inland waters. It may also remove or permit the removal of any species of fish which it determines to be detrimental to any state waters or to game fish in certain designated areas. Penalties are provided for persons who use nets to catch fish in inland waters, who fish without licenses, or who otherwise violate any provision of the statutes or any Commission order related to fishing. Double damages may be awarded against trespassers on lands bordering streams stocked from state fish hatcheries. (Dearing-Florida)
W70-02838

POWERS OF THE DEPARTMENT OF RESOURCE DEVELOPMENT.

Wis Stat Ann secs 31.01, 31.02 (1964), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Water levels, *Dams, *Drainage programs, Administrative agencies, Permits, Navigable waters, Bench marks, Gaging stations, Low flow, Water measurement, Dam construction, Locks, Fish passages, Fish stocking, Chutes, Floodgates, Spillways, Hoisting machinery, Piers, Drainage districts, Ditches, Water conservation, Irrigation programs, Water birds.
Identifiers: *Pisciculture, *Marine railway, *Dykes.

The Department of Resource Development is empowered to regulate the level and flow of all navigable waters and may erect bench marks to designate the maximum and minimum levels that may be maintained by any dam. It shall establish gaging stations upon navigable waters to determine their characteristics. The Department shall investigate and supervise the construction, operation, and maintenance of all dams in navigable waters. The Department shall have free access to any dam and may enter any property to investigate a waterway or the use of water from any lake or stream. The Department may require any dam to be furnished with log slides and chutes, locks, boat hoists, or other special equipment set forth in the statute. The Conservation Commission shall operate and maintain dams and dikes across drainage ditches and streams in drainage districts. (Dearing-Florida)

RATE AND DIRECTION OF GROUNDWATER CIRCULATION IN CLOSE SPACED BEDROCK AND GRAVEL WELLS UNDER NON-SYNCHRONOUS PUMPING TIME AND RATES,
Connecticut Univ., Storrs. Inst. of Water Resources.
L. Frankel.
Research Project Technical Completion Report, 1969. 4 p. OWRR Project A-005 (CONN).

Descriptors: Glaciolacustrine, *Sedimentation, Sorting, *Grain size, Glaciofluvial.
Identifiers: Hydrology, Groundwater, *Water supply, Contamination, *Water yield.

Two low yield well fields were developed in the complexly bedded glaciolacustrine and glaciofluvial materials of the Skungamaug River Valley. Textural analyses, measurement of flow patterns in close spaced wells and observations of well reactions to various tests suggest that the individual beds and lenses of sediment vary so greatly in their hydrologic characteristics that they constitute not a single aquifer but a complex of intermingled aquifers of limited horizontal and vertical extent. As a result of this complex, varying and presently unpredictable degrees of interaction exists among these sedimentary units within the system. The complex cannot be evaluated as a single, uniform system. In addition, it appears from the test performed, that the total grain size distribution characteristics of each sedimentary unit have a greater relationship to the hydrology of the unit than average grain size values of these units.

URBAN RUNOFF BY ROAD RESEARCH LABORATORY METHOD,
Illinois State Water Survey, Urbana.
Michael L. Terstriep, and John B. Stall
ASCE Proc, J Hydraul Div, Vol 95, No HY6, Pap 6878, p 1809-1834, Nov 1969. 26 p, 19 fig, 6 tab, 19 ref, append.

Descriptors: Storm runoff, *Urbanization, Mathematical models, Rainfall-runoff relationships, Roads, Model studies, Storm drains, Hydraulics, Hydrology, Open channel flow, Sewers, Streamflow, Planning
Identifiers: Urban hydrology, Urban planning.

A simple mathematical model of an urban basin presented in 1962 by the British Road Research Laboratory is tested on three urban watersheds in the United States. The basins are located in Baltimore, Md. and Chicago, and Champaign, Ill. They contain 0.395, 12.5, and 2290 acres respectively. The model produces a runoff hydrograph by applying rainfall to only the directly connected impervious area of the basin. The basin is described by a time-area diagram and a discharge-storage relationship. The peak discharges of actual and predicted hydrographs are compared for 39 storms and complete hydrographs are shown for 8 of these. To apply the model to a basin, the pattern of impervious areas must be known in detail, as well as the slopes and sizes of all surface and subsurface drains. (Knapp-USGS)

BAER V BD OF COUNTY COMM'RS OF WASHINGTON COUNTY.

257 A2d 201-205 (Ct App Md 1969).

Descriptors: *Maryland, *Alteration of flow, *Riddance (Legal aspects), *Relative rights, Pipes, Drains, Drainage, Surface waters, Subsurface waters, Water control, Drainage water, Legal aspects, Judicial decisions, Surface runoff, Drainage systems, Drainage effects, Running waters, Groundwater, Groundwater movement, Repulsion (Legal aspects), Land tenure, Absorption, Diversion, Inhibition, Rainwater.
Identifiers: Injunction (Prohibitory).

Washington County, through the use of pipes, channeled water from higher adjacent lots to a point near the lot of a lower owner. As a result the lower owner was deprived of the natural processes of absorption and diversion. Substantial quantities of water accumulated on the lower owner's lot after heavy rains, and the lower owner sought injunctive relief. The lower court dismissed the owner's complaint. On appeal, the Court of Appeals of Maryland remanded the case, holding that while a servient estate is required to accept water from higher adjacent lots, the upper proprietor must act reasonably. (Marsee-Florida)

SOME ASPECTS OF THE EFFECTS OF THE QUANTITY AND QUALITY OF WATER ON BIOLOGICAL COMMUNITIES IN EVERGLADES NATIONAL PARK,
Geological Survey, Miami, Fla. Water Resources Div.
Milton C. Kolipinski, and Aaron L. Higer.
Geological Survey Open file Report, Sept 1969. 97 p, 21 fig, 8 tab, 25 ref.

Descriptors: *Water quality, *Water levels, *Streamflow, *Florida, *Wetlands, Swamps, Surface waters, Ecology, Droughts, Water pollution sources, Dissolved oxygen, Sampling, Drought resistance, Hydrology, Low flow.
Identifiers: *Everglades, *Shark River.

Hydrobiological investigations were made in Everglades National Park and are summarized under four main topics: (1) vegetative changes, (2) population dynamics of animals, (3) repopulation of small aquatic animals after droughts, and (4) water-quality characteristics. Changes of vegetation in Shark River Slough from 1940 to 1964 showed a decrease in acreage of wet prairie communities and an increase in sawgrass marshes and woody vegetation. The apparent reasons for the changes are shortened wet periods, increase in fires, and loss of soil. Long wet periods result in an abundance of small aquatic animals and the successful formation of wading bird rookeries. (Knapp-USGS)

REFORESTATION SURVEY.

Pa Stat Ann tit 32, secs 673-677 (1967).

Descriptors: *Pennsylvania, Surveys, *Investigations, *Flood control, Administrative agencies, Natural resources, Data collections, On-site investigation, Land resources, Conservation, Land use, Water resources, Water resources development, Legal aspects, Legislation, Reforestation, Forest management, Land development, Land management.

The Department of Forests and Waters is authorized to make an investigation and reforestation survey, with flood control as the objective, of the three watersheds of the Commonwealth. The investigation and survey are to be made of all private lands and all abandoned farm lands and submarginal lands. The Department shall make a complete report of its reforestation survey to the General Assembly, so that the General Assembly may be advised regarding adoption of a comprehensive flood control program. Whenever any grant or right in the bed of any navigable waters in the Commonwealth becomes inimical to the public interest, it shall be voided. The Department is empowered to determine when any such right, grant or privilege has become derogatory or inimical to the public interest. A full hearing with due notice is required before such finding may be made. Appeals may be made by aggrieved parties to the Superior Court. (Kelly-Florida)

RANGE SEEDING PROBLEMS AND RESEARCH IN THE PINYON-JUNIPER WOODLAND TYPE OF SOUTHWESTERN UNITED STATES,
Agricultural Research Service, Washington, D.C. Crop Research Div.
F. B. Gomm, and Fred Lavin.
Annals of Arid Zone, Vol 7, No 2, p 209-220, 1968. 1 fig, 35 ref.

Descriptors: *Southwest U.S., *Pinyon pine trees, *Juniper trees, *Range management, *Semiarid climates, Brush control, Grazing, Droughts, Land use, Grasses, Rehabilitation, Planting management, Natural resources, Vegetation, Carrying capacity, Economics, Costs, Ecology, Decision making, Rainfall, Seeds, Forests, Forages, Range grasses, Revegetation.
Identifiers: *Reseeding.

Pinyon-juniper woodland is used primarily for spring and fall grazing. Use of juniper wood for fuel and fence posts has declined to the point that juniper is now considered a weed species. These lands have been traditionally over grazed, and now have an average stocking rate of 7 acres per animal-unit-month (AUM). In areas where range improvement is economically justified, it is often necessary to kill trees before planting forage grasses. Pinyon-juniper woodlands cover about 60 million acres in the Southwest. The climate is semiarid and subject to frequent droughts. Potential economic returns from livestock must be weighed against costs of controlling pinyon and juniper and reseeding before a decision can be made regarding a particular area. A thorough study of the ecological conditions is recommended as a preliminary step necessary to decision making and choice of species to be reseeded. A list of potentially useful forage species is given. (Crouse-Arizona)

EROSION PREVENTION EXPERIMENTS,
Connecticut Univ., Storrs.
Chesley J. Posey.
Proc 13th Congr Intn'l Assoc for Hydr Res, Vol 2, p 211-219, 1969. OWRR Project A-009-CONN.

Descriptors: *Erosion control, Stream stabilization, Groundwater replenishment.
Identifiers: *Riprap, *Reverse filters, Rock sausages, Gabions.

Test of erosion protection in model channels, in an apparatus designed to permit comparisons under severe erosion exposure, and in field installations show that successive layers, each meeting the specifications for reverse filters will give complete protection to the finest, most erodible soils. Accurate prediction of the sizes necessary for the topmost layer, to prevent it from being washed away, cannot be made, and this must be determined by trial. If large enough stones are not available, smaller stones may be bound with mesh tubing, giving greatly increased resistance to erosion. Observations of field installations are being continued under auspices of the Connecticut Department of Transportation. A 16 mm silent color motion picture film summarizes the results obtained so far in form suitable for showing to engineering designers and maintenance men.

STATE V ARCHER.

107 NJ Super 77, 257 A2d 1-2 (1969).

Descriptors: *New Jersey, *Eminent domain, *Erosion control, *Condemnation, Judicial decisions, Hurricanes, Beach erosion, Beaches, Streams, Erosion, Coastal engineering, Shore protection, Soil erosion, Tidal effects, Waves (Water), Public lands, Legislation, Legal aspects, Projects, Federal government, State governments, Water law.

A New Jersey statute authorized the Department of Conservation and Economic Development to condemn lands for improvement or development of waterways, streams, rivers, creeks, or waterfront or oceanfront property. The Department took lands in the Borough of Union Beach for purposes of hurricane and shore protection in conjunction with a federal project for beach erosion control and hurricane protection. The Superior Court of New Jersey, Appellate Division, held that the taking was authorized by the statute, and that such taking was for public purpose, though the program necessarily affected only particular areas. RESPIRATION CORRECTIONS FOR BACTERIAL UPTAKE OF DISSOLVED ORGANIC COMPOUNDS IN NATURAL WATERS,
North Carolina State Univ., Raleigh. Dept. of Zoology.
John E. Hobbie, and Claude C. Crawford.
Limnology and Oceanography, Vol 14, No 4, p 528-532, July 1969. 5 p, 2 fig, 2 tab, 8 ref. OWRR Project A-015-NC, and NSF Grant GB-5678.

Descriptors: *Respiration, *Bacteria, *Radiochemical analysis, *Organic compounds, Microorganisms, Carbon dioxide, Ponds, Sampling, Analytical techniques, Plankton, Carbon radioisotopes, Tracers, Tracking techniques.
Identifiers: Carbon-14 analysis.

The uptake of C-14 labeled organic compounds has been used by many workers to study heterotrophic microorganisms in natural waters. However, if flux rates of organic compounds are to be measured, the loss of carbon dioxide during incubation becomes an important source of error. A method is proposed in which the experiment is run in a closed system and the carbon dioxide collected after killing and acidification. Phenethylamine on chromatographic paper is the absorbing agent and the paper is counted by liquid scintillation. Studies of 19 compounds from pond water showed that 60% (aspartic acid) to 8% (arginine) of the labeled material entering the microorganisms was respired. (Gabriel-USGS)

ANALYSIS OF TRACE ELEMENTS IN WATER,
Rhode Island Univ., Kingston. Water Resources Center.
Vincent C. Rose.
Technical Completion Report 1969. 8 p. OWRR Project A-019-RI.

Descriptors: *Pollution, *Trace metals, *Ion exchange, *X-ray fluorescence.
Identifiers: *Nuclear fuel.

The purpose of this research was to develop ion exchange techniques for rapidly concentrating certain trace metals from water and to develop methods of analyzing the samples on ion exchange media. The study was limited to uranium, zirconium, tin, nickel, chromium and iron. Cation exchanger load filter papers were used to concentrate the solutions using a flow rate of 23 ml/sq cm/min. The fluid was recycled through the paper six times. The papers were analyzed by x-ray fluorescence analysis. As little as 25 micrograms of metal gave a statistically valid signal. A linear relation between normalized count rate and the amount of metal was found. The lower analytical detection limit was 0.125 milligram or all elements and the upper limit (98% recovery) ranged from 0.6 milligrams for chromium to 1.25 milligrams for uranium.
W70-02768

BIOASSAY OF WATER POLLUTANTS WITH CULTURED MAMMALIAN CELLS,
Rhode Island Univ., Kingston. Dept. of Biophysics.
Harold W. Fisher.
Technical Completion Report, Rhode Island Water Resources Center, 1969. 13 p, 1 tab, 11 fig. OWRR Project A-027-RI.

Descriptors: *Bioassay, *Pollutants, *Mammalian cells.

Plating efficiency tests of the growth of discrete macroscopic colonies from single cells of cultures of human and bovine cells were used to titrate the toxicity of various inorganic pollutants, herbicides and pesticides. Significant differences were found for the titration end-points of the test substances and a high degree of sensitivity to some of them was revealed. One of the most toxic pesticides, Rotenone (C23H22O6) was analyzed by exposing single attached cells in the petri dish to selected concentrations of the pesticide for different lengths of time, then removing the pesticide and growing the surviving cells in fresh complete growth medium. A plot of the log of the surviving fraction as a function of exposure time gave a straight line at each concentration tested. The slopes of these lines as a function of the respective concentration of pesticide also gave a straight line passing through the origin. This suggests that perhaps there is no threshold for the toxicity of some water pollutants.

PROCEEDINGS OF THE EUTROPHICATION-BIOSTIMULATION ASSESSMENT WORKSHOP.
California Univ., Berkeley. Sanitary Engineering Research Lab and Pacific Northwest Water Lab, Corvallis, Oreg.

Proceedings of the Eutrophication-Biostimulation Assessment Workshop, June 19-21, 1969, California Univ, Berkeley, Sanitary Engineering Research Lab and National Eutrophication Research Program, Corvallis, Oregon, Pacific Northwest Water Lab p i-iv + 281 p, 93 fig, 43 tab, 341 ref.

Descriptors: Eutrophication, *Conferences, Water pollution effects, Algal control, Water pollution, Toxicity, Lakes, Design criteria, Remote sensing, Minnesota, Sediment-water interfaces, California, Bioassay, Scenedesmus, Physiological ecology, Kinetics, Farm wastes, Benthos, Nitrates, Fluorescence, Nitrogen fixation, Environmental effects, Nutrient requirements, Communities (Biological), Carbon radioisotopes, Productivity, Rivers, Trace elements.
Identifiers: *Biostimulation, Algal growth, Water pollution assessment, Sanitary Engineering Research Laboratory (Calif), National Eutrophication Research Program, Continuous culture, Chemostats, Batch cultures, Acetylene reduction technique, Heterotrophy, Flagellates, Lake classification, Shagawa Lake (Minn).

Eutrophication may be the most serious and pressing water quality problem we face, and new scrutiny of research approaches is required. The deliberations are presented of a group of workers in eutrophication held at Berkeley, California, during 19-21 June 1969. The sessions were sponsored by the Sanitary Engineering Research Laboratory, University of California, and the National Eutrophication Research Program, US Department of the Interior. Scope of the report is indicated by subjects of individual contributions: need for assays, chemostat assays, batch assays for determining algal growth potential; algal growth assessment by fluorescence techniques; kinetic assessment of algal growth, factors in utilization by Scenedesmus of nitrate from agricultural wastes; environmental and nutritional requirements for algae; assessment of nitrogen fixation by acetylene reduction, heterotrophy in algal flagellates, physiological ecology, physiological ecology of benthic algal communities; measurement of algal growth with radiocarbon; lacustrine classification; productivity of rivers; measurement of trace elements in the hydrosphere; design applications of biostimulation

and toxicity criteria; remote sensing in water resources management; nutrient exchange between sediment and water; and Shagawa Lake (Minnesota) eutrophication research project. An index is provided. See also W70-02776 thru W70-02779). (Eichhorn-Wisconsin)
W70-02775

NEED FOR ASSAYS,
California Univ., Berkeley. Sanitary Engineering Research Lab; and Pacific Northwest Water Lab. Corvallis, Oreg.
Gerard A. Rohlich.
Proceedings of the Eutrophication-Biostimulation Assessment Workshop, June 19-21, 1969, California Univ, Berkeley, Sanitary Engineering Research Lab and National Eutrophication Research Program, Corvallis, Oregon, Pac Northwest Water Lab, p 1-6. 1 fig, 6 ref.

Descriptors: *Bioassays, *Eutrophication, Nutrients, Water pollution sources, Limnology, Comparative productivity, Environmental effects, Water pollution effects, Planning, Water quality, Analytical techniques.
Identifiers: Provisional Algal Assay Procedure, Joint Industry/Government Task Force on Eutrophication, Norway, Algal cultures, Algal growth, Water pollution assessment, Comparative studies, Water quality criteria, Standardization, Reproducibility, Research planning.

Because millions of dollars in public funds will, in the next few years, be expended to implement programs for the control of nutrients received by natural waters, scientists and engineers should work toward establishment of bioassays which will give comparable and reproducible results. Some experience in use of such assays has been gained in Norway. A standazrdized bioassay should serve to: (1) assess available algal nutrients in absence of toxicants; (2) estimate the effect on algal growth of added stimulants; and (3) determine acceptable levels for reduction of algal nutrients in any given body of water. The Provisional Algal Assay Procedure proposed by the Joint Industry/Government Task Force on Eutrophication is intended to meet those needs. (See W70-02775). (Eichhorn-Wisconsin)

ALGAL GROWTH ASSESSMENTS BY FLUORESCENCE TECHNIQUES,
Federal Water Pollution Control Administration, Alameda, Calif.
Richard C. Bain, Jr.
Proc of the Eutrophication-Biostimulation Assessment Workshop, June 19-21, 1969, California Univ, Berkeley, Sanitary Engineering Research Lab and Nat Eutrophication Research Program, Corvallis, Ore, Pac Northwest Water Lab, p 39-55. 9 fig, 20 ref, append.

Descriptors: *Algal growth, *Bioassays, *Fluorometry, California, Nutrients, Eutrophication, Chlorophyll, Fluorescence, Lakes, Rivers, Nitrogen, Biomass, Sewage, Farm wastes, Carbon cycle, Phosphorus, Phosphate, Nitrates, Industrial wastes, Water pollution effects, Denitrification, Spectrophotometry.
Identifiers: San Joaquin River (Calif), Merced River (Calif), Tuolumne River (Calif), Stanislaus River (Calif), Water pollution assessment, American River (Calif), Clear Lake (Calif), Eel River (Calif), Joint Industry/Government Task Force on Eutrophication, Provisional Algal Assay Procedure, Batch cultures, Chemostats, Chlorophyll a, Photobiology, Algal growth potential, San Francisco Bay.

Author describes procedures for assessing algal growth potential, in Joint Industry/Government Task Force's Provisional Algal Assay Procedure, by estimating algal chlorophyll fluorometrically or spectrophotometrically. Water smaples are filtered through glass fiber filters, preserved with magnesium carbonate, and filters kept frozen in dark refrigerator. Chlorophyll concentration, extracted into solution by grinding the filter in acetone, is estimated by spectrophotometry (at wavelengths 630, 645 and 665 nanometers) or fluorometry. Correction for phaeophytin is accomplished by a second reading after treatment of sample with hydrochloric acid. Illustrative data for various California waters receiving sewage, agricultural, and industrial wastes are delineated in the report. In batch assays, peak fluorescence due to chlorophyll, characteristically appears within the first week, not necessarily paralleling peak biomasses. Data analysis from such assays together with those for nutrient analysis permits interpretive applications of the procedure. Thus, for 44 data points from various streams in San Joaquin Valley, in which nitrogen is thought to be limiting, regression analysis of relationship between total N (milligrams/liter) and chlorophyll (micrograms/liter) yields ratio, total N/chlorophyll, with 95% confidence interval of 4.6-10.8, in good agreement with literature values for algal cells with nitrogen limiting. (See W70-02775). (Eichhorn-Wisconsin)

Proc of the Eutrophication-Biostimulation Assessment Workshop, June 19-21, 1969, California Univ, Berkeley, Sanitary Engineering Research Lab and Nat Eutrophication Research Program, Corvallis, Ore, Pac Northwest Water Lab, p 23-38. 8 fig, 13 ref.

Descriptors: *Cultures, *Algae, Eutrophication, Water pollution effects, Iron, Chlorella, Bioassays, Bioindicators, Activated sludge, Nutrients, Phosphorus, Nitrogen, Gravimetry, Spectrophotometry, Carbon radioisotopes, Centrifugation, Fluorometry, Volumetric analysis, Chlamydomonas, Toxicity, Euglena, Waste treatment.
Identifiers: *Batch assays, *Algal growth potential, Water pollution assessment, Pacific Northwest Laboratory, Provisional Algal Assay Procedure, Bottle tests, Phacus, Limiting factors, Synergism, Temperature effects, Selenastrum capricornutum, Photobiology, Anabaena flos-aquae, Microcystis aeruginosa, Scenedesmus obliquus, Pleomorphism, Cell size, Error analysis, Cell enumeration.

Successful use of algal cultures in studies of algal growth potentials, trace mineral analyses, tastes and odors, and toxicity, gives reason to believe they may be valuable for assessment of eutrophication potential in the 'bottle test' version of the Provisional Algal Assay Procedure (PAAP), as proposed by the National Eutrophication Research Program. While tests may lack elegance, they are simple, flexible, versatile, reliable, and applicable--criteria established as desirable for that program. Author feels that certain characteristics of the test, as presently recommended, require alteration. It is doubtful, for example, if requirements for vigorous shaking, rigid temperature control, and accessory gases are necessary. In addition, simplified incubation techniques and apparatus should be evaluated. Several of the techniques proposed for assessment of growth in cultures may be unnecessarily complex or expensive, whereas techniques of fluorescence analysis and volumetric analysis of growth--not now being considered--should be studied. Parameters of growth in PAAP could be evaluated in terms of growth levels for which they may be most useful; thus, a rational system might involve enumeration of cells for algal growth potentials (in milligrams/liter) of 0.1-10; fluorescence, for 10-100; and gravimetry, for 100-1000. (See W70-02775). (Eichhorn-Wisconsin)

CONTINUOUS-FLOW (CHEMOSTAT) ASSAYS,
California Univ., Berkeley. Sanitary Engineering Research Lab
Donald B. Porcella.
Proceedings of the Eutrophication-Biostimulation Assessment Workshop, June 19-21, 1969, California Univ, Berkeley, Sanitary Engineering Research Lab and National Eutrophication Research Program, Corvallis, Ore, Pacific Northwest Water Lab, p 7-22. 6 fig, 1 tab, 30 ref.

Descriptors: *Bioassays, Nutrients, Phosphorus, Kinetic theory, Environmental factors, Biomass, Growth rates, Algae, Oligotrophy, Limiting factors, Chlorella, Analytical techniques, Cyanophyta, Diatoms, Eutrophication, Water pollution effects, Systems analysis, Succession, Ecosystems, Cycling nutrients.
Identifiers: *Continuous culture, *Chemostats, Turbidostats, Nutrient limited growth, Luxury consumption, Provisional Algal Assay, Procedures, Selenastrum capricornutum, Selenastrum gracile, Growth limitation, Selenastrum, Algal growth, Anabaena, Biostimulation, Water pollution assessment.

Because their dynamic properties more nearly approximate ecological conditions than do batch cultures, continuous cultures operating in chemostat mode (constant flow-rate) have been utilized in a variety of studies of algal growth, including assessment of biostimulatory responses. Requirements for steady state continuous flow systems and characteristics of ideal chemostats with illustrations of idealized curves from an experiment concerning relative change in algal cell material and limiting phosphorus concentrations are included. In transient phases of chemostat operation, phosphorus concentrations are less than those calculated theoretically, probably due to 'luxury consumption' by algae. Considerations of mass balances and kinetics of algal growth, useful in derivation of continuous cultures theory, need be applied to natural ecosystems to elicit useful information on productivity, nutrient cycling, and successional relationships. Based on chemostat experiments described, utilizing both Selenastrum gracile and natural algal populations as 'seed', are areas requiring further study, including the following problems: multiple limiting factors; use of natural 'seed' populations, excessive washout and extinction of cultures in bioassay of oligotrophic waters, development of synthetic media; and profiles of biomass analysis and nutrient concentration during transient growth in order to establish appropriate kinetic parameters. (See W70-02775). (Eichhorn-Wisconsin)

MEMBRANE FILTER-FLUORESCENT-ANTIBODY METHOD FOR DETECTION AND ENUMERATION OF BACTERIA IN WATER,
North Texas State Univ., Denton. Dept. of Biology.
Rufus K. Guthrie, and Dennis J. Reeder.
Applied Microbiology, Vol 17, No 3, p 399-401, Mar 1969. 1 fig, 1 tab, 8 ref.

Descriptors: *Bacteria, *Coliforms, *Fluorescence, *Technical feasibility, Water pollution sources, Water pollution.
Identifiers: *Technique, Membrane filter methods, Fecal pollution, Escherichia coli, Fluorescent-antibody techniques.

The best currently available standard method for enumerating coliform bacteria (indicators of fecal pollution, and thus potentially endangering waters) requires from 18-24 hours for completion. An application of the fluorescent antibody technique to coliform detection and counting requires only 5-12 hours for completion. In this new application, the sample of water being tested was pulled through a black, gridded membrane filter, and incubated on Trypticase Soy Agar. After incubation at 35 C the membrane was placed back on the filter apparatus, overlayed with normal rabbit serum, and allowed 5 minutes contact. This was then pulled through by negative pressure. Next, the colonies were overlayered with specific or pooled labeled antiserum, given 15-20 minutes contact, then pulled through. After washing with buffered saline and glycerol solution, colonies were counted with a ten-power

dissecting microscope rigged for fluorescence observation. Coliform counts using the new technique compared favorably with standard MPN and m-Endu and m-FC techniques. (Gerhold-Wisconsin)

INTERPRETATION OF RADIONUCLIDE UPTAKE FROM AQUATIC ENVIRONMENTS,
Oak Ridge National Lab., Tenn. Radiation Ecology Section.
Daniel J. Nelson.
Nuclear Safety, Vol 5, No 2, p 196-199, 1964. 12 ref.

Descriptors: *Radioisotopes, *Aquatic environment, Chlorella, Tracers, Photosynthesis, Carbon radioisotopes, Fish, Clams, Strontium radioisotopes, Tennessee River, Trophic level, Algae, Caddisflies, Food chains, Stable isotopes, Radioactive waste disposal, Oceans, Foods, Absorption, Hazards, Cesium, Hydrogen, Deuterium, Tritium.
Identifiers: *Uptake, Specific activity, Chlorella pyrenoidosa, Biological half-life, Clinch River (Tennessee), Physical half-life, Hydropsyche cockerelli, Body burdens, Pomoxis annularis, Gastrointestinal tract.

Specific activities in aquatic organisms help explain differences in radionuclide uptake. Data evolved by routine radiological monitoring establishes safety standards for radionuclide releases to freshwater habitats. Equilibrium levels of radionuclides between organisms and environment are expected only for elements with short biological half-life in tissue. Method of specific activities is based on assumption that if the distribution of a stable element is known between an organism and its environment, it may be used to predict radionuclide concentrations in water organisms receiving constant radionuclide releases. The relation of strontium and strontium-90 in fish may be used to calculate expected body burdens. Specific activity relation might be a criterion for limiting radioactive waste disposal in oceans. While specific activity of a chemical element in environment of human food organisms is below the permissible specific activity for the element in a human body, man cannot obtain more than his permissible body burden from the seas. Direct application of the specific activity concept applies only to those radionuclides which constitute an absorption hazard. With radionuclides for which absorption is not critical, specific activities may be related to irradiation of the gastrointestinal tract by its contents. (Jones-Wisconsin)

SIMULTANEOUS DETERMINATION OF Zn-65-30 AND P-32-15 IN SHELLFISH BY RADIOCHEMCIAL TECHNIQUES,
Robert A. Taft Sanitary Engineering Center, Cincinnati, Ohio. Lab. of Physical and Engineering Sciences.
J. L. Setser, and T. C. Rozzell.
Talanta, Vol 12, p 903-911, 1965. 3 tab, 14 ref.

Descriptors: *Zinc radioisotopes, *Phosphorus radioisotopes, *Shellfish, *Radiochemical analysis, Clams, Oysters, Crabs, Anion exchange, Resins, Radioactivity, Precision tests, Chromium, Iron, Cobalt radioisotopes, Potassium radioisotopes, Strontium radioisotopes, Cesium, Manganese, Arsenic radioisotopes, Sodium, Oregon, Water pollution effects, Water pollution sources, Radioecology.
Identifiers: *Water pollution identification, Matrix methods, Sensitivity, Mercury radioisotopes, Ruthenium radioisotopes, Zirconium radioisotopes, Niobium radioisotopes, Yttrium radioisotopes, Tillamook Bay (Oregon), Spectrum stripping methods, Half-life.

Zn-65 (radiozinc) and P-32 (radiophosphorus) are created by neutron activation in single-pass water-cooled reactors. The usual procedure in such reactors involves circulation of river water, after removal of suspended materials by water treatment as coolant, around and through the reactor, and after several hours, returning the heated water to the river. A radiochemical procedure for rapid determination of Zn-65 in shellfish is described. Because of interest in both Zn-65 and P-32, the procedure was combined with a classical phosphorus procedure and made compatible for simultaneous determination of the two nuclides. The method described is far less expensive than matrix or spectrum stripping procedures of determination, and has been applied to pure samples consisting only of Zn-65 and P-32, and to unknown samples consisting of a complex organic matrix. Tests for sensitivity, precision, and accuracy indicate the technique has direct application to determination of the two nuclides in shellfish analyzed over a period of eight months. Radiochemical values agreed reasonable well with data from two separate matrix methods and with data for both nuclides reported by other investigators. (Jones-Wisconsin)

SEDIMENTARY PHOSPHORUS IN LAKE CORES--ANALYTICAL PROCEDURE,
Wisconsin Univ., Madison. Water Chemistry Lab.
Dennis A. Wentz, and G. Fred Lee.
Environmental Science and Technology, Vol 3, No 8, p 750-754, Aug 1969. 3 fig, 4 tab, 24 ref.

Descriptors: *Phosphorus, *Sediments, *Lakes, *Cores, *Chemical analysis, Nutrients, Eutrophication, Soil chemistry, Water chemistry, Sorption, Water pollution sources, Spectrophotometry, Hydrogen ion concentration, Phosphorus compounds, Iron.
Identifiers: *Water pollution identification, Water pollution assessment, Beer's law, Extraction procedures, Sample size, Orthophosphates, Phosphorus (Available), Fluoroapatite, Error analysis, Precision, Calcium phytate, Sample pretreatment, Adenosine monophosphate, Iron interference, Ferric phosphate, Sensitivity.

Available P (phosphorus) is an operationally defined fraction of soil influencing plant growth response. Procedures are described for extracting available P from sediments utilizing dilute mixture of hydrochloric and sulfuric acids. Size and pretreatment of sample, and pH of sediment-extractant mixture significantly affect amounts of P extracted. At pH employed, all sorbed orthophosphates should leach from sediments. Of fluoroapatite and calcium phytate added to samples, 88 and 11% respectively were recovered; adenosine monophosphate and ferric phosphate were not recoverable. Iron (22.3 milligrams iron/gram dry sediment) did not interfere. Relatively constant but significant errors result from turbidity and color leaching from sediment. Conversion to vanadomolybdophosporic derivative yields yellow solution which is estimated spectrophotometrically at wavelength, 420 nanometers, which minimizes effects of iron, guarantees optimal sensitivity, and insures adherence to Beer's law. Five samples each at three concentrations (10.0, 2.00, and 1.00 milligrams P/liter), and three optical path lengths (1, 5, and 10 centimeters), yield following ranges of sensitivity (S--milligrams P/liter per 1% transmittance), precision (C--standard deviation of replicately measured concentrations), and working range (W--milligrams P/liter): S, 0.015-0.15; M, 0.02-0.2; C, 0.002-0.02; and W, 0.2-18. The technique has application in studies of accelerated eutrophication. (Eichhorn-Wisconsin)

5B. Sources of Pollution

LEAD AND OTHER METAL IONS IN UNITED STATES PRECIPITATION,
National Center for Atmospheric Research, Boulder, Colo. Atmospheric Science Lab.
Allan L. Lazrus, Elizabeth Lorange, and James P. Lodge, Jr.
Environ Sci and Technol, Vol 4, No 1, p 55-58, Jan 1970. 4 p, 7 fig, 1 tab, 14 ref.

Descriptors: *Water pollution sources, *Air pollution, *Metals, *Precipitation (Atmospheric), *Trace elements, Smog, Ions, Gasoline, Fuels, Pollutants, Industrial wastes, Water pollution.
Identifiers: Lead, Leaded gasoline.

The concentration of lead in the atmosphere is correlated with the amount of gasoline consumed in the U.S., and the concentration patterns for lead and four other metals -- zinc, copper, iron, and manganese -- are engendered primarily by human activity. Six months average values collected during 1966-67 from a network of 32 stations reveal that the northwest portion of the U.S. is conspicuously low in contamination; the northeast is relatively high, and the southwest and southeast vary from low to moderate, depending on the metal. EXTRACELLULAR PRODUCTS OF PHYTOPLANKTON PHOTOSYNTHESIS,
Westfield Coll., London (England). Dept of Botany; and University Coll., London. Dept. of Botany.
G. E. Fogg, Czeslawa Nalewajko, and W. D. Watt.
Proceedings Royal Society (B), Vol 162, p 517-534, 1965. 6 fig, 4 tab, 31 ref.

Descriptors: *Phytoplankton, Photosynthesis, Bicarbonates, Radioactivity, Carbon radioisotopes, Lakes, Organic matter, Sea water, Primary productivity, Light intensity, Trophic level, Sampling temperature, Tracers, Chlorella, Hydrogen ion concentration, Alkalinity, Diatoms, Temperature, Weather, Epilimnion, Algae, Density, Seasonal, Marine plants, Water pollution sources
Identifiers: *Extracellular products, Photic zone, Glycollic acid, Chemotrophy, Particulate matter, Blelham Tarn (England), Chlorella pyrenoidosa, Fixation, Tringford (England), Anabaena cylindrica, North Sea, Firth of Clyde (Scotland), Scotland, England, Lake Windermere (England), Carbon-14.

Following exposure in situ (3-24 hours) of lake or sea water samples, with added radioactive bicarbonate, radiocarbon was found in phytoplankters and in dissolved organic matter. Amounts in the water varied between 7 and 50% of total carbon fixed in photic zone of the water column. This production of labelled extracellular organic matter occurred under various conditions and with diverse phytoplankters. Estimation of primary productivity from fixation of carbon-14 in particulates only are probably erroneously low. Labelled organic substances in water are apparently liberated by intact photosynthesizing cells rather than from cells broken during filtration. Glycollic acid is possibly a principal substance. Over a wide range of light intensities, liberation of extracellular products by a given phytoplankton population was proportional to the carbon fixed in cells, tending to be relatively greater at low light intensities and at light intensities high enough to inhibit photosynthesis, when as much as 95% of total organic radiocarbon might be extracellular. Population density, period of exposure to labelled bicarbonate, and species differences influence such excretion. Extensive extracellular liberation, by phytoplankton, of photosynthetic products has important implications for studies of aquatic trophic relationships. (Jones-Wisconsin)

REPORT ON THE NUTRIENT SOURCES OF LAKE MENDOTA.
Wisconsin Univ., Madison.

Wisconsin Dep of Resource Development, Madison Water Resources Div, Report to the Lake Mendota Problems Committee, Jan 1966. 41 p, 4 fig, 12 tab, 58 ref.

Descriptors: *Lakes, *Fertilization, *Eutrophication, Sewage, Water chemistry, Precipitation (Atmospheric), Cities, Rural areas, Wetlands, Drainage water, Base flow, Nutrients, Nitrogen, Phosphorus, Seepage, Zoning, Diversion, Wisconsin, Water pollution sources.
Identifiers: *Lake Mendota (Wis), *Nutrient sources, Madison (Wis).

Existing information on the amounts and sources of plant nutrients entering Lake Mendota, Wisconsin, was reviewed and estimates of the current amount of plant nutrients entering the lake were made. Previous studies on the lake's ten tributaries indicated that about 7,100 pounds of soluble phosphorus entered the lake in 1946-1947, equivalent to 0.76 pounds/acre or 0.0075 milligrams/liter phosphorus, with about 200,000 pounds of nitrogen, mostly as nitrates. Streams from predominantly agricultural drainage generally showed low phosphorus and high nitrate nitrogen concentrations. Some tributaries were found to have abnormal concentrations due to contributions from manured land, sewage, and canning waste treatment plants. Estimates of current nutrient sources--to be treated with caution--indicated the following annual contribution from various sources: Municipal and industrial wastewater--nitrogen 47,000 lbs (8%), phosphorus 17,000 lbs (36%); urban runoff--nitrogen 30,300 lbs (5%), phosphorus 8,100 lbs (17%); precipitation on lake surface--nitrogen 97,000 lbs (17%), phosphorus 140 to 7,600 lbs (2%); rural runoff--nitrogen 52,000 lbs (9%), phosphorus 20,000 lbs (42%); ground water--nitrogen 250,000 lbs (45%), phosphorus 600 lbs (2%); nitrogen fixation--80,000 lbs (14%). A total of 556,300 lbs of nitrogen and 47,000 lbs phosphorus were estimated to be entering the lake, although no reliable estimates could be placed on marsh drainage. (Kuncy-Wisconsin)

THERMAL DISCHARGES FROM LARGE NUCLEAR PLANT,
Philadelphia Electric Co., Pa. Dept. of Engineering and Research; and Cornell Univ., Ithaca, N.Y. Dept of Zoology.
Stanley Moyer, and Edward C Raney.
ASCE Proceedings, Journal of the Sanitary Engineering Division, Vol 95, No SA6, Paper 6983, p 1131-1163, Dec 1969. 33 p, 13 fig, 11 tab, 20 ref

Descriptors: *Nuclear powerplants, *Cooling water, *Thermal pollution, *Mixing, *Water pollution control, Canals, Discharge (Water), Jets, Turbulence, Dispersion
Identifiers: *Thermal effluent mixing.

The cooling water requirements of the atomic powerplant on the Susquehanna River are 3350 cfs. Periods of low river flow, high natural river water temperatures, and high wet bulb temperatures are considered the most critical times for aquatic organisms. Hydraulic model tests resulted in the development of an efficient jet injection system which gives maximum mixing. A jet 5 fps to 8 fps at the end of a long canal introduces the effluent throughout the entire depth of the water column in the reservoir. This was superior to the use of a short discharge canal with a weir to release the warm water at the surface. At the critical seasons an increase of ambient water temperature of 13 deg F introduced as a jet was satisfactory in meeting the temperature requirements of the fishes and associated organisms. An open circulating system is to be used with cooling towers to reduce the effluent from 21 deg F to 13 deg F above ambient. Low approach velocities at the cooling water screen structures are recommended to safeguard fishes. (Knapp-USGS)

CONSIDERATIONS ON HYDRAULIC MODELS TO BE EMPLOYED TO STUDY RECIRCULATION INTAKE CONDITIONS OF COOLING WATER IN STEAM POWER STATIONS,
Universidad de la Republica, Monevideo (Uruguay). Dept. of Fluid Mechanics.
O. J. Maggiolo, and J. Spitalnik.
Journal of Hydraulic Research, Vol 5, No 3, p 189-207, 1967. 3 tab, 5 fig, 10 ref.

Descriptors: *Temperature, *Hydraulic similitude, *Hydraulic models, *Cooling, Path of pollutants, Heat budget, Energy budget, Thermal power plants, Recirculated water, Solar radiation, Heat transfer, Streams, Rivers, Estuaries.

This paper describes the use of models for studying the time necessary for hot water to circulate from the outlet of the condenser to the intake of the cooling water circuit of a thermal power station and temperature time changes of cooling water in the neighborhood of the pump-intake. This can be used in studying of peak load thermal power stations. In this paper the conditions to be fulfilled in the construction of a hydraulic model and the effect of the solar energy radiation are analyzed. The heat transferred to the water from the outside space is neither a function of the water temperature nor a function of the atmosphere temperature. This temperature changes from hour to hour, producing an accumulative effect of heat in the water, characteristic of a non-steady process. The temperature and relative humidity of the air change along the day and the power produced by the station is also variable. These conditions are considered in order to select the most convenient values for the scales of the model. The method is applied to the determination of a model with a horizontal scale of 1:250 and a vertical scale of 1:40 for two steam power stations existing in the Bay of Montevideo on the Rio de la Plata. (Novotny-Vanderbilt)

USE OF RIVER MODELS IN COOLING CIRCULATING WATER STUDIES,
Worcester Polytechnic Inst., Mass. Alden Hydraulic Lab.
L. J. Hooper, and C. N. Lawrence
Boston Society of Civil Engineers, Presented at Meeting held Feb 5, 1958, Hydraulics Section, p 356-365, 1958. 2 fig.

Descriptors: *Hydraulic models, *Cooling, Hydraulic similitude, Heat budget, Temperature, Reynolds number, Froude number, Streams, Heat balance, *Heat transfer, Convection, *Thermal pollution.

The use of hydraulic models for thermal pollution studies is discussed. Such models should satisfy Reynolds' and Froude modified densimetric criteria. Other criteria must be taken into account such as temperature and heat characteristics that sometimes require model construction on a 1/1 (prototype to model) basis. Experimental results show that the most important method of heat disposal has been the heat carried downstream by the river itself. The heat that can be transferred to the air has normally been found to be only a modest amount. Another possibility that should always be examined in a model study and the subsequence analysis of prototype performance is the possibility of heat storage in the pool. (Novotny-Vanderbilt)

COOLING WATER STUDIES AT ELECTRIC POWER STATION,
Duke Power Co., Charlotte, N.C.
Fred R. Gray, and Ben J. Stephenson
Journal of the Power Division, Proceed of ASCE, Vol 95, No PO2, Proc Paper 6853, p 293-303, Oct 1969. 1 tab, 12 fig.

Descriptors: *Hypolimnion, *Thermal power plants, *On site tests, *Thermal pollution, Lakes, North Carolina.

This study correlates field surveys and theoretical analyses of thermal discharges (heat dissipation patterns of power plant cooling water discharges). Duke Power's Marshall steam station was selected as one of the eleven sites for this study. The Marshall steam station is located on Lake Norman, which has a surface area of 32,500 acres and a volume of over 1,000,000 acre-ft. Weather conditions are relatively mild for this area. In order to accomplish the necessary testing, a series of synoptic and continuous temperature monitoring stations were established to measure the diffusion of Marshall steam stations condenser cooling water. A complete weather station records wind speed and direction; solar radiation; relative humidity, rainfall; and maximum and minimum weekly temperatures. Water is drawn from the hypolimnion of an adjoining lake by use of an inverted skimmer. Heat dissipation patterns are displayed for various times of the year and under different meteorological and plant loading conditions by graphic illustrations. Conclusions were: (a) during the colder months of the year, the heated water spreads over the lake surface, where it is quickly cooled by the air and wind, (b) in the hot summer months, use of the cold bottom water for cooling results in discharge temperatures close to those of the lake surface water, (c) extensive temperature surveys have shown that only a small part of Lake Norman's cooling capacity is required to dissipate the waste heat from the Marshall Steam Station. (Guerrero-Vanderbilt)
W70-02713

A HYDRAULIC MODEL STUDY OF HEAT DISSIPATION AT KINCARDINE POWER STATION,
Williamson (James) and Partners, Glasgow (Scotland).
David Ian Hunter Barr
Proc Instn Civil Engineers, Vol 10, p 305-320, July 1958. 9 fig, 27 ref

Descriptors: *Thermal pollution, *Model studies, *Hydraulic models, *Thermal power plants, *Density currents, Stratification.
Identifiers: *Heat dissipation.

A model investigation was conducted to study the heat-dissipating capacity of the River Forth at Kincardine, where a 760-MW steam station would draw 1,025 cusecs of condenser circulating water from the river. After mention of the calculations to ascertain the tidal flow at Kincardine, the operation of the model is described, including reference to observations made on the river to assist calibration of the model and to a concurrently operated model used to investigate outfall scour. The results obtained from the model are outlined and comparison made between recordings for varying conditions. An estimate of heat losses for model and prototype is given, and it is shown that non-correspondence in this respect did not have a material effect on the results in the case of the Kincardine investigation. In the second part of the paper, the background to density-current simulation in models is discussed and flume experiments carried out in this connection are described. Some conclusions were: (a) as a result of the investigation, a considerable reduction in culvert length was made for the Kincardine project; (b) the model showed stratification in depths of less than 1 inch (4 ft prototype) and the degree of stratification was found sensitive to variation in basic density and to the outfall increments; (c) the technique for density current model studies is less fully developed than for models involving normal currents only, and there is scope for research on the subject. (Guerrero-Vanderbilt)

AN EVALUATION OF THE USE OF SELECTIVE DISCHARGES FROM LAKE ROOSEVELT TO COOL THE COLUMBIA RIVER,
Battelle-Northwest, Richland, Wash. Pacific Northwest Lab.
R. T. Jaske.
AEC Research and Development Report, BNWL-208, Feb 1966. 87 p, 24 fig, 7 tab, 17 ref.

Descriptors: *Cooling, *Heat transfer, Mathematical models, Computer models, Reservoirs, Streams, Density currents, Heat balance, Energy budget, Temperature, Thermal pollution, Thermal powerplants.

A review is conducted of the results and general operation of the annual Columbia River cooling program for 1963, 64, and 65. An effort was initiated to develop a digital computer model to solve cooling problems in rivers. In research operations with this model, an appropriate degree of agreement has been obtained between model calculations and measured data. It was found that the existence of density currents and subsurface jet formation cannot be ignored in the development of heat budgets because large errors are introduced by the transition from mixed flow to almost adiabatic flow conditions. A high degree of integration among the flood control, power, and cooling water users interests is required to minimize effects on fisheries. (Novotny-Vanderbilt)

INTERACTION OF INORGANIC AND ORGANIC FERTILIZER MATERIALS WITH PESTICIDES AS RELATED TO WATER QUALITY IN SOILS,
Arkansas Univ, Fayetteville. Dept. of Agronomy.
Donald A. Brown.
Available from the Clearinghouse as PB-188 913, $3.00 in paper copy, $0.65 in microfiche. Project completion report, Arkansas Water Resources Research Center, Sept 1969. 9 p, 2 tab, 2 ref. OWRR Project A-004-ARK.

Descriptors: *Diffusion (Self), Adsorption, *Pesticides, Nitrogen, Soils, Herbicides, *Separation techniques.
Identifiers: Time of interaction, Nitrogen sources.

Interaction of Fertilizers with Pesticides - The chemical, physical, and mineralogical analysis of Dundee silt loam, Crowley silt loam, and Sharkey clay were completed. A study of the effect of 6 nitrogen rates for 5 sources of nitrogen upon the adsorption of prometryne, aldrin and fluometuron over four time periods was completed. The effect of (NH4)2SO4, NH4NO3 and Nitrana upon the diffusion of fluometuron in agar, glass beads and Crowley silt loam was also measured. Adsorption of pesticides increased as the time of fertilizer-pesticide interaction was extended. The greatest adsorption of aldrin and prometryne was by Sharkey, followed by Crowley and Dundee. Increasing rates of nitrogen increased or decreased adsorption depending upon changes in pH and salt content. The diffusion of fluometuron in Crowley silt loam was affected by nitrogen sources, rate, and time of interaction. The movement was ten times slower than in glass beads or agar, indicating that a soil-fertilizer-fluometuron interaction was present. The adsorption and diffusion of these pesticides was found to be a very critical function of pH, salt content, and time of interaction.

FERTILIZATION OF LAKES BY AGRICULTURAL AND URBAN DRAINAGE,
Massachusetts Inst. of Tech., Cambridge. Dept. of Sanitary Chemistry.
Clair N. Sawyer.
New England Water Works Association, Vol 61, No 2, p 109-127, June 1947. 5 fig, 6 tab, 6 ref.

Descriptors: *Sewage disposal, *Agricultural watersheds, *Runoff, *Fertilization, Lakes, Sewage treatment, Sewage bacteria, Nitrogen, Phosphorus, Algae, Copper sulfate, Effluents, Microcystis aeruginosa.
Identifiers: *Urban drainage, *Agricultural drainage, Biological response, Fertilization survey, Madison Lakes (Wis), Lake Mendota (Wis), Lake Waubesa (Wis), Lake Kegonsa (Wis).

The reported investigations disclose that agricultural drainage contributes annually about 4,500 pounds of nitrogen and 255 pounds of phosphorus per square mile of the watershed. Biologically treated sewage supplies annually approximately 6.0 of nitrogen and 1.2 pounds of phosphorus per capita, thus equating the enrichment of lake water from 1 square mile of agricultural drainage to 750 persons for nitrogen and to 212 persons for phosphorus. In 1946, lakes Monona, Waubesa, and Kegonsa, located on the outskirts of the city of Madison, received approximately 1,300 tons of nitrogen and 215 tons of phosphorus in organic and inorganic forms. The lakes retained from 30 to 60% of nitrogen received. The phorphorus concentration in lakes Waubesa and Kegonsa attained the high level above 0.25 parts per million (ppm) as compared with 0.01-0.02 ppm concentration found in less polluted lakes of southern Wisconsin. Importance of the hypolimnion, the nitrogen:phosphorus ratio, and a 'round-the-calendar' records is stressed. Microcystis aeruginosa was a particularly obnoxious by-product of eutrophication, either because of its inherent reproductive potential or resistance to copper sulfate. Other data of this report have considerable immediate as well as historical interest. (Wilde-Wisconsin)

HYDROBIOLOGICAL CONTROL OF THE TREATMENT OF WASTE WATERS IN ACCUMULATION PONDS (CZECH),
Technical Univ. of Prague (Czechoslovakia).
V. Sladecek.
Voda, Vol 37, No 4, p 125-126, 1958. 1 fig, 7 ref.

Descriptors: *Water treatment, *Fish farming, *Ponds, *Pollution abatement, Fermentation, Pollutants.
Identifiers: *Polluted discharge, *Burned lime, Hyperputrifaction, Polyputrifaction, Alpha-mesoputrifaction, Beta-mesoputrifaction, Polluted discharge, Accumulation ponds, Sugar beets.

A method is described for purification of liquid discharged from sugar beet factories introduced by Pytlik (1952). The technique consists of anaerobic fermentation of liquid stimulated by two additions to accumulation ponds of finely ground burned lime at a rate of 7500 kilograms/hectare; the first application is made in the fall and the second in winter. In the spring the pond is planted with fish. Aside from purification of the polluted liquid, the method provides from 300 to 500 kilograms/hectare of fish per year. The process of purification, according to the author, exhibits the following four phases: (1) Hyperputrifaction, during 4-1/2 winter months (fifth class of pollution, anaerobiosis); (2) Polyputrifaction, during 1 1/2 spring months (fifth class of pollution, transition to aerobic conditions); (3) Alpha-mesoputrifaction, during one spring month (fourth class of pollution, aerobic conditions); (4) Beta-mesoputrifaction, during 4-1/2 summer months (third class of pollution, aerobic conditions). The study of hydrobiological control failed to provide reliable results due to dilution of discharged liquid by surface runoff. (Wilde-Wisconsin)

5C. Effects of Pollution

WATER QUALITY IN INDUSTRIAL AREAS: PROFILE OF A RIVER,
New York Univ., N.Y. Inst. of Environmental Medicine; and Environmental Protection Administration of New York City.
Gwyneth P. Howells, Theodore J. Kniepe, and Merril Eisenbud.
Environ Sci and Technol, Vol 4, No 1, p 26-35, Jan 1970. 10 p, 5 fig, 2 photo, 1 tab, 6 ref.

Descriptors: Eutrophication, Estuaries, Hudson River, Streamflow, Tidal effects, Nutrients, Water pollution, Thermal pollution, Water utilization, Currents (Water), Saline water intrusion, Estuarine environment.
Identifiers: Hudson River Estuary.

The ecology and water quality of the lower Hudson River were studied to learn the effects of variable fresh water flow, tides, and industrial development on the distribution of inorganic pollutants, nutrients, pesticides, and heat in the estuary. Changes that might be expected from increased use are: An increasing nutrient load from domestic sewage and some industrial processes, an increasing heat load, and an increased demand for industrial and domestic water. Potential eutrophic nuisance species of algae are present in the river, and the shores are populated by animals indicative of sewage pollution. Yet, serious fouling and deoxygenation have so far been avoided for most of the river. Heat additions to the aquatic environment are a major concern. In the Hudson, the volume of tidal flow can be utilized to disperse such heat, at the same time, it is clear that the capacity of the

river as a heat sink is severely limited during the peak summer demand by a low net flow and high ambient air temperatures. The effects of water extraction for any purpose on the present hydrological pattern in the river remain largely unknown. It seems probable that the extent and duration of salt water intrusion up the river will increase. (Knapp-USGS)

INTERRELATIONS OF DISSOLVED ORGANIC MATTER AND PHYTOPLANKTON,
Michigan Univ., Ann Arbor. Dept of Zoology.
George W. Saunders.
The Botanical Review, Vol 23, No 6, p 389-409, 1957. 4 tab, 131 ref.

Descriptors: *Organic matter, *Phytoplankton, Limnology, Zooplankton, Algae, Colloids, Trace elements, Dissolved solids, Nutrients, Vitamins, Toxins, Inhibitors, Succession, Chlorella, Chelation, Ochromonas, Bacteria, Fungi, Aquatic plants, Assay, Distribution, Density, Chromatography, Radioactivity, Tracers, Water pollution effects, Physiological ecology, Algicides.
Identifiers: *Dissolved organic matter, Organic debris, Organic growth factors, Vitamin B1, Vitamin B6, Vitamin B12, Biotin, Histidine, Uracil, Reduced sulfur compounds, Antibiotic effects, Stimulants, Gonyaulax catenella, Gonyaulax tamerensis, Gymnodinium brevis, Mycrosystis, Algastatic substances, Algadynamic substances, Phormidine, Pandorinine, Scenedesmine, Microcrustaceans, Cytotoxic agents, Auxotrophy, Autotrophy, Heteretrophy, Nutrition, Physiology.

Limnologists attempt to explain distribution and interrelationships of freshwater organisms from the more conventional physical and chemical points of view. The biochemist and physiologist are beginning to understand basic metabolic pathways of synthesis and degradation. Micro-quantities of both organic and inorganic matter are significant to growth, behavior, and success of living organisms. With the new information from biochemistry and new tools and techniques, such as paper chromatography, chelate complexes, radioactive tracers, and microbiological assay, limnologists may complete the unified picture. The attack may be initiated by use of pure cultures in the laboratory to determine the basic requirements of the more significant algal forms in terms of their ability to utilize various organic substrates, requirement for growth factors, reaction toward antibiotics, and their requirement for trace metals. Limnologists in the field may determine yearly cycles of specific organic nutrients, vitamins, and trace metals. Many questions may be answered by correlating laboratory and field studies with analyses of populations and their succession in nature. These tools should be considered and used to usher in a new era in limnology and the investigation of interrelations of dissolved organic matter, phytoplankton, and zooplankton. (Jones-Wisconsin)

NUTRIENT LIMITATION OF SUMMER PHYTOPLANKTON GROWTH IN CAYUGA LAKE,
Cornell Univ., Ithaca, N.Y.
D. H. Hamilton, Jr.
Limnology and Oceanography, Vol 14, No 4, p 579-590, July 1969. 12 p, 3 fig, 9 tab, 32 ref.

Descriptors: *Phytoplankton, *Eutrophication, *Lakes, *Nutrients, Carbon radioisotopes, Silicates, Water chemistry, Phosphates, Photosynthesis, Phosphorus, Sampling, Chlorophyll, Potassium compounds, Magnesium compounds.
Identifiers: Lake Cayuga (NY).

The effect on natural phytoplankton populations of various components of a defined culture medium has been assayed by measurement of C-14 assimilation under controlled conditions. Phytoplankton populations in Cayuga Lake, N.Y. are at least partially limited by nutrient availability during the period of stable conditions succeeding the vernal bloom. Sodium silicate consistently stimulated photosynthesis in June, July, and August; this is associated with the presence of silicon-requiring plankters, including some nondiatomaceous forms, and correlated with nutrient levels in situ. Both phosphate and silicate were present in low concentration. Despite low natural concentration, augmented phosphate did not stimulate photosynthesis, and some evidence suggests inhibition by phosphorus. Inhibition and enhancement by other components of the medium are discussed, as well as modifications of the C-14 enrichment experiment technique (Gabriel-USGS)

LIMITATION OF ALGAL GROWTH IN SOME CENTRAL AFRICAN WATERS,
Malawi Univ., Limbe.
Brian Moss
Limnology and Oceanography, Vol 14, No 4, p 591-601, July 1969. 11 p, 3 fig, 4 tab, 20 ref.

Descriptors: Algae, Productivity, *Eutrophication, *Water chemistry, Pollutants, Algal control, Nitrates, Phosphates, Sulfates, Seasonal, Lakes, Sampling, Ponds, Rivers, Reservoirs, Air temperature, Rain, Geology, Mapping, Nutrients.
Identifiers: Africa, Malawi

Levels of inorganic nutrients (nitrate, phosphate, sulfate) available for algal growth in nine bodies of water in Malawi were investigated, using enrichment bioassays with naturally present algae as test organisms. Nitrate or nitrate plus phosphate were potentially limiting to algal growth. There was no evidence of sulfate limitation. The relevance of enrichment bioassays to whole water body situations is considered. A model, illustrating invalid use of assays in the interpretation of seasonal succession in algal communities, is discussed. (Gabriel-USGS)

INTERACTION OF PESTICIDE POLLUTANTS AND AQUATIC FOOD-CHAIN ORGANISMS,
Clemson, Univ., S.C.
John K. Reed
Available from the Clearinghouse as PB-188 794, $3.00 in paper copy, $0.65 in microfiche. Water Resources Research Institute, Technical Completion Report, Nov 1969. 18 p, 2 tab, 9 ref, append OWRR Project A-013-SC.

Descriptors: *DDT, *Pesticide residues, Fish physiology, Absorption, Pesticide kinetics, Minnows, Gas chromatography, Radiochemical analysis.
Identifiers: *Biological magnification.

Small golden shiner minnows, Notemigonus crysoleucas, were exposed to a constant level of DDT either in water or in food. The DDT was ring labelled with carbon-14 and was assayed in a liquid scintillation system and by gas-liquid chromatography. Over a 15-day period the mean aqueous DDT concentration was 265 parts per trillion which resulted in a level of 180 ppb absorbed to the outside of the fish and 22,530 ppb absorbed internally. This represented nearly a 100,000 fold accumulation of DDT in fish from flowing water. When fish were fed contaminated food, no DDT was found absorbed externally on the fish or in the water. In both cases the level in the fish increased with time.

THE ECOLOGY OF THE YOUNG FISHES OF THE WEWEANTIC RIVER ESTUARY,
Massachusetts Univ., Amherst. Water Resources Research Center.
Charles F. Cole.
Available from the Clearinghouse as PB-188 795, $3.00 in paper copy, $0.65 in microfiche. Massachusetts Water Resources Research Center, Completion Report 69-1, Nov 1969. 15 p. OWRR Projects A-002-MASS

Descriptors: *Estuarine fisheries, *Pesticide residues, *Fish populations, Massachusetts, Water pollution effects.
Identifiers: *Weweantic River, Buzzards Bay, Fisheries (Seasonal distribution), Fisheries (Distribution patterns).

The Weweantic River estuary in upper Buzzards Bay, Massachusetts was selected in 1964 for a long-term study of estuarine fishes and the factors that control their levels of abundance. Seven master's and two doctoral studies have been conducted during this period on the seasonality of fish eggs, larvae, juveniles and adults and on the life histories of the tomcod, rainbow smelt, cunner, tautog, and winter flounder. Additional studies on the seasonal distribution of certain physical and chemical parameters and studies on the historical use of the watershed since colonial times were carried out. Pesticide residue levels and their possible effects in winter flounder have also been investigated. Methods for quantifying ichthyoplankton sampling for in-situ mortality studies of winter flounder and rainbow smelt have also been evaluated. Between-year variation in the natural environmental parameters is a strong factor regulating size of year class in at least the tomcod, rainbow smelt and winter flounder. The study of man caused environmental modifications on populations of estuarine

fishes must take into consideration the scope and nature of these naturally caused variations in population size and structure.

EFFECTS OF CHLORINATED HYDROCARBON INSECTICIDES ON THE FRESHWATER SEED SHRIMP,
South Dakota Univ., Vermillion.
Dr. James C. Schmulbach.
Available from the Clearinghouse as PB-188 796, $3.00 in paper copy, $0.65 in microfiche. Completion Report, Nov 1969. 57 p, 15 tab, 3 fig, 39 ref. OWRR Project A-015-SDAK.

Descriptors: *Insecticides, Bioassay, Crustaceans, Pesticide residues, *Pesticide toxicity, Aldrin, Dieldrin, Bioassay, Lethal limit, Water pollution effects, *Chlorinated hydrocarbon pesticides.
Identifiers: *Ostracods.

The acute toxicities of various mixtures of the two insecticides against laboratory-reared, insecticide-free ostracods were determined. The 24-hour immobility EC50's were 1.15 and 2.45 ppb for aldrin and dieldrin, respectively. Ostracods which were laboratory-reared in the presence of insecticide were also tested to determine if increased resistance or sensitivity to the chemicals had occurred by virtue of chronic exposure. Sublethal exposure to either insecticide through several generations produced populations which were more susceptible to both insecticides. In all instances, ostracods were approximately twice as senitive to aldrin as to dieldrin. Bioassay results using combinations of aldrin and dieldrin demonstrated no synergism or potentiation with respect to the two insecticides. The phenomena of biological accumulation, storage, degradation, and elimination of aldrin and dieldrin were examined. Aldrin was consistently absorbed at a rate approximately twice that of dieldrin. Both insecticides were accumulated against a concentration gradient and stored in the ostracod body. Primary absorption of both insecticides occurred through the gut and body integument; principal storage was in the body per se, with lesser amounts being located in appendages and incorporated in or adsorbed to the shell. Aldrin was rapidly metabolized to dieldrin within the body. No metabolism of dieldrin was observed, but dieldrin was, in part, eliminated from the body when exposed ostracods were placed in insecticide-free water. A complete report of this research is contained in a Degree of Doctor of Philosophy dissertation by Joseph A. Kawatski entitled, 'Toxicity and Methabolism of Two Chlorinated Hydrocarbon Insecticides (Aldrin and Dieldrin) in the Freshwater Ostracod Chlamydotheca arcuata (Sars).'

INFLUENCE OF STARVATION ON SELECTED TEMPERATURE OF SOME SALMONIDS,
Carleton Univ., Ottawa (Ontario). Dept. of Biology.
M. Yaqub Javaid, and John M. Anderson.
Journal, Fisheries Research Board of Canada, Vol 24, p 1515-1519, 1967. 1 fig, 16 ref.

Descriptors: Temperature, *Atlantic salmon, *Brook trout, *Rainbow trout, Salmonids.
Identifiers: *Starvation, *Temperature selection.

Starvation was observed to cause changes in the selected temperature of Atlantic salmon, brook trout, and rainbow trout. Fingerlings 2-3 inches in length were acclimated for one month at 20 deg C before 50 fish of each species were isolated. Starvation periods were 22 days, 20 days, and 15 days for salmon, brook trout, and rainbow trout respectively. The fish were tested in groups of 5 or 6 and tests were replicated five times with different fish in each case. In Atlantic salmon an upward shift occurred within 24-28 hours after cessation of feeding. In brook trout and rainbow trout, a downward shift occurred within 24 hours after cessation of feeding. Brook trout showed an initial overshoot. These changes were maintained statistically constant throughout the starvation period, but in all cases the selected temperature returned to its pre-starvation value within 24 hours after resumption of feeding. (Speakman-Vanderbilt)

EFFECTS OF SIMULTANEOUS VARIATION OF TEMPERATURE AND DISSOLVED OXYGEN ON THE RESISTANCE OF FISHES TO CONTROLLED POLLUTANTS,
Connecticut Univ., Storrs.
Walter R. Whitworth.
Research Project Technical Completion Report, Nov 1969. 2 p. OWRR Project A-003-CONN.

Descriptors: *Lead, *Fluctuating temperature, *Brook trout, Fluctuating oxygen, Water pollution effects.

Slug doses of lead administered once a day 5 days/week to brook trout exposed to simultaneous diel fluctuations of dissolved oxygen and temperature showed that concentrations of 25 mg/liter of lead reduced growth. Concentrations of 15 mg/liter had little apparent effect and concentrations of 10 mg/liter had no deleterious effects on growth. Lead levels that were effective had a greater effect (1) when oxygen fluctuated on a diel basis to 2.4 and 3.5, and (2) when temperatures fluctuated from 10.0-16.0. Short-term toxic effects of lead on brook trout, bridled shiners, blacknose dace and banded killifish, at temperatures of 10-21 C, showed (96 hr. EC50) from 4 to 40 mg/liter. Oxygen consumption of bridled shiners was not significantly affected by exposures to 2 and 8 mg/liter of lead. Lead levels of approximated 15 mg/liter had no significant effects on the eggs of brook trout and American shad.

STUDIES ON PHOSPHOROUS TRANSFORMATIONS IN EUTROPHIC LAKES,
Connecticut Univ., Storrs.
Richard C. Tilton.
Connecticut Institute of Water Resources, Research Project Technical Completion Report, Nov 1969. 6 p, 3 ref. OWRR Project A-017-CONN.

Descriptors: *Detergent, *Microbial degradation, *Eutrophication, Lakes.
Identifiers: *Phosphate.

Phosphate has been implicated in the active eutrophication of lakes and ponds. Household and industrial detergents contribute a major portion of phosphate to waste waters. Detergent phosphate enters the water as longchain linear and cyclic phosphate and in such form may not be available for use by algae and green plants without prior bacterial decomposition. Twenty five detergents were analyzed by cellulose thin layer chromatography (TLC) for phosphate compounds and these detergents were subdivided into five major groups depending on the particular phosphates present. Representatives of the major groups were used as sole phosphorous sources for each of eleven species of aquatic bacteria. Phosphorous degradation products were determined by TLC. Data indicated that the ability to decompose detergent phosphates depended upon the species of bacterium tested. Some bacteria utilized pyrophosphate tripolyphosphate, tetrapolyphosphate and trimetaphosphate as phosphorous sources and excreted large amounts of orthophosphate into the medium, while others failed to grow on these complex phosphorous sources. Results suggested that aquatic bacteria play a significant role in the decomposition of detergent phosphate in waste water and to a large extent in the aquatic phosphorous cycle.

CORRELATION OF STRUCTURE VS ACTIVITY OF POLLUTANTS OF FRESH WATER,
Rhode Island Univ., Kingston. Dept. of Pharmacy.
Howard W. Bond, and George C. Fuller.
Technical Completion Report, Rhode Island Water Resources Center, 1969. 16 p. OWRR Project A-021-RI.

Descriptors: *Thiol affinity-sulfhydryl-reactive agents, *Sulfhydryl-thiol affinity-rate assay, *Cysteine-B-nitrostyrene interaction, UV spectrophotometry-reaction monitoring, *Molluscicides.
Identifiers: *Sulfhydryl reactivity, *Oxygen uptake inhibitions, *Cysteine, *B-Nitrostyrenes.

Thirty-one B-nitrostyrenes were tested for their toxicity to the fresh water snail, Australorbis glabratus. All were highly toxic, with B-nitrostyrene itself being the most toxic. Inhibition of oxygen uptake was significantly ($P<0.05$) correlated with sulfhydryl reactivity of the derivatives studied. Homogenate oxygen uptake inhibition was associated with reduced tissue sulfhydryl content. Preincubation of homogenates with cysteine antagonized the effect of B-nitrostyrene on oxygen uptake. Saturation of the B-nitrostyrene nitroolefinic bond resulted in a product (1-phenyl-2-nitroethane) with diminished ability to inhibit oxygen uptake, as well as reduction of sulfhydryl reactivity. These data indicate that the effect of the B-nitrostyrenes on oxygen uptake is mediated through an interaction between the B-nitrostyrene and tissue sulfhydryl material.
W70-02753

ECOLOGY OF SELECTED AQUATIC BACTERIA IN THE SNAKE RIVER,
Washington State Univ., Pullman
Charles H. Drake
Available from the Clearinghouse as PB-188 934, $3.00 in paper copy, $0.65 in microfiche. Completion Report, Washington Water Resources Research Center, Dec 1969. 12 p, 3 tab. OWRR A-018-Wash

Descriptors: Aquatic microbiology, Water quality, *Bioindicators, Pseudomonas, Sulfur bacteria, Water pollution sources, Idaho, Washington

Total counts and counts of selected bacterial genera were made on water samples from the Snake River above and below the Lewiston-Clarkston area. Fluorescent species of Pseudomonas were found to be an important part of the natural aquatic flora with their numbers approximately doubling below the urban area. Counts were made by the Most Probable Number method on a selective medium with positive tubes determined by fluorescence under long-wave ultraviolet light. Numbers of the sulfate reducing anaerobic Desulfovibrio, present in the water from bottom scour, were also determined. Because of the high sulfate content of the water, there was no increase in numbers below the two cities as compared to upstream samples. Total counts on standard plate count agar seemed to mostly detect extraneous non-aquatic species needing high concentrations of organic foods. Counts on the low-nutrient concentration Henrici's agar gave up to 20-fold higher counts. On this medium, Sphaerotilus was detected below but not above the two cities. Indications were that neither phosphate nor fixed nitrogen were limiting factors for the bacterial population. Counts of most species were lowest during the summer when the river water is primarily long-impounded water, from power dams, which has been exhausted of nutrients.

PHYTOPLANKTON FLORA OF NEWFOUND AND WINNISQUAM LAKES, NEW HAMPSHIRE,
New Hampshire Univ., Durham. Dept. of Botany
G. K. Gruendling, and A. C. Mathieson.
Rhodora, Vol 71 (787): p 444-447, 1969. 42 fig, 117 ref. OWRR Project A-010-NH.

Descriptors: *Algae, *Trophic levels, Aquatic environment, Water quality, Nutrients, Northeast U S, Ecological distribution, Biological indicators, New Hampshire.
Identifiers: *Newfound Lake, *Winnisquam Lake, Water and plants, Water pollution effects, Ecology, Water quality characterization.

A total of 185 taxa of fresh water algae (primarily phytoplankton) were identified at Winnisquam (partially eutrophic) and Newfound (Oligotrophic) lakes. Of the 142 taxa recorded at Winnisquam Lake 85 were found exclusively at this location. The green algae contributed the greatest number of species, but the bulk of the standing crop was composed of blue-green algae. A total of 100 taxa were recorded at Newfound Lake, and 43 of these were found exclusively at Newfound Lake. The largest number of species were green algae. During the summer the phytoplankton flora at Winnisquam Lake was primarily composed of members of the Chlorophyceae and Cyanophyceae. Members of the Bacillariophyceae, Chrysophyceae and Chlorophyceae (mainly desmids) contributed the largest number of species during the spring and fall. Diatoms were the major component of the winter flora. The summer and fall flora at Newfound Lake was primarily composed of members of the Cyanophyceae, Chlorophyceae (especially desmids) and Chrysophyceae. The diatoms and golden-brown algae contributed the largest number of species during the winter and spring.

PHYSICAL, CHEMICAL, BACTERIAL, AND PLANKTON DYNAMICS OF LAKE PONTCHARTRAIN, LOUISIANA,
Louisiana Water Resources Research Inst., Baton Rouge.
Daniel H. Stern, and Michele Stern.
Available from the Clearinghouse as PB-188 915, $3.00 in paper copy, $0.65 in microfiche. Technical Report 1R-4, La Water Resources Research Inst, Sept 1969. 60 p, 2 fig, 47 tab, 33 ref. OWRR Project A-019-LA.

Descriptors: *Limnology, *Chemical properties, *Ammonia, *Coliforms, *Phytoplankton, *Zooplankton, *Lake Pontchartrain, Saline lakes, Storm runoff, Physical properties, Nitrification, Nitrites, Nitrates, Dissolved oxygen, Turbidity, Phosphates, Nutrients, Water sports.

Preliminary and intensive studies from November 1968 to July 1969 showed that the discharge of storm water into Lake Pontchartrain, Louisiana affects the water quality and bio-rhythm of aquatic microorganisms. Especially after heavy rains in Orleans Parish, the presence of coliforms renders the nearshore water and beaches unsafe for some water sports. Storm drainage from Jefferson Parish also supplies coliforms that are transported to the New Orleans shoreline. Phosphates, nitrates, and nitrites nourish and bring about increases in phytoplankton and bacteria. Lake sediments, stirred up by wind waves and during heavy rains, increase the turbidity; the reduced light available for photosynthesis results in the death of phytoplankton, which add to the bottom organic materials and subsequently furnish food for more planktonic growth, and thus hastens the filling of the lake. The use of total instead of fecal coliform counts does not give the true degree of pollution because no consistent relationship was found between the two. Recommendations include: counting of fecal coliforms to determine water quality; prohibition or discouragement of swimming, skiing, and other primary water sports at certain beaches after summer rains; careful regulation of proposed chlorination of storm water owing to presence of ammonia, which retards the disinfection process, and because of unreacted chlorine, which will disrupt the natural food chain; and basin-wide cooperation to prevent or reduce further pollution.

ALGAE IN RELATION TO MINE WATER,
West Virginia Univ., Morgantown. Water Research Inst.
H. D Bennett.
PB-188 906. West Virginia Water Research Institute, Journal Report 1, (Reprint from Castanea Vol 34, No 3, p 306-328, Sept 1969). OWRR A-007-WVA.

Descriptors: *Algae, *Acid mine water, *Habitats, *Environmental effects, *Limiting factors, Benthic flora, Benthos, Mine water, Water pollution, Water pollution effects, Acid streams, Mine drainage, Chlorophyta, Chrysophyta, Euglenophyta, Cyanophyta, Diatoms, Aquatic habitat, Population.
Identifiers: *Cytological effects, Algal population.

An annual cycle of bimonthly sampling was done to obtain information on species of algae tolerant to acid mine water and on chemical factors related to ecology of algae. Nitrate, phosphate, and calcium appeared not to be limiting or modifying. Correlation was lacking between factors except acidity, iron, and pH. A range for these characterized each habitat, and they appeared controlling on algal population in more-acid streams. The total number of genera and species compared favorably with numbers reported from 'unpolluted' waters. Nearly half the total species found in more-acid streams equally were in less-acid creeks, rivers, and ponds. Algae characteristic of mine water were those common to the other habitats. Reduction in numbers of species at higher acidity and lower pH was primarily in species less common to a range of habitats. The range of acidity and pH at a site is characterized by a range in species number and abundance a change in abundance being dependent on the species. Some such as Euglena mutabilis Sch., Eunotia tenella (Grun) Cleve, and Pinnularia braunii (Grun) Cleve are most abundant in mine-polluted water. (Dodson-West Virginia)

PHYTOPLANKTON POPULATIONS IN RELATION TO TROPHIC LEVELS OF LAKES IN NEW HAMPSHIRE, U.S.A.
New Hampshire Univ., Durham. Dept. of Botany
G. K. Gruendling, and A. C. Mathieson.
Available from the Clearinghouse as PB-188 912, $3.00 in paper copy, $0.65 in microfiche. Completion Report, University of New Hampshire Water Resources Research Center, Research Report No 1, June 1969. 81 p, 15 fig, 9 tab. OWRR Project A-010-NH.

Descriptors: *Algae, Aquatic environment, *Aquatic algae, Water quality, *Trophic levels, Nutrients, Northeast U.S., Ecological distribution, Frequency distribution, Population, Biological indicators, New Hampshire.
Identifiers: Plant growth, Water and plants, Water pollution effects, Ecology, Effects of pollution, Water quality control, Winnisquam Lake, Newfound Lake.

The relationship between composition, periodicity and abundance of phytoplankton species and the trophic status of two New Hampshire lakes (Winnisquam and Newfound) were investigated. Newfound Lake is oligotrophic, while Winnisquam is undergoing rapid eutrophication. The differences in the total standing crop at the two lakes were related with their differences in nutrient concentrations. Orthophosphate appeared to be the primary limiting factor of algal growth at Newfound Lake, while light, temperature and possible extracellular products were the primary limiting factors at Winnisquam Lake. A discussion of the factors influencing the periodicity, abundance and distribution of phytoplankton species at the two lakes is presented, and the results are compared with previous findings. The species composition at the lakes was dependent upon their trophic status. Dominant species were considered to be the best indicators of trophic levels. A summary of possible rare indicator organisms is also included. The phytoplankton quotients proposed by various authors were applied to the lakes. Most of the indices correctly designated the eutrophic lake, but not the oligotrophic one.

STRUCTURAL CHARACTERISTICS OF BENTHIC ALGAL COMMUNITIES IN LABORATORY STREAMS,
Oregon State Univ., Corvallis. Dept. of Botany.
C. David McIntire.
Ecology, Vol 49, No 3, p 520-537, 1968. 5 fig, 6 tab, 31 ref.

Descriptors: *Benthic flora, *Algae, *Biological communities, *Laboratories, *Streams, Light intensity, Currents (Water), Velocity, Diatoms, Seasonal, Biomass, Pigments, Productivity, Periphyton, Chlorophyta, Chrysophyta, Cyanophyta, Sampling, Phytoplankton, Organic matter, Chlorophyll, Dynamics, Temperature, Silts, Standing crop, Ecology, Photosynthesis, Respiration, Carbon dioxide, Nutrients, Dissolved oxygen, Lotic environment.
Identifiers: Species diversity, Autecology, Morphology, Export losses, Chemosynthesis, Abundance.

Effects of light intensity and current velocity on species composition and ecological properties of benthic algal communities were investigated in laboratory streams. Of 15 diatom taxa studied, only Melosira varians, Meridion circulare, and Navicula radiosa were more abundant in streams receiving 700-foot-candle illumination than in those receiving 150-foot-candle. Achnanthes exigua, A minutissima, Meridion circulare, Rhoicosphenia curvata, and Navicula radiosa were indifferent to current velocity, which had positive effect on abundance of Nitzschia linearis, Achnanthes lanceolata, Navicula cryptocephala, N minima, N seminulum, Synedra ulna, Gomphonema parvulum, G angustatum, Cocconeis placentula, and the lanceolate Nitzschia. Melosira varians exhibited negative response to current velocity; six taxa, other than diatoms, Anabaena variabilis and Tribonema minor were more abundant in streams with higher light intensity, but only one species, Phormidium retzii, was more abundant in streams with current than in standing water. At a particular season, light intensity, and current velocity--laboratory stream conditions--allow establishment of algal communities with comparatively unique species composition and characteristic biomass, pigment concentration, and increment of export. To understand factors influencing productivity in these communities, some knowledge is necessary of autecologies of community constituents, and mechanisms regulating species composition and floral diversity. SOME FACTORS AFFECTING RESPIRATION OF PERIPHYTON COMMUNITIES IN LOTIC ENVIRONMENTS,
Oregon State Univ., Corvallis. Dept. of Botany.
C. David McIntire.
Ecology, Vol 47, No 6, p 918-930, 1966. 2 fig, 6 tab, 18 ref.

Descriptors: *Respiration, *Periphyton, *Ecosystems, *Lotic environment, Metabolism,

Velocity, Dissolved oxygen, Temperature, Primary productivity, Biomass, Photosynthesis, Currents (Water), Circulation, Diatom, Chlorophyta, Bacteria, Rotifers, Tension, Diffusion, Oregon, Water pollution effects, Diptera, Midges.
Identifiers: Substrate, Willamette Valley (Oregon), Stigeoclonium, Oedogonium, Tribonema minor, Melosira, Achnanthes, Anabaena, Phormidium retzii, Epithemia, Navicula, Cocconeis, Fragilaria, Closterium, Rhopalodia gibba, Cilliates, Synedra ulna.

Using laboratory streams, a respirometer chamber, and a Gilson differential respirometer, periphyton respiration in lotic environments was studied. Respiration rates expressed on an ash-free dry weight basis, determined for sections of intact communities in air-saturated water, varied between 0.8 milligrams oxygen per gram/hour at 7.2 C and 2.3 milligrams oxygen/gram per hour at 18.6 C for a community grown at current velocity of 38 centrimeters/second, and between 0.4 milligrams at 7.2 C and 1.7 milligrams at 18.5 C for a community grown in current of 9 centimeters/second. These values agreed with rates obtained manometrically in Warburg experiments and values reported in literature. Periphyton developed in swifter current exhibited greater metabolic response to shaking than material grown in slow current. Fast-current communities usually had higher respiratory rate than slow-current. Respiration rates in both decreased when dissolved oxygen concentration was below air saturation, indicating sessile lotic communities were particularly susceptible to oxygen exhaustion in vicinity of respiring cells. Enhancement of respiration with increasing oxygen tension over air saturation was more pronounced at 5 C than at 13 C. Oxygen concentrations over air saturation had greater effect on respiration when flasks were unshaken. (Jones-Wisconsin)

KINETICS OF NUTRIENT-LIMITED GROWTH,
Gulbenkian Inst. of Science, Oeiras (Portugal). Lab. of Microbiology.
N van Uden.
Annual Review of Microbiology, Vol 23, p 473-486, 1969. 60 ref.

Descriptors: *Kinetics, *Nutrients, *Growth rates, Microbiology, Reviews, Diffusion, Yield equations, Metabolism, Yeasts, Water pollution effects, Cycling nutrients, Biomass.
Identifiers: *Microbial growth, *Kinetic theory, *Nutrient limited growth, Michaelis-Menten equations, Monod equation, Saccharomyces cerevisiae, Glucose transport, Candida utilis, Aerobacter aerogenes, Xylitol transport, Escherichia coli, Aerobacter cloacae, Hydrogenomonas, Thiobacillus neapolitanus, Debaryomyces subglobosus, Competitive inhibition, Transport-limited growth, Apparent diffusion, Specific maintenance rates, Energy metabolism, Microbial populations, Nutrient concentrations, Chemostats, Continuous culture, Balanced growth, Diffusion coefficients, Specific death rates, Heterotrophy.

Specific growth rate response of an exponentially growing microbial population to variations in concentration of an essential nutrient, present in non-toxic amounts, indicates that this nutrient limits growth. Microbial growth in chemostats and in open seas are examples of nutrient-limited growth. This publication reviews 60 papers, dated 1942-1969, bearing on the development of kinetic equations to define and describe such growth. 43 equations are presented relating to nutrient-limited growth of microbial populations distributed among the following areas of consideration: fundamental relationship; Michaelis-Menten transfers, including transport-limited growth and competitive inhibition; diffusion transfer, including true and apparent diffusion; and relationship of yield factors (here defined as the sum of biomass and metabolite production) to specific maintenance rate, to parameters of energy metabolism, and to maintenance analysis. Kinetics reviewed are valid for steady-state growth in chemostats, where specific growth rate is often well approximated by the dilution rate of the chemostat. While the equations are useful, none of them constitute a theoretically sound base for development of a kinetic theory of nutrient-limited microbial population growth. While examples are chosen from among the heterotrophic bacteria and yeasts, it appears that equations are equally applicable to algal growth, although not so stated. (Eichhorn-Wisconsin)

CLADOPHORA GLOMERATA AND CONCOMITANT ALGAE IN THE RIVER SKAWA. DISTRIBUTION AND CONDITIONS OF APPEARANCE,
Wyzsza Szkola Rolnicza, Olsztyn-Kortowa (Poland). Katedra Botaniki.
Henryk Chudyba.
Acta Hydrobiologica, Vol 10, No 1-2, p 39-84, 1968. 27 fig, 12 tab, 82 ref.

Descriptors: *Cladophora, Algae, Aquatic algae, Aquatic microbiology, Aquatic productivity, Chlorophyta, Gonophyta, Diatoms, Environmental effects, Limnology, Ecology, Ecological distribution.
Identifiers: *Skawa River (Poland), Montane river course, Carpathian submontane region, Gradients (River), Thalli, Schizomycetes, Cyanophyta, Fungi, Bacillariophyceae, Charophyta, Rhodophyta.

Results of 137 samples collected during September 1-27, 1963 from the River Skawa, Poland, indicated that two groups can be distinguished by thalli: C glomerata rheobenthicum from places with current; C glomerata limnobenthicum from places with no current. The thalli appeared yellow or brown as a result of attached diatoms. The rapidity of current did not play any significant role in formation of the community of accompanying algae. Epiphytes were mainly diatoms, followed by green and blue-green algas. Pennatae diatoms were most common; Navicula and Nitzschia were the most common genus. Groups of algae accompanying C glomerata at all sampling places form one type of community and a single phytocenose with a similar floristic composition and structure. (Fitzgerald-Wisconsin)

CONTRIBUTIONS TO THE KNOWLEDGE OF NITROGENOUS COMPOUNDS AND PHOSPHATE IN THE LAKE WATERS OF JAPAN,
Tokyo Imperial Univ. (Japan). Geographical Inst.
Shinkichi Yoshimura.
Proceedings Imperial Academy of Japan, Vol 8, No 3, p 94-97, 1932. 1 tab, 3 ref.

Descriptors: *Eutrophication, *Nutrients, *Nitrogen, *Phosphorus, Ammonium, Nitrate, Nitrite, Organic nitrogen, Phosphate.
Identifiers: Lake types, Japan.

The amounts of ammonium-nitrogen, (nitrate+nitrite)-nitrogen, albumoid ammonium and soluble phosphate in the waters of 34 Japanese lakes, varying in trophic states, are tabulated. No determination of total nitrogen was made. The general order of each of the constituents measured was: eutrophic greater than mesotrophic greater than oligotrophic. There was little relationship between inorganic nitrogen and soluble phosphate content of the waters. The average nitrogen content (milligrams/liter) was 0.2, 0.2-0.1 and 0.1-0.0 for eutrophic, mesotrophic and oligotrophic lakes, respectively. The corresponding average phosphate contents were 0.1, 0.1-0.05 and 0.05-0.0. The total nitrogen and phosphate contents were constant throughout the year. Shallow lakes were turbid and yellow-colored and high in nitrogen and phosphate while deep lakes were clear and low in nitrogen and phosphate. (Keeney-Wisconsin)

MEASURING ORGANIC MATTER RETAINED BY AQUATIC INVERTEBRATES,
Georgia Univ., Sapelo Island. Marine Inst.
R. E. Johannes, and Masako Satomi.
Journal Fisheries Research Board of Canada, Vol 24, No 11, p 2467-2471, 1967. 1 tab, 14 ref.

Descriptors: *Organic matter, *Invertebrates, *Aquatic animals, Energy, Metabolism, Carbon, Respiration, Rates, Retention, Diatoms, Georgia.
Identifiers: Assimilation, Growth, Ingestion, Release, Palaemonetes pugio, Nitszchia closterium, Sapelo Island (Georgia).

A parameter of energy metabolism by aquatic invertebrates is determine by subtracting the total rate of release of particulate and dissolved organic carbon from input rate of organic carbon in food. This is a measurement of what might be termed retention of organic carbon: the rate at which ingested organic carbon is retained by the animal for growth and respiration. Calculation of this rate requires no knowledge of what fraction of the release products is undigested food and what fraction is derived from assimilated material. Regardless of origin of organic release products, they represent a loss to the animal. This total loss subtracted from food input constitutes the real measure of the organic carbon ingestion rate:total organic carbon release rate is calculated, it can be seen that this value also equals organic carbon assimilation rate:release rate of assimilated organic carbon. Thus, retention will always be less than assimilation. Determination of organic carbon retention by Palaemonetes pugio, feeding on the diatom, Nitszchia closterium, is reported. (Jones-Wisconsin)

PHOSPHORUS EXCRETION AND BODY SIZE IN MARINE ANIMALS: MICROZOOPLANKTON AND NUTRIENT REGENERATION,
Georgia Univ., Sapelo Island. Marine Inst.
R. E. Johannes.
Science, Vol 146, No 3646, p 923-924, Nov 1964. 1 fig, 13 ref.

Descriptors: Phosphorus, Size, Marine animals, *Microorganisms, Zooplankton, Nutrients, Weight, Biomass, Metabolism, Spectrophotometry, Mussels, Amphipoda, Oxygen, Benthic fauna, Invertebrates, Crustaceans, Nannoplankton, Phosphorus radioisotopes.
Identifiers: *Excretion, *Regeneration, Phagotrophic flagellate, Tridacna crocea, Penaeus setiferus, Crassostrea virginica, Modiolus demissus, Uca pugnax, Salpa fusiformis, Littorina irrorata, Lembos intermedius, Artemia salina (Nauplii), Euplotes vannus, Uronema, Calanus finmarchicus, Ciliates, Release processes, Acartia clausi.

Animal excretions are a major source of plant nutrients in the sea. The microzooplankton, not retained by plankton nets, are often overlooked by marine ecologists and their role in nutrient cycles has never been evaluated. Examinations of unfiltered water samples reveal that microzooplankton may often constitute a considerable fraction of the total animal biomass. The smaller the animal the greater the metabolic rate per net weight. Nutrient excretion rate of microzooplankton should, therefore, be higher than that of net zooplankton per unit weight. Excretion rates are defined as the period an animal requires to release an amount of dissolved phosphorus equal to its total phosphorus content, referred to as the 'body-equivalent excretion time.' Research indicated that the ratio of oxygen consumed to phosphorus excreted decreases markedly with decreasing animal size. Lack of parallelism between these two physiological processes deserves investigation. In marine animals the rate of excretion of dissolved phosphorus per unit weight increases as body weight decreases. Consequently microzooplankton may play a major role in planktonic nutrient regeneration. (Jones-Wisconsin)

EFFECTS OF ACID MINE WASTES ON PHYTOPLANKTON IN NORTHERN ONTARIO LAKES,
Ontario Water Resources Commission, Toronto. Div. of Research.
M. G. Johnson, M. F. P. Michalski, and A. E. Christie.
Ontario Water Resources Commission, Division of Research Publication No 30, (1968). 44 p, 6 fig, 5 tab, 15 ref, append A, B, C.

Descriptors: *Algae, *Analytical techniques, *Aquatic algae, Aquatic microbiology, Aquatic microorganisms, Aquatic plants, Aquatic productivity, Balance of nature, Bioassay, Chlorophyta, Cyanophyta, Diatoms, Environmental effects, Essential nutrients, Eutrophication, Bicarbonates, Carbon, Carbonates, Carbon cycle.
Identifiers: *Acid mine water, *Nutrient requirements, *Pollutants, Inhibition, Limnology, Acidity, Acid soils, Acidic water, Acids, Photosynthesis, Photosynthetic oxygen, Physiological ecology, Phytoplankton, Plankton, Pollution abatement, Pollutant identification, Water pollution control, Water pollution effects, Water pollution sources.

Studies were carried out during 1965 through 1967 on three northern Ontario lakes; two (Quirke and Pecors Lakes) were contaminated by quantities of free mineral acidity from uranium milling wastes and one (Dunlop Lake) was unaffected. Differences in chemical composition in the affected lakes, including low pH values and increased concentrations of sulfate ion, nitrate ion, and calcium ion were directly related to processes for the extraction of uranium and subsequent treatment of wastes. Nitrates were in greater supply in the contaminated lakes than in Dunlop Lake, while phosphorus and silica occurred in similar concentrations in all three lakes. Lower phytoplankton populations and indices of diversity were found in Quirke and Pecors Lakes than in Dunlop. Average primary productivities in the three lakes were 126, 71 and 34 milligrams carbon/square meter per day, respectively. In situ areal and volumetric measurements in laboratory and field bioassays confirmed the importance of inorganic carbon in limiting primary productivity. Authors concluded that inorganic carbon limits primary productivity in the lakes contaminated by acid mine wastes. However, they did not separate the effects of reduced pH alone from the effects of reduced inorganic carbon in arriving at that conclusion. (Fitzgerald-Wisconsin)

SOME EFFECTS OF CURRENT VELOCITY ON PERIPHYTON COMMUNITIES IN LABORATORY STREAMS,
Oregon State Univ., Corvallis. Dept. of Botany.
C. David McIntire.
Hydrobiologia, Vol 27, No 3-4, p 559-570, 1966. 4 fig, 11 ref.

Descriptors: *Currents (Water), *Velocity, *Periphyton, *Laboratories, *Streams, *Ecosystems, Biomass, Diatoms, Organic matter, Chlorophyll, Standing crop, Export, Productivity, Protozoa, Cyanophyta, Chlorophyta, Chrysophyta, Aquatic insects, Water pollution effects.
Identifiers: Substrate, Stigeoclonium, Oedogonium, Tribonema, Colonization rate, Achnanthes lanceolata, Navicula, Synedra ulna, Melosira varians, Phormidium tenue, Anabaena, Cocconeis placentula, Rhoicosphenia curvata, Ciliates, Baetis, Chironomus.

Some effects of current at velocities of 9 and 38 centimeters/second, on periphyton communities as determined in laboratory streams, are described. The communities, developing on the substrate, were seeded naturally by organisms entering through the water supply. The colonization proceeded in the following order: small diatoms, large diatoms, cyanophytes, ciliates, and finally chlorophytes, the last only in the slower stream. The diatom community developing in the faster current formed a dense, felt-like growth on the gravel and rubble substrate, and usually appeared dark green or brownish. At the slower current velocity, the community was dominated by species of Stigeoclonium, Oedogonium, and Tribonema, forming long, loose oscillating filaments on the substrate and resembling aggregations of green filamentous algae, often observed in ponds. Although accumulation of biomass on the gravel and rubble was much more rapid in the fast current than slow current, organic matter per unit area of substrate was approximately equal at both velocities at conclusion of the experiment. The export of biomass was consistently greater from the community subjected to the faster current, and at biomasses nearly constant or at steady state, the highest productivity was maintained at the faster velocity. NUTRIENT-PHYTOPLANKTON RELATIONSHIPS IN EIGHT SOUTHERN ONTARIO LAKES,
Ontario Water Resources Commission, Toronto. Div. of Research.
A. E. Christie.
Ontario Water Resources Commission, Div of Research Publication No 32, Oct 1968. 37 p, 10 fig, 7 tab, 23 ref.

Descriptors: *Algae, *Phytoplankton, *Nutrients, *Phosphorus, *Nitrogen, *Alkalinity, Lakes, Productivity, Phytoplankton.
Identifiers: *Ontario, *Canada, Kushog Lake (Ontario), Twelve Mile Lake (Ontario), Gull Lake (Ontario), Balsam Lake (Ontario), Sturgeon Lake (Ontario), Buckhorn Lake (Ontario), Clear Lake (Ontario), Rice Lake (Ontario).

A chain of eight southern Ontario lakes was sampled from April to September 1967, approximately every two weeks, to depths commensurate with the phototrophic zone. Each lake was sampled at two sites. Analysis of all samples included suspended and dissolved solids; total alkalinity; pH; nitrate, ammonia, organic nitrogen; ortho and acid hydrolizable (standard method's 'Total') phosphorus; algal genera (reported as areal standard units); and chlorophyll a. A few samples were analyzed for calcium, magnesium, iron, sodium, potassium, sulfate, and chlorine. One laboratory growth study on a single sample was reported where glucose, sodium bicarbonate, and a combination of the two was added to flasks containing an 'oligotrophic' lake water sample. Based on this single laboratory experiment and a positive correlation between alkalinity and algal standing crops in the other lake water samples, it was concluded that the upper relatively oligotrophic lakes contained adequate nitrogen and phosphorus, but could support greater algal crops if additional inorganic or biodegradable organic carbon were supplied. In the lower lakes the carbon was concluded to be in ample supply. It was concluded further that entry of nitrogen and phosphorus into all eight lakes should be controlled in the future. THE OBLITERATION OF THE HYPOLIMNION,
Yale Univ., New Haven, Conn. Osborn Zoological Lab.
Edward S. Deevey, Jr.
Memorie Istituto Italiano di Idrobiologia, Suppl 8, p 39-62, 1955. 5 fig, 30 ref.

Descriptors: *Lakes, *Hypolimnion, *Eutrophication, Volume, Stratigraphy, Iron, Oxygen, Phosphorus, Oligotrophy, Sedimentation, Productivity, Diagenesis, Glaciation, Paleolimnology, Lakes, Organic matter, Climatology, History, Bathymetry, Zooplankton, Deciduous forests, Depth, Silica, Ecology, Epilimnion, Carbon radioisotopes, Pollen, Water pollution effects, Hypolimnetic oxygen deficits.
Identifiers: Morphometry, Linsley Pond (Conn), Lake Windermere (England), Biocoenosis, Tanytarsus, Chironomus, Ontogeny, Chaoborus, Cladocera, Bosmina, Allometry, Pine-pollen, Grosser Ploener See (East Holstein), Tippecanoe Lake (Ind), Winona Lake (Ind), Green Lake (Wis).

Eutrophication consists of real increases in biologic productivity, conditioned by increasingly favorable climatic and nutrient conditions in early postglacial time, and halted at equilibrium levels appropriate to climatic and geochemcial ecological requirements. The distinction between true (edaphic) and apparent (morphometric) trophic status is examined, and implications that morphometry of lakes changes automatically as sedimentation proceeds are considered. Ontogeny of Linsley Pond (Connecticut) and of lakes generally, showing characteristics of increasing eutrophication is considered. Quantity of organic matter produced (judging by free quantities in sediments) was sigmoid up to an equipibrium level, as determined geochemically. The process apparently implies eutrophication, although lakes deep and large initially, simply become less oligotrophic, whereas Linsley Pond in reaching its present state of eutrophication, passed through stages characterized by the following midge faunas. Tanytarsus to Chironomus to Chironomus-Chaoborus. This hypothesis would be invalidated of its theoretical significance if it could be shown that eutrophication was an automatic consequence of sedimental filling and in this connection, classification of lakes by chironomid fauna is uncertain. Also compared, on basis of this hypothesis, is the rate of generation of oxygen deficits (per unit area) and then volumetric estimates for Linsley Pond, Lake Windermere, and Grosser Ploener See. EUTROPHICATION AND SENESCENCE IN A GROUP OF PRAIRIE-PARKLAND LAKES IN ALBERTA, CANADA,
Joseph Kerekes, and J. R. Nursall
International Association of Theoretical and Applied Limnology, Proceedings, Vol 16, p 65-73, 1966. 4 fig, 4 tab, 9 ref.

Descriptors: *Eutrophication, *Lakes, Hypsometric analysis, Temperature, Depth, Dissolved solids, Alkalinity, Dissolved oxygen, Benthic fauna, Oligochaetes, Plankton, Seston, Weight, Organic matter, Biomass, Surface waters, Productivity, Chemical properties, Nutrients, Volume, Turbidity, Ice, Evaporation, Hydrogen sulfide, Salinity, Water pollution effects, Diptera, Midges.
Identifiers: *Senescence, *Alberta (Canada), Morphometry, Hirudinea, Sphaeriidae, Lake area, Shoreline development, Cooking Lake (Alberta), Ninistik Lake (Alberta), Miquelon Lake (Alberta), Hasting Lake (Alberta), Antler Lake (Alberta), Seasonal effects, Canada.

Five lakes near Edmonton (Alberta), showing advanced eutrophication, are described. In lakes with separate basins, there exists definite correlation between biomass and morphometric factors. This suggests that, other factors being approximately equal, productivity is higher, if total dissolved solids (TDS) is higher, if mean depth is less, or if ratio of shoreline to area is higher. Standing stock of seston during summer in Cooking Lake is perhaps close to the maximum possible in a lake in north temperate zone under natural conditions. Its continuous algal bloom gives appearance of pea soup, and conditions are probably nearly optimal for producing a high standing stock of seston and factors influencing productivity are in 'harmony' in the meaning suggested by Rawson. TDS and alkalinity have ideal concentrations for development of plankton; the lake is large, shallow, and exposed to wind action. Remineralization of plankton is

rapid; nutrients are returned from sediments by mixing. Essential trace elements are probably present. Long daylight hours provide excellent conditions for intensive production. Based on this study, optimal TDS and alkalinity are about 1400 and 450 parts per million, respectively. (Jones-Wisconsin)

OBJECTIONABLE ALGAE WITH REFERENCE TO THE KILLING OF FISH AND OTHER ANIMALS,
Michigan State Univ., East Lansing. Dept. of Botany and Plant Pathology.
G. W. Prescott.
Hydrobiologia, Vol 1, p 1-13, 1948. 6 tab, 14 ref.

Descriptors: *Nuisance algae, *Eutrophication, Cyanophyta, Lakes, Reservoirs, Scum, Nitrogen, Phosphorus, Carbonates, Temperature, Shallow water, Hydrogen sulfide, Copper sulfate, Chlorophyta, Crustaceans, Soil erosion, Sewage effluents, Farm wastes. Population, Industries, Methane, Alkalinity, Hydrogen ion concentration, Toxins, Oxygen, Decomposing organic matter, Water pollution effects, Photosynthesis, Iowa, Chlorine.
Identifiers: Hydroxylamine, Anabaena, Microcystis, Gloeotrichia echinulata, Dinobryon, Synura uvella, Fragilaria, Tabellaria, Melosira, Synedra, Coelosphaerium, Spirogyra, Cladophora, Diaptomus, Cyclops, Gomphonema, Phormidium, Aphanizomenon flos-aquae, Lynghya, Storm Lake (Iowa), Center Lake (Iowa), Diamond Lake (Iowa).

Most troublesome algae in lakes and reservoirs are species of cyanophytes (blue-green algae), which multiply rapidly and tend to float high in the water, forming surface scums. Upon decomposition, malodorous gases and disagreeable tastes are produced. Critical conditions arising from a superabundant growth of algae occur in lakes which are shallow, warm, and rich in nitrogen, phosphorus, and half-bound carbonates. Dense 'blooms' are particularly annoying and often cause economic loss by ruining recreational sites, spoiling drinking water, clogging sand filters, killing fish (directly or indirectly), and killing animals which drink the heavily infested waters. Experiments indicate that fish may be poisoned by products of protein decomposition, including hydroxylamine and hydrogen sulfide, which are released when dense masses of cyanophytes decay. Factors which should be taken into consideration for effective treatment of lakes with copper sulphate are listed. Advantages of applying copper sulphate by spray method are pointed out. A laboratory experiment to test the algicidal action of copper is described. Data indicate that fish can withstand much greater concentrations of copper sulphate than those needed to control algae. (Jones-Wisconsin)

MINERAL NUTRITION OF PHYTOPLANKTON,
Woods Hole Oceanographic Institution, Mass.
Bostwick H. Ketchum.
Annual Review of Plant Physiology, Vol 5, p 55-74, 1954. 2 tab, 126 ref.

Descriptors: *Phytoplankton, *Nutrient requirements, Ecology, Chlorella, Algae, Organic matter, Cultures, Carbon, Metabolism, Nitrogen, Phosphorus, Sulfur, Calcium, Magnesium, Potassium, Sodium, Iron, Manganese, Trace elements, Chelation, Photosynthesis, Carbon dioxide, Bicarbonates, Carbonates, Temperature, Hydrogen ion concentration, Alkalinity, Light intensity, Cyanophyta, Ions, Ammonia, Nitrates, Nitrites, Dinoflagellates, Chlorophyta, Humic acids.
Identifiers: Heterotrophic, Chemotrophic, Autotrophic, Silicon, Pediastrum boryanum, Staurastrum paradoxum, Botryoccus Braunii, Fragilaria crotonensis, Nitzschia, Asterionella gracillima, Growth factors.

Phytoplankton nutrition was studied for understanding ecological conditions for growth. Use of algal organic material as a possible food source has stimulated extensive studies of mass cultures. For comparisons of results, nutrient requirements are defined as: absolute, normal, minimum, and optimum concentrations. Optimum concentration will permit maximum growth rate, reproduction, or photosynthesis of algal populations. This is based upon the concept that an inadequate concentration may result in decreased assimilation rate and an excessive concentration may be inhibitory or toxic. Pure, or at least, unialgal cultures, are needed for this study. Most nutritional investigations have been made on algae species easy to culture which perhaps differ in nutrition and physiology from those difficult to culture. Major absolute requirements include carbon, nitrogen, phosphorus, sulphur, potassium, and magnesium; iron and manganese are required in smaller amounts, sodium is unessential and calcium requirement is contradictory. Silicon is a major requirement for diatom growth but unnecessary for other forms. Various other elements--zinc, boron, cobalt, molybdenum, and copper may be necessary as trace elements. Normal requirements of various algae are given for carbon, nitrogen, phosphorus, under certain conditions. (Jones-Wisconsin)

STABILIZATION OF AN ACTIVATED SLUDGE PLANT,
Consoer, Townsend and Associates, Chicago, Ill..
Carl D. Wright.
Water Wastes Engr, Vol 6, No 6, p 34-36, June 1969. 2 fig, 4 tab.

Descriptors: *Activated sludge, *Design data, Efficiency, Biochemical oxygen demand, Costs.
Identifiers: *Plant upset, *Shock loads, Plant modification, Kraus process, Pleasant Hills (Pa), Sludge volume index, Return activated sludge, Waste activated sludge, Clarifiers.

An activated sludge plant (3 mdg) in Pleasant Hills, Pa., operated satisfactorily for several years then became unstable or upset. It was speculated that shock loads caused by shopping centers, motels, and home garbage grinders might be responsible. The plant was converted to the Kraus process with separate aeration of return activated sludge combined with waste digester supernatant and digested sludge solids. The digested sludge solids are converted to an extremely low index activated sludge and the ammonia nitrogen returned in the digester liquor is partially converted to nitrate. This material is introduced to the aeration tanks. The process achieves complete stabilization under shock loads. The plant was modified early in 1968 and has operated satisfactorily since that time. The cost of converting the plant was about $15,000 total. (Ledbetter-Texas)

FACTOR ANALYSIS AS AN AID IN AN ECOLOGICAL STUDY OF ANAEROBIC DIGESTION,
National Inst. for Water Research, Pretoria (South Africa).
D. F. Toerien, W. H. J. Hattingh, J. P. Kotze, P. C. Thiel, and M. L. Siebert.
Water Research (J Int Assn on Wat Poll Res), Vol 3, No 2, p 129-140, Feb 1969. 2 fig, 2 tab, 13 ref.

Descriptors: *Anaerobic digestion, Aerobic bacteria.
Identifiers: *Ecological study, *Factor analysis, Eigen-values, Eigen-vectors, Matrix, Dehydrogenase enzymes, Kinase enzyme, Biotic, Abiotic.

Interrelations between characteristics of an anaerobic ecosystem by means of principal component analysis of the linear correlation coefficient matrix of these characteristics is determined and described. Principal components (factors) were obtained which presented varied characteristics of the ecosystem. The behavior of the factors during a stress period was graphically demonstrated in relation to time. A three-dimensional model yielded visual representation of the behavior of three arbitrary chosen factors in relation to one anoter. It was concluded that factor analysis contributes much towards the determination of the relationships between characteristics and condenses the multitude of test correlations of the ecosystem into interpretable factors. THE EFFECT OF METHANE ANALOGUES ON METHANOGENESIS IN ANAEROBIC DIGESTION,
National Inst. for Water Research, Pretoria (South Africa).
P. G. Thiel.
Water Research (J Int Assn on Wat Pol Res), Vol 3, No 3, p 215-223, Mar 1969. 4 fig, 15 ref

Descriptors: *Anaerobic digestion, *Inhibition, Hydrogen, Carbon dioxide, Gas chromatograph.
Identifiers: *Toxic substances, *Methanogenesis, Chloroform, Carbon tetrachloride, Methylene chloride, Methane analogues, Warburg flasks, Endogenous methane, Inhibitors.

Extremely low concentrations of chloroform, carbon tetrachloride, and methylene chloride can inhibit methanogenesis in anaerobic digestion. This study was prompted by similar inhibition on rumen microbiota. Along with inhibition of methanogenesis, an accumulation of hydrogen was seen. The inhibition of methanogenesis by 50% from 0.96 mg/l of chloroform, 2.2 mg/l of carbon tetrachloride, or 100 mg/l of methylene chloride may have a bearing on digester operation. The results of this study were compared with those on rumen and the possible role of extracellular hydrogen as an intermediate in anaerobic digestion was discussed. (Ledbetter-Texas)

PHOSPHATE REMOVAL AT FORT WORTH, TEXAS.
Federal Water Pollution Control Administration, Ada, Okla.
J. A. Horn, B. L. DePrater, and J. L. Witherow.
Water Wastes Engr, Vol, No 7, p 40-42, July 1969. 4 fig, 5 tab, 2 ref.

Descriptors: *Activated sludge, *Aeration, Design data, Dissolved oxygen, Municipal waste.
Identifiers: *Phosphate removal, *Operating data, Orthophosphates, Detention times.

The high removal of phosphates by a 30 mgd municipal waste treatment plant using activated sludge process is described. The article presents the design and operating data for the plant. Total phosphate removal for the plant averaged 84 percent. The plant has many similarities to the Rilling Plant in San Antonio, Texas, which reported high phosphate removals; however, there are several significant differences between the two plants. The marked differences are the following: (with Ft. Worth data first then the corresponding Rilling data in parentheses) primary effluent BOD in mg/l- 260 (180); sludge age in days-12 (3.2); SVI in mg/l- 258 (155); BOD loading in lb/day/lb of MLSS+ reaerated suspended solids-0.15 (0.43); BOD loading in lb/day/lb MLSS 0.35 (0.43); and phosphate removal in % - 74 (80). Because both plants obtain high phosphorus removal, the inclusion of reaerated and the differences in sludge age

and BOD loading and concentrations are concluded to be within the limits of design and operation for high phosphate removal. (Ledbetter-Texas)

THE METHANE FERMENTATION BETWEEN MESOPHILIC AND THERMOPHILIC TEMPERATURE RANGES,
California Univ., Davis. Dept. of Civil Engineering.
David J. Hills, and Edward D. Schroeder.
Water Wastes Engr, Vol 6, No 7, p 46-49, July 1969. 5 fig, 1 tab, 13 ref.

Descriptors: *Anaerobic digestion, *Digestion, *Sludge digestion, Model studies, Alkalinity.
Identifiers: *Methane fermentation, *Anaerobic fermentation, Laboratory models, Gas production, Volatile acids, Methane production, Mesophilic bacteria, Optimum temperature.

Raw sludge was screened and rapidly frozen to -30 deg C, then warmed as needed and fed to three 5 gal carboys used as digesters. The digesters had been seeded with mesophilic bacteria. The temperature was raised incrementally from 35 deg to 52 deg C while observing the gas production from methane fermentation. The detention period was 20 days for the digesters. The data obtained show the optimum growth temperature for mesophilic bacteria to be around 41 deg C while 42 deg C marks the upper boundary for growth. (Ledbetter-Texas)

Water Wastes Engr, Vol 6, No 5, p C.1-C.6, May 1969. 7 fig, 2 tab, 5 ref.

Descriptors: *Activated sludge, *Biological treatment, BOD, Industrial wastes, Municipal wastes, Dewatering, Design data.
Identifiers: *Secondary treatment, *Aero-accelator, Thickening, Vacuum filtration, Clarifiers, Comminution, Grit removal, Primary clarification, pH adjustment, Sludge volume index, MLSS, Operating performance, South Charleston (W Va).

A four year evaluation of the activated-sludge treatment of a combined petrochemical-municipal waste in full-scale aerator-clarifier units has been completed. Performance data indicate that the removal capacity of BOD-5 from the mainly petrochemical waste at an 80 percent efficiency reaches 180 lb per day per 1000 cu ft of aeration volume. An average BOD-5 removal of 130 lb per day per 1000 cu ft was obtained. A concentration of 500 mg per L of highly active biological solids could be maintained to accomodate wide variation in wastewater strength and constituents. The effects of detention time, organic loading, and sludge age on performance were delineated. Unit modifications increased the standard oxygen-transfer efficiency to 25 percent, and operating guides were established to push the units to maximum capacity while minimizing shock effects. WESTERN ELECTRIC BUILDS MODERN PLANT FOR TREATING METAL FINISHING WASTES,
Western Electric Co., Inc., Indianapolis, Ind.
S. F. O'Connor, B. W. Mountjoy, Jr., and N. S. Chamberlin
Water Wastes Engr, Vol 6, No 7, p D.16-D.19, July 1969. 5 fig, 1 tab

Descriptors: *Industrial wastes, *Copper, *Gold, Neutralization, Oxidation, Reduction.
Identifiers: *Metal plating wastes, Cyanates, Hexavalent chromium, Acid-alkali wastes, Segregation of wastes, Tin, Nickel, Silver, Zinc, Sludge dewatering, Operating experience, Oxidation-reduction potential, pH adjustment, Solids removal.

The waste treatment scheme adopted for the metal finishing wastes at the Indianapolis plant of Western Electric is described. The plant variously employs neutralization, oxidation, reduction, solids removal, and solids dewatering. The wastes come mostly from the plating shop and include rinse waters from anodizing, bright-dipping, case-hardening, chromating, cleaning, electroplating, and phosphating. Besides the metals from the plating operations (chromium, copper, gold, nickel, silver, tin, and zinc), the wastes include frequent dumps of spent acid, alkali, and cyanide baths used in the plating operations. Operating results have been excellent with the exception of the segregation of the wastes. This problem will be resolved with time. (Ledbetter-Texas)

THE PROTEOLYTIC BACTERIA PRESENT IN THE ANAEROBIC DIGESTION OF RAW SEWAGE SLUDGE,
National Inst. for Water Research, Pretoria (South Africa).
M. L. Siebert, and D. F. Toerien.
Water Research (J Int Assn on Wat Poll Res), Vol 3, No 4, p 241-250, Apr 1969. 9 tab, 17 ref.

Descriptors: *Anaerobic digestion, Isolates, Protein, Fermentation, Nitrogen-hydrogen, Ureas, Reduction of nitrate, Cellulose, Carbohydrates.
Identifiers: *Raw sludge, *Proteolytic bacteria, Identification, Bacteria typing, Sporeforming, Cocci, Media, Clostridia, Rod-shaped, Bergey's Manual, Liquefaction, Citrate, Albumin.

The occurrence and identity of proteolytic bacteria in the anaerobic digestion of raw sewage sludge were investigated. Proteolytic bacteria occurred in numbers of 65 x 10 to the sixth power/ml. A high proportion of the isolates (65%) was sporeforming bacteria, and included seven Clostridium species. Cocci comprised 21% of the isolates and consisted mainly of Peptococcus anaerobius and one isolate of Staphylococcus aureus. The remaining isolates were non-sporeforming rod-shaped bacteria and included bifid-like bacteria, Bacteroides species and Eubacterium species. (Ledbetter-Texas)

ANAEROBIC DIGESTION: I. THE MICROBIOLOGY OF ANAEROBIC DIGESTION (Review paper),
National Inst. for Water Research, Pretoria (South Africa).
D. F. Toerien, and W. H. J. Hattingh.
Water Research (J Int Assn of Wat Poll Res), Vol 3, No 6, p 385-416, June 1969. 4 fig, 4 tab, 139 ref.

Descriptors: *Anaerobic, *Digestion, *Hydrolysis, Review methane, Carbon dioxide, Microbiology, Metabolism, Respiration, Fermentation.
Identifiers: *Liquefaction, *Gasification, Methanogenic bacteria, Fatty acids, Pathways, Nutrition, Bacterial population.

Anaerobic digestion is defined as a biological process which converts organic matter to methane and carbon dioxide in the absence of oxygen. Anaerobic digestion is considered as a two-step process, acid formation (liquefaction) and gas formation (gasification). Two large, different bacterial populations must be present to reach the end point--the first group converts proteins, carbohydrates, and lipids into fatty acids by hydrolysis and fermentation and the second group converts the fatty acids into methane and carbon dioxide. Article is a review of research done on these two stages of anaerobic degradation with emphasis on bacterial populations and their nutritional and oxygen requirements. The metabolic and catabolic products along with the pathways of formation are delineated as far as is known. (Ledbetter-Texas)

NITROGEN RELATIONSHIPS IN BIOLOGICAL TREATMENT PROCESSES--II. NITRIFICATION IN TRICKLING FILTERS,
Texas Univ., Austin. Environmental Health Engineering Research Lab.
S. Balakrishnan, and W. W. Eckenfelder, Jr.
Water Research (J Int Assn on Wat Poll Res), Vol 3, No 2, p 167-174, Feb 1969. 7 fig, 2 tab, 9 ref.

Descriptors: *Nitrification, *Trickling filter, Ammonia.
Identifiers: *Raschig rings, *Berle saddles, *Specific surface, Hydraulic loading, Acclimation, Organic nitrogen.

A laboratory model trickling filter was used to study the amount of nitrification obtained. The filter had a 6-foot depth of packing with 1-inch Raschig rings and Berl saddles that were hand-packed in the ratio of 2:3. The equation used to represent the percent nitrification was first order with respect to depth but higher order for hydraulic loading. The 2 parameters of fit were derived from the data collected. An increase from 10 MGAD to 30 MGAD caused the percent nitrification to decrease from 72 to 52. A linear relation was found between the rate constant and the specific surface. Temperature is said to have a great influence on the amount of nitrification. (Ledbetter-Texas)

ENGINEERING ASPECTS OF WASTEWATER CONTRACTS,
Gannett, Fleming, Corddry, and Carpenter, Inc., Harrisburg, Pa.
S. I. Zack.
J Sanit Eng Div, Proc Amer Soc Civil Eng, Vol 95, No SA3, Proc Paper 6602, p 465-480, June 1969.

Descriptors: *Contracts, *Financing, *Maintenance, *Management, *Sanitary engineering, Construction, Operation.
Identifiers: Expenses, Consultants, Disputes, Litigation, Ordinances, Sewage service.

The engineering elements essential to the financing, construction, operation and maintenance of sewerage facilities for use by two or more parties are outlined. Among subjects covered are contract terms, conditions, and clauses in successful use which include engineering basis for jointly sharing the capacities of sewage collection and treatment facilities; and for jointly sharing of capital and annual operating and maintenance costs; and also definitions of engineering terms, regulations pertaining to conditions of wastewaters, both domestic and industrial, acceptable from the party being served, as well as how and when payments are made according to actual contracts in effect are given. The importance of scheduling payments to meet commitments are indicated and examples are cited to show how engineering factors and needs of a specific location affect the patterns of a contract. The article emphasizes that no lawyer should endeavor to write a contract without engineering consultation and that no engineer should write a contract without legal advice. (Ledbetter-Texas)

TREATMENT OF KRAFT MILL WASTES WITH A PLASTIC MEDIA TRICKLING FILTER,
Mississippi State Univ., State College; and International Paper Co., Mobile, Ala. Southern Kraft Div.
E. J. Middlebrooks, and Frank J. Coogan.
Water Research (J Int Assn on Wat Pol Res), Vol 3, No 3, p 203-214, Mar 1969. 11 fig, 2 tab, 12 ref.

Descriptors: *Trickling filter.
Identifiers: *Plastic media, *Kraft waste, *Mesophilic-thermophilic, Supplemental nutrients, Diammonium phosphate, Sodium nitrate, Anhydrous ammonia, Clarifier, Preformed filter media, Surfpac, BOD removal, COD removal, Toxic substances, pH, Kills.

A pilot plant trickling filter with preformed plastic media (Dow Chemical's Surfpac) was used to

determine operating conditions for treating a kraft wastewater. Performance was found to be satisfactory at temperatures of 45-50 deg C. The filter plus secondary settling removed more than 60% of BOD applied (neglecting recycle) at 3.7 gpm/ft sq of primary clarifier effluent with 2.0 gpm/ft sq recycle. Overall treatment removed 70% of BOD. Diammonium phosphate and sodium nitrate were used as supplemental nutrients. Sufficient phosphorous in water; therefore, anhydrous ammonia most economical supplement. (Ledbetter-Texas)
W70-02606

NITROGEN RELATIONSHIPS IN BIOLOGICAL TREATMENT PROCESSES--III. DENITRIFICATION IN THE MODIFIED ACTIVATED SLUDGE PROCESS,
Texas Univ., Austin. Environmental Health Engineering Research Lab.
S. Balakrishman, and W. W. Eckenfelder.
Water Research (J Int Assn on Wat Pol Res), Vol 3, No 3, p 177-188, Mar 1969. 13 fig, 3 tab, 15 ref.

Descriptors: *Denitrification, *Nitrogen, *Nitrates, Oxygen, Carbon, Trickling filter, Activated sludge.
Identifiers: Microbial denitrification, TOC, MLSS, Contact-stabilization-denitrification, Batch flow, Continuous flow, Anaerobic, COD.

A laboratory model of modified activated sludge units under both batch and continuous feed conditions was used to study the denitrification of wastewater. The separated sludge is held under anaerobic conditions to require the bacteria to use the oxygen from nitrates and accomplish denitrification. Rate of denitrification increased as the organic matter by TOC increased. Higher denitrification rates accompanied higher nitrate concentrations in the sludge. The presence of oxygen at a level of 6.0 mg/l prevents denitrification. A 4-hr detention at 25 deg C removes 80-90% of the total nitrogen. The process used is 'Contact-Stabilization-Denitrification.' (Ledbetter-Texas)

ANALOG SIMULATION OF ACTIVATED SLUDGE SYSTEMS,
Kentucky Univ., Lexington.
Carl E. Burkhead, and D. J. Wood.
J of Sanit Eng Div, Proc Amer Soc Civil Eng, Vol 95, No SA3, Proc Paper 6631, p 593-606, June 1969. 14 fig, 1 tab, 7 ref.

Descriptors: *Analog computers, *Sanitary engineering, *Sludge treatment, Design, Operation.
Identifiers: *Activated sludge process, Steady state, Transient.

Analog computer solutions of activated sludge design equations are presented for constant, shock, and periodic feed input conditions. From system responses of the aerated lagoon, extended aeration, and separate sludge wasting activated sludge systems to these different inputs, the authors draw the following conclusions: (1) the analog computer can be used to solve nonlinear differential equations for both steady-state and transient solutions; (2) operational changes caused by different plant influents, e.g., shock and periodic loads, and response comparisons of different activated sludge systems to such inputs can be determined using the analog computer; and (3) research is necessary to confirm the ability of present design expressions to describe transient changes in actual plants. DESIGN PRINCIPLES OF WASTE STABILIZATION PONDS,
Nova Scotia Technical Coll., Halifax.
D. Thirumurthi.
J Sanit Eng Div, Proc Amer Soc Civil Eng, Vol 95, No SA2, Proc Paper 6515, p 311-330, Apr 1969. 8 fig, 6 tab, 22 ref.

Descriptors: *Algae, *Dispersions, *Environmental engineering, *Sanitary engineering, *Sewage treatment, *Tracers, *Water pollution, Design, Design criteria, Oxidation lagoons photosynthesis.
Identifiers: *Model tests, Dyes.

Waste stabilization ponds will be more effectively employed as pollution control systems if suitable design formula and corresponding design parameters are made available to design engineers. To accomplish this objective, an analogy has been drawn between a first-order chemical reactor and a waste stabilization pond. This analogy has resulted in the adaptation of a chemical engineering reactor design equation for designing stabilization ponds. Two design parameters, first-order BOD removal coefficient and dispersion index, were considered as the basis of the new design approach. Synthetic sewage was used to determine the BOD removal kinetics. A control pond, with tap water as the medium and sodium chloride as a tracer, was used to calculate the dispersion index. The interpretation of the results demonstrate the successful applicability of the proposed design formula. An example design problem has been worked out. (Ledbetter-Texas)

KINETICS AND EFFLUENT QUALITY IN EXTENDED AERATION,
California Univ., Berkeley. Sanitary Engineering Research Lab.
E. J. Middlebrooks, D. Jenkins, R. C. Neal, and J. L. Phillips.
Water Research (J Int Assn on Wat Pol Res), Vol 3, No 1, p 39-46, Jan 1969. 5 fig, 1 tab, 23 ref.

Descriptors: *Activated sludge, *Denitrification.
Identifiers: *Extended aeration, *Package plant, 'Comminutor, *Oxigest, Hypochlorinator sludge accumulation, VSS, ML.VSS, COD, Suspended solids, Nitrogen pathways, Polysaccharide substrate removal, Cell yield.

A plant study is reported of an extended aeration package type plant (Oxigest). During the four-month period, the substrate removal rate averaged 0.09 lb COD/lb VSS-day (median 0.06). Influent COD's ranged from 160 to 2300 mg/l and the ML.VSS declined steadily from 5110 to 1810 mg/l. Effluent quality remained about 16 plus or minus 8 mg/l. Suspended matter in the effluent ranged from 8 to 216 mg/l and averaged 25 mg/l (median 42 mg/l). A significant proportion of the soluble effluent COD and the activated sludge solids was a polysaccharide-like material. Nitrogen data indicated denitrification in the secondary settling tank. EXPERIMENTAL PROBLEMS ASSOCIATED WITH THE TESTING OF SURFACE AERATION EQUIPMENT,
Mixing Equipment Co., Rochester, N.Y.
G. G. Landberg, B. P. Graulich, and W. H. Kipple.
Water Research (J Int Assn on Wat Pol Res), Vol 3, No 6, p 445-455, June 1969. 3 fig, 1 tab, 6 ref.

Descriptors: *Oxygenation, *Aeration, *Reaeration, *Mass transfer, Saturation, Bubbles, Dissolved oxygen.
Identifiers: *Reaeration rate, *Surface aerators, Mass transfer coefficient, Steady state, Reaeration curve, Cobalt ion, Sulfite, Standard saturation, Aerators.

The pitfalls are described in using a first order differential equation to represent the rate of oxygenation (dc/dt) in the determination of the overall mass transfer coefficient K-sub L a. Three regimes prevail in plot of c*-c (log scale) vs time; namely, time of up to 30 min or more for a hydraulic steady state to obtain, during which the slope is too flat; portion where straight line fit approximates the plot very well, where slope is K-sub L a and the steepening part of the plot as c nears c*. Two states of oxygen exist during aeration--finely divided bubbles and truly dissolved oxygen. K-sub L a varies with temperature of water and air, humidity, wind velocity, and sulfate concentration. It is proposed to change base for temperature correction from 1.024 to 1.012. For accuracies of plus or minus 5% in performance, a minimum of 6 tests under varying conditions is required. This accuracy is needed for comparing aerators. (Ledbetter-Texas)

ENERGY CONCEPTS OF AEROBIC MICROBIAL METABOLISM,
Kentucky Univ., Lexington.
Carl E. Burkhead, and Ross E. McKinney.
J Sanit Eng Div, Proc Amer Soc Civil Eng, Vol 95, No SA2, Proc Paper 6505, p 253-268, Apr 1969. 4 fig, 7 tab, 17 ref.

Descriptors: 'Activated sludge, 'Energy, 'Metabolism, Microbiology, Sanitary engineering, Enthalpy, Free energy, Thermodynamics.
Identifiers: 'Aerobic processes, 'Cell yield, Cells (Biology), Substrates

The authors investigated three different energy concepts of cell yield using synthesis data measured in mixed aerobic cultures for 15 different substrates, including, the energy-synthesis concepts of McKinney, Servizi and Bogan, and McCarty. Growth, substrate removal, and oxygen uptake measurements at 25 deg C are correlated with various thermodynamic functions including enthalpy and free energy. Efficiency measurements based upon free energy computations agree with McCarty's results. The study results, however, conflict with the magnitude of cell yield per unit change of free energy of oxidation as estimated by Servizi and Bogan. Conclusions regarding the validity of McKinney's heat loss-cell yield relationship were not possible although the proportionality between heat of reaction and oxygen utilization was verified. This latter relationship is based upon hypothetical oxidative assimilation equations computed from the experimental data and assumed protoplasm formulations. Substrates used in the study included compounds representing the basic food substances of carbohydrates, fatty and amino acids. (Ledbetter-Texas)

THE EFFECTS OF RADIATION ON CHICAGO METROPOLITAN SANITARY DISTRICT MUNICIPAL AND INDUSTRIAL WASTES,
Battelle-Northwest, Richland, Wash. Pacific Northwest Lab.; and Metropolitan Sanitary District of Greater Chicago, Ill.
C. J. Touhill, E. C. Martin, J. E. Stein, and G. McDonnell.
J Water Pollut Contr Federation, Vol 41, No 2, Part 2, p R44-R60, Feb 1969. 14 fig, 2 tab, 5 ref.

Descriptors: *Radioactivity effects, *Effluent streams, *Municipal wastes, *Industrial wastes, Phenols, E. coli, Spores, Coliforms, Bacteriophage.
Identifiers: *Cyanides, *Total counts, Chicago, Colloids, Dodecane, N-paraffins.

The effects of irradiation on cyanides, phenols, and petroleum-related components, and on the microbial populations of waste effluents, are described. They irradiated the wastes under both batch and continuous flow conditions. Cyanides in concentrations of 0.5 to 45 mg/l (as encountered by the Metropolitan Sanitary District) degraded into innocuous compounds when exposed to 174,000 r in 1 hr. A dose rate of 174,000 r/hr changed phenols to dark brown colloidal suspensions. A 99% conversion of a 1000 mg/l phenol solution required 20 hrs, but the 10 mg/l solution was 95% changed in 30 min. Petroleum-type wastes as simulated by dodecane and normal paraffinic hydrocarbons were rather resistant to radiation change. Organism kill curves showed that 250,000 rads caused the following kills: total counts, 99.995%; coliforms, 100%; enterococci, 100%; spores, 92%; and E. coli phages, 100%. (Ledbetter-Texas)

SLUDGE DISPOSAL EXPERIENCES AT NORTH LITTLE ROCK, ARKANSAS,
North Little Rock Sewer Dept., Ark.
Jimmie M. Alford.
J Water Pollut Contr Federation, Vol 41, No 2, Part 1, p 175-183, Feb 1969. 6 fig, 1 tab.

Descriptors: *Sludge disposal, *Centrifugation, *Incineration, Domestic wastes, Dewatering, Operation and maintenance.
Identifiers: *Autogenous combustion, *Centrifuge, *Primary sludge, Fluidized bed, Operating data.

The operating experience of a centrifugal dewatering and autogenous combustion sludge incinerator is described. Primary sludge is stored for 24 to 48 hours to bring solids to 9 to 10% with volatiles of 75 to 80%. Centrifuges (15 mch, 3600 rpm) dewater the sludge to from 32 to 35% solids. A fluidized sand bed incinerator, 9 ft dia, burns the sludge under autogenous combustion at 1100 deg F to 1500 deg F. The unit operates at a pressure of 5 psig and burns 1200 lb/hr of sludge cake with 1500 scfm of air. The air leaving the unit has 240 to 300 lb/hr of fly ash. Power consumption for dewatering and combustion is about 56 kw (75hp) for full load. (Ledbetter-Texas)

THE EFFECT OF ELEVATED TEMPERATURES ON THE TREATMENT OF NORMAL DOMESTIC SEWAGE,
Mississippi State Univ., State College. Dept. of Microbiology.
L. R. Brown, R. G. Tischer, C. M. Ladner, and C. D. Bostwick.
Mississippi State University Report, State College, Mississippi, July 1, 1967. 55 p, 6 tab, 26 fig. OWRR Project A-007-MISS.

Descriptors: *Temperature, *Domestic wastes, *Biochemical oxygen demand, *Chemical oxygen demand, *Biological treatment, Thermophilic bacteria, Waste water treatment, Aerobic treatment, E. coli, Pseudomonas.
Identifiers: Phosphate removal, Suspended solids.

The stabilization of normal domestic sewage at 30 deg C, 45 deg C, 55 deg C, and 65 deg C has been investigated, and it was found that suspended solids removal was essentially the same at all temperatures and averaged between 90 and 94% removal. BOD and COD removal decreased with increasing temperature, and COD removal ranged from as low as 49% at 65 deg to 70% at 30 deg. Settleable solids reduction for the 30 deg C and 65 deg C were 80% and 58%. Thermal death time studies have shown that E. coli and the enterococcus were killed within 30 minutes at 55 deg C and within 10 minutes at 65 deg C. S. paratyphi and shigella sonnei were destroyed within 14 minutes at 55 deg C and within 4 minutes at 65 deg C. There appears to be more organisms in normal domestic sewage which grow at 45 deg C than there are which grow at 55 deg C or at 65 deg C. The major objection to the effluent from the 55 deg C treatment was the turbidity caused by the bacterial population. It has been found that the treatment of the 55 deg C effluent with protozoa markedly decreases not only the turbidity of the effluent but also lowers the COD. (Upadhyaya-Vanderbilt)

DISCHARGE OF SEWAGE EFFLUENT FROM A LINE SOURCE INTO A STRATIFIED OCEAN,
California Inst. of Tech., Pasadena. Dept. of Civil Engineering.
Norman H. Brooks, and Robert C. Y. Koh.
International Association of Hydraulic Research, XI Congress, Leningrad, Sept 1965. 8 p, 3 fig.

Descriptors: *Sewage effluents, *Density stratification, *Oceans, Outlets, Buoyancy, Thermal pollution.
Identifiers: *Plumes.

The case of a two dimensional buoyant plume in a density stratified environment in which the density gradient is uniform is treated. The engineering practice sewage is often discharged into a long line of jets from ports along a straight diffuser pipe; after a brief period of mixing as circular jets, the individual discharges merge into a wide plume as if produced by a virtual two-dimensional source. When the ocean is density stratified, the buoyant plume of sewage may not rise to the ocean surface because the diluted sewage in the plume becomes neutrally buoyant at an intermediate level. The solution presented here presumes vertical upward discharge, and the effects of initial momentum flux and mass flux, as well as buoyancy flux, are considered. An analysis is given, following the method of Morton, for determining the maximum height of rise of a two-dimensional plume as a function of the buoyancy, mass, and momentum fluxes at the source, and the density gradient in the ocean (assumed constant). Mass and momentum flux parameters are found to be of secondary importance compared to the buoyancy flux and density gradient. The theory is briefly illustrated by application to the design of a sewer out-fall for Seattle, Washington. (Guerrero-Vanderbilt)

EFFECT OF BORON ON BIOLOGICAL WASTE TREATMENT,
Delaware Univ., Newark. Dept. of Civil Engineering.
Shankha K. Banerji
Project Completion Report, Sept 1969. 10 p, 3 tab, 1 fig, 3 ref. OWRR Project A-007-DEL.

Descriptors: *Boron, *Toxicity, *Biological treatment, Adsorption, Water quality, Sludge synthesis, Endogeneous respiration.
Identifiers: *Delaware

Water quality of waterways and wastewaters of Delaware were analyzed to determine the extent of boron in the environment. Generally, urban and semi-urban streams had higher boron levels compared to rural ones, indicating that boron may be a good tool to determine man-made pollution. Toxicity of boron in slug doses to aerobic biological waste treatment was determined by using laboratory batch activated sludge units fed with glucose and yeast extract. Using Michaelis-Menten enzyme inhibition model, it was found that the inhibition of boron to activated sludge was uncompetitive. Continuous boron dosing experiments showed that activated sludge cultures did not acclimate to boron after prolonged exposure and the corresponding toxicity of a particular boron dose was higher than that obtained in slug dose conditions. Toxicity of boron on microorganisms were manifested in respiration reactions more so than synthetic ones. Adsorption of boric acid on the clays, illite and kaolinite, and biological sludge was also determined. Significance of this adsorption lies in the fact that further concentration of the sludge after boron adsorption would increase the level of boron several fold, causing problems in subsequent operations, e.g., sludge digestion or land disposal of sludge.

DEEP WELL DISPOSAL OF WASTEWATERS IN SALINE AQUIFERS OF SOUTH FLORIDA,
J. I. Garcia-Bengochea, and R. O. Vernon.
Paper presented at 50th Annual Meeting, American Geophysical Union, Wash DC, Apr 21-25, 1969. 15 p, 4 plate, 1 tab, 7 ref.

Descriptors: *Injection wells, *Deep wells, *Waste water disposal, *Florida, Saline water systems, Aquifers, Groundwater movement, Brackish water, Water utilization, Reservoirs, Water storage, Research and development.
Identifiers: Belle Glade, South Florida.

A deep-well disposal system was operated for three years in the highly saline Boulder Zone of the Floridan aquifer in South Florida at Belle Glade. No trace of contamination was detected in an overlying, intermediate saline aquifer. If the hydrogeological conditions found in Belle Glade extend throughout southern peninsular Florida, an ideal situation is available for use of the deeper or Boulder Zone of the Floridan aquifer as a receiving zone of waste disposal. Groundwater flow is to the surrounding seas, discharging at considerable depth and away from shorelines. The less saline water of the upper part of the artesian aquifer can be used as a source of brackish water for future uses, or as an artificially recharged fresh-water storage reservoir. Frank J. DeLuise.
Technical Completion Report, Rhode Island Water Resources Center, 1969. 12 p, 1 tab, 4 fig, 3 ref. OWRR Project A-017-RI.

Descriptors: *Groundwater, *Iron, *Manganese, *Filtration, *Oxidation.

Iron and manganese have been removed from water solution by oxidation and filtration. Oxidation was accomplished by the addition of sodium hypochlorite or potassium permanganate, and filtration was through 0.22 micron membrane filters. The original solutions contained 2 mg/l of iron and 1 mg/l of manganese, and removals to below detection limits (0.025 mg/l iron, 0.0125 mg/l manganese) were accomplished in batch tests. Analysis was by atomic absorption spectrophotometry. Preliminary runs have been made employing this oxidation and filtration system in a flow process using a cartridge filter. Excellent removals of iron and manganese have been obtained, but excessive pressure drops need to be overcome to render the process feasible.
W70-02755

VIRUS REMOVAL BY CHEMICAL COAGULATION,
Illinois Univ., Urbana. Dept. of Civil Engineering.
Richard S. Engelbrecht, and Malay Chaudhuri.
Available from the Clearinghouse as PB-188 911, $3.00 in paper copy, $0.65 in microfiche. Final Report, Illinois Water Resources Center, Research Report No 25, Nov 1969. 66 p, 19 tab, 21 fig, 73 ref. OWRR Project A-020-ILL.

Descriptors: *Coagulation, *Flocculation, *Aluminum, Bacteriophage, Tertiary treatment.
Identifiers: Virus removal, T4, MS2, Coordination complex, Polyelectrolytes.

Using bacterial viruses (Bacteriophages T4 and MS2 against Escherichia coli) as models and aluminum as the coagulant metal ion, it was shown that removal of viruses from water by chemical coagulation and flocculation with aluminum sulfate consists of a primary reaction step which possibly results in the formation of coordination complexes between aluminum and carboxyl groups on the virus coat protein. The complexed viruses were not inactivated and active viruses could be recovered from the settled floc following their removal from water by coagulation and flocculation. The process of chemical coagulation and flocculation was found quite effective in removing bacteriophages T4 and MS 2 from water. The optimum coagulant dosages and pH values were 40 to 50 mg/l of aluminum sulfate at pH 5.24 for bacteriophage T4 and at pH 6.0 for bacteriophage MS2. The highest removals attained were 98.0 and 99.9 percent, respectively. Presence of vivalent cations like calcium and magnesium up to a concentration of 50 mg/l each did not interfere with the efficiency of the process. Organic matter like albumins, wastewater and wastewater effluent lowered the removal efficiency significantly. Commercially available cationic polyelectrolytes were found effective both as coagulant aids and as prime coagulants.

5G. Water Quality Control

INFLUENCE OF pH ON THE ADSORPTION OF AROMATIC ACIDS ON ACTIVATED CARBON,
North Carolina State Univ., Raleigh. Dept. of Chemistry.
Thomas M. Ward, and Forrest W. Getzen.
Environ Sci and Technol, Vol 4, No 1, p 64-67, Jan 1970. 4 p, 3 fig, 2 tab, 14 ref. PHS Grant ES-00177-02.

Descriptors: *Water pollution treatment, *Tertiary treatment, *Activated carbon, *Pesticides, *Chlorinated hydrocarbon pesticides, Aromatic compounds, Hydrogen ion concentration, Adsorption, Thermodynamics, Aqueous solutions, Pesticide kinetics, Water purification.
Identifiers: Aromatic acid removal.

Studies are reported of the adsorption on activated carbon over a wide pH range of 3 herbicides: 2,4-dichlorophenoxyacetic acid (2,4-D); 2-methoxy-3,6-dichlorobenzoic acid (Dicamba); and 3-animo-2,5-dichlorobenzoic-acid (Amiben). Equilibrium adsorption data on these and 7 other structurally related compounds fit Langmuir isotherms in the range of concentrations studied at all pH levels. There is a marked increase in the removal of all solutes from aqueous solutions on lowering the pH below 7.0. Adsorption in the acid region is greater than that expected from the molecular-ionic ratio of the bulk solution. This effect is explained in terms of an enhanced specific ion adsorption resulting from increasing proton concentration as the pH is lowered and a subsequent alteration in the surface properties of the carbon. Maximum adsorption is attained near the point where pH= pKa. At pH 3.0 approximately 50% of the herbicides in 0.0001 molar solution was adsorbed by 0.01 g of activated carbon in 4 hours. At pH 7.0, the removal generally ranged from 8-22%, and at pH 11.0, from 2.5-15%, depending on the specific herbicide present. (Knapp-USGS)

INTERSTATE COMMERCE - NAVIGABLE RIVERS - INDUSTRIAL WASTE CLOGGING CHANNEL HELD NOT UNLAWFUL OBSTRUCTION - UNITED STATES V REPUBLIC STEEL CORP (7th CIR 1959).

Harv L Rev, vol 73, no 6, p 1228-1231, Apr 1960. 4 p, 20 ref.

Descriptors: *Rivers and Harbors Act, *Navigable rivers, *Federal jurisdiction, *Navigation, Obstruction to flow, Legal aspects, Judicial decisions, Legislation, Regulation, Jurisdiction, Permits, Channels, Wastes, Liquid wastes, Solid wastes, Structures, Piers, Docks, Lake Michigan, Federal Government, United States, Rivers, Harbors, Barriers, Reasonable use, Industrial wastes
Identifiers: *Interstate commerce, *Injunction (Prohibitory), Calumet River, Penalties (Criminal).

Three steel companies were enjoined, under authority of the Rivers and Harbors Act of 1899, from depositing industrial wastes in a federally maintained channel. The circuit court in United States v Republic Steel Corp., 264 F2d 289 (7th Cir 1959), reversed on the grounds that obstructions resulting from deposits of solid wastes in suspension are not prohibited and injunctive relief is limited by statute to removal of structures. There are three possible common law bases for governmental relief: the jurisdictional grant in cases in which the United States is a party; the admiralty clause; and the commerce clause. An analysis of judicial decisions in which these jurisdictional bases have been invoked indicates that the government's success or failure in invoking these bases has depended on the type of interest it sought to protect. The courts have given standing to governmental attempts to protect an interest in internal functions but have denied standing where the interest is that of the sovereign representing the rights of its people. (Keith-Florida)

REMARKS BY CONGRESSMAN WILLIAM C. CRAMER BEFORE THE 56TH ANNUAL CONVENTION, NATIONAL RIVERS AND HARBORS CONGRESS.

Proceedings of the 56th Annual Convention, Nat'l Rivers and Harbors Congress, p 58-60, May 13-15, 1969. 3 p.

Descriptors: *Water resources development, *Federal budgets, *Political aspects, *Federal project policy, Project planning, Project purposes, Projects, National income, Water pollution control, Water pollution, Pollution, Water policy, Federal Government, Pollution abatement, Sewage treatment, Cost-benefit ratio, Costs, Cost-benefit theory, Cost-benefit analysis.
Identifiers: *National Rivers and Harbors Congress.

Good leadership in developing and preserving the Nation's water resources is essential to our country's future. Pollution and lack of conservation could become our most critical problem. Our pollution control programs must be upgraded. It is inexcusable that of the funds authorized for sewage treatment plant construction, only 30 percent in 1969 and 20 percent in 1970 were recommended. A new approach is being planned which would set a financing base, and the House Committee on Public Works is scheduling an investigation on the subject of updating the elements of the benefits-to-cost ratio. The Congress and the National Rivers and Harbors Congress should continue to oppose user charges. This year, additional basin authorizations will have to be considered and perhaps a two-year authorizing basis will be put on. When the Ominbus Rivers, Harbors, and Flood Control Bill is considered next year, the much needed water resources projects could possibly be included. (Smith-Florida)

PREVENTION OF POLLUTION.

U Det L J, vol 37, no 1, p 144-149, Oct 1959. 6 p.

Descriptors: *Michigan, *Water pollution control, *Sewage treatment, *Pollution abatement, Cities, Local governments, Regulation, Governments, Water supply, Sewers, Sewerage, Water pollution sources, Diseases, Sewage disposal, Treatment facilities, Disposal, Rivers, Streams, Costs, Financing, Government finance, Riparian rights, Planning, Resource development, Reasonable use, Administrative agencies.

The use of surface and groundwater for drinking or potable purposes is not always compatible with the disposal of domestic and industrial waste to the same source. There is a need for planning and regulation of the use of our water resources. Although the doctrine of riparian rights has prevailed since early times, judicial interpretations have gradually altered the meaning of the doctrine. The riparian doctrine of reasonable use is a modern source of pollution control. Such pollution control in Michigan dates back to the Civil War days. Today, the Water Resources Commission serves to control pollution. The United States Public Health Service has sponsered numerous programs of aid to municipalities under the new Federal Water Pollution Control Act. Many cities have also enacted antipollution ordinances on their own. Existing laws with public support and adequate enforcement staffs should be sufficient and adequate to abate pollution problems. However, there needs to be more inter-governmental cooperation in enforcement. Many raw sewage treatment plants have been completed or planned, but more must be done to arouse public support and to plan for future legislation and financing. (Smith-Florida)

WATER CONSERVATION AND RECLAMATION FUND.
Pa Const art 8, sec 16

Descriptors: *Pennsylvania, *Water conservation, *Water reuse, *Water resources development, Legislation, Legal aspects, Water resources, Pollution abatement, Water pollution, Recreation, Financing, Construction, Sewage, Pollutants, Water quality control, Treatment facilities, Acid mine water, Mine wastes, Mine acids, Waste water (Pollution), Water pollution sources

The State, by its constitution, is authorized to issue bonds in the amount of five hundred million dollars for a Land and Water Conservation and Reclamation Fund. The Fund will be used for the conservation and reclamation of land and water resources, for the elimination of acid mine drainage, sewage and other pollution from the streams of the state, and for providing financial assistance to state political subdivisions for the construction of sewage treatment plants, restoration of abandoned strip-mine areas, and development of park and recreational areas. POTOMAC RIVER POLLUTION.
Pa Stat Ann tit 32, sec 741 (1967).

Descriptors: *Pennsylvania, *Water pollution control, *Interstate compacts, *Interstate commissions, Interstate rivers, Water resources development, Governments, State governments, Federal government, Water policy, Water pollution, Water pollution sources, Legislation, Legal aspects, Surveys, Waste water (Pollution), Industrial wastes, Data collections, Inter-agency cooperation, Regulation, Standards, Classification, Administrative agencies, Financing.
Identifiers: Potomac River.

A commission is hereby created to act jointly with other member states on the Interstate Commission on the Potomac River Basin. The Governor is authorized to enter a compact with the other members in regard to the abatement of existing pollution and control of future pollution of interstate streams. The states of Maryland, West Virginia, Pennsylvania, and Virginia, and the District of Columbia shall comprise the Potomac Valley Conservancy District. The Commission, composed of representatives from member states, is empowered to: (1) collect and analyze data on pollution; (2) cooperate with local, state and federal agencies in formulating rules and regulations for pollution control and prevention; (3) disseminate public information in relation to stream pollution problems; (4) make, revise, and recommend reasonable minimum standards for treatment of sewage and industrial or other wastes before discharge into the waters of the district; and (5) establish reasonable physical, chemical, and bacteriological standards of water quality satisfactory for various classifications of use. Operations of the Commission shall be financed by the United States and the member states on a pro rata basis. (Kelly-Florida)

POLLUTION OF WATERS.

Pa Stat Ann tit 32, sec 815.31-815.35 (1967), as amended, (Supp 1969).

Descriptors: *Pennsylvania, *Delaware River Basin Commission, Boundaries (Property), Interstate rivers, *Water resources development, Water pollution control, Water policy, Interstate commissions, Administrative agencies, Planning, Legislation, Interstate compacts, Legal aspects, River basin development, River basins, Supervisory control (Powers), Delaware River, Water conservation, Pollution abatement.
Identifiers: *Intergovernmental cooperation.

The part of the Delaware River Basin lying within the boundaries of Pennsylvania is hereby declared to be a component part of an interstate region for the purpose of intergovernmental cooperation in the conservation, protection and development of water resources by means of integrated planning. The Delaware River Basin Commission is recognized as the established regional commission for such intergovernmental cooperation in this area. The Department of Health is directed to apply and carry into effect the provisions of the interstate agreement concerning control and abatement of pollution. The Department is hereby authorized to cooperate with the Commission in regard to pollution control and abatement, and in regard to further study of the sanitary condition of the waters of the Delaware River and its tributaries. (Kelly-Florida)

OHIO RIVER VALLEY WATER SANITATION COMPACT.

Pa Stat Ann tit 32, secs 816.1-816.7 (1967).

Descriptors: *Interstate compacts, *Interstate commissions, *Water pollution, *Pennsylvania, New York, Illinois, Kentucky, Indiana, Ohio, Tennessee, West Virginia, River basin commissions, Ohio River, Legal aspects, Pollution abatement, River basins, State governments, Water policy, Administrative agencies, Interstate rivers, Industrial wastes, Watershed management, Watersheds (Basins), Water quality control.

This Compact was entered into by the states of Illinois, Indiana, Kentucky, New York, Ohio, Pennsylvania, Tennessee, and West Virginia for the purposes of abating existing pollution and controlling any future pollution in the Ohio River Drainage Basin. The Compact establishes a Water Sanitation Commission which is composed of three representatives from each of the signatory states and three from the federal government. The functions of the Commission include the study of the pollution problems of the Ohio River Valley Water Sanitation District, the submission of reports for the prevention or reduction of stream pollution, and the recommendation of appropriate legislation dealing with water pollution problems. The Compact provides a procedure by which the Commission may order any municipality, corporation, person, or other entity discharging sewage or industrial waste into the Ohio River or any other river to discontinue such discharge, and it provides that such order shall be enforced by the courts of the signatory states. (Smith-Florida)

POLLUTION: TRESPASS ON STATE HATCHERIES.
Pa Stat Ann tit 30, secs 200-204 (Supp 1969).

Descriptors: *Pennsylvania, *Fish conservation, *Fish hatcheries, *Water pollution control, Legislation, Legal aspects, Explosives, Poisons, Fish management, Pollution abatement, Water pollution, Permits, Natural resources, Aquatic life, Administrative agencies, Beds, Banks, Obstruction to flow, Pollutants, Civil engineering.
Identifiers: *Trespass, Penalties (Criminal), Penalties (Civil).

No person will place in any waters of the state any electricity, explosives, or poisonous substance for the purpose of catching, injuring, or killing fish. No person will allow any substance harmful to fish to enter the waters of the state in the absence of a showing that every reasonable means has been used to abate and prevent such pollution. Explosives may be used for engineering purposes if a permit for such use has been obtained from the proper national, state, or local authority. Both civil and criminal penalties are provided for violation of the foregoing provisions. It is unlawful to fish or trepass on any waters, beds, or banks of any fish hatchery controlled by the Fish Commission. It is also unlawful to wilfully or maliciously damage any Commission property, or obstruct or pollute the water of any state hatchery. Criminal penalties are provided for the violation of the foregoing provisions. (Keith-Florida)
W70-02543

MISCELLANEOUS PROVISIONS (RELATING TO WATER).

Pa Stat Ann tit 30, secs 351, 361, 381, 391, 392 (1958).

Descriptors: *Pennsylvania, *Water pollution, *Oysters, *Interstate compacts, Legislation, Legal aspects, Canals, Rivers, Lakes, Ponds, Streams, Clams, Fish conservation, Delaware River, New York, New Jersey, Interstate rivers, Regulation, Industrial wastes.
Identifiers: *Set-nets, Penalties (Criminal), Rivulets.

It is unlawful for any person to place a set-net across any of the canals, rivulets or creeks of the state. All persons engaged in manufacturing or hide tanning who wash ore or use vitrol in the tanning process will prepare a tank to filter out wastes to prevent those wastes from entering the waters of the state. The importation into the state of oysters and clams for sale by unlicensed non-residents is prohibited. Violation of state conservation or fish laws in that part of the Delaware River lying between Pennsylvania and New York or Pennsylvania and New Jersey may be prosecuted in the state in which the violation was committed; this section will become effective when either New York or New Jersey enacts a similar law. Criminal penalties are provided for violation of any of the foregoing provisions. (Keith-Florida)

OHIO RIVER VALLEY SANITATION COMPACT.

Ky Rev Stat Ann sec 224.190 (Supp 1968).

Descriptors: *Kentucky, *Water pollution control, *Waste disposal, *Interstate compacts, Planning, Administration, Coordination, Legislation, United States, Local governments, State governments, Interstate commissions, Water pollution sources, Water policy, Water purification, Water pollution, Sewage treatment, Solid wastes, Sewage, Sewage disposal, Industrial wastes, Water pollution effects.

The Ohio River Valley Sanitation Compact, negotiated between Illinois, Indiana, Kentucky, New York, Ohio, Pennsylvania, Tennessee and West Virginia, is accepted by Kentucky. The purpose of the Compact is to reduce and control the pollution of the Ohio River Valley. Each state has pledged full support and cooperation and agrees to establish the Ohio River Valley Sanitation Commission. The Commission shall consist of three members from each state and three members representing the United States Government. The guiding principle of this compact shall be that pollution by sewage or industrial wastes originating within a signatory state shall not be allowed to injuriously affect the various users of interstate waters. All sewage or wastes shall be treated so as to remove all settleable solids and 45% of the suspendable solids. The Commission shall study and recommend pollution programs directed towards the interstate pollution problem. The Commission may issue orders requiring or forbidding conduct which involves pollution, and such orders are enforceable in any court of general jurisdiction or any United States District Court. (Darragh-Florida)

REAERATION MEASUREMENTS IN AN ESTUARY,
Dames and Moore, New York.
David W. Juliano.
ASCE Proceedings, Journal of the Sanitary Engineering Division, Vol 95, No SA6, Paper 6987, p 1165-1178, Dec 1969. 14 p, 7 fig, 5 tab, 12 ref, append.

Descriptors: *Reaeration, *Estuaries, *California, Winds, Waves (Water), Turbulence, Dissolved oxygen, Water quality, Oxygenation.
Identifiers: Sacramento-San Joaquin Delta (Calif).

Measurements of surface reaeration for the Sacramento-San Joaquin Delta were computed from observed diurnal dissolved oxygen changes in the estuary. The reaeration constants varied between 0.16 and 3.91 grams per cu m per hr at 0% saturation. Independent in-situ measurements using gasometeric and disturbed equilibrium methods were conducted for comparison. Reaeration constants varied from 0.64 to 2.84 gm per cu m per hr using the gasometric method. The disturbed equilibrium method yielded reaeration constants between 0.62 and 1.70 gm per cu m per hr. The independent methods showed reaeration constants to be highly variable. Surface turbulence proved to be the most important mechanism controlling reaeration constants in the estuary. Wind velocity was the singularly most significant parameter in causing surface turbulence. (Knapp-USGS)

CLEANING OUR ENVIRONMENT - THE CHEMICAL BASIS FOR ACTION,
Lloyd M. Cooke.
Report available for sale from American Chemical Society, Special Issues Sales, 1155 Sixteenth St, NW, Wash DC - 20036. Price - $2.75. American Chemical Society Report by Subcommittee on Environmental Improvement, Committee on Chemistry and Public Affairs, 1969. 249 p, 16 fig, 39 tab, 522 ref.

Descriptors: *Environmental engineering, *Pollution control, *Environmental sanitation, *Environmental effects, Air pollution, Water pollution, Water pollution control, Waste disposal, Water treatment, Air pollution effects, Pesticides, Public health, Sanitary engineering, Wastes, Water quality, Water chemistry.
Identifiers: *Environmental management, Pollution control chemistry.

The chemical aspects of air and water quality, and of environmental management in general, are discussed primarily for the involved and educated layman, particularly those involved in legislative and regulatory work. Scientists and engineers not working directly in the field of environmental management may also be interested. An objective account of the current status of the science and technology of environmental improvement is given. The information is analyzed and measures are recommended which should help, if adopted, to improve conditions and accelerate technological development. A bibliography of 188 entries is included. (Knapp-USGS)

DELAWARE RIVER BASIN COMMISSION ANNUAL REPORT 1969.
Delaware River Basin Commission, Trenton, N J

Delaware River Basin Commission, Trenton, NJ, 08663, 1969. 21 p.

Descriptors: *Water policy, *Interstate, *Institutions, *Water pollution control, Cost sharing, Regulation, Water pollution, Pollution abatement.
Identifiers: Effluent standards, Abatement schedules, Centralized waste treatment systems.

This is the annual report of the only interstate-federal organization covering the full range of water management in the United States. The economic significance of the report relates mostly to water quality control. The commission first adopted river quality standards similar to those imposed elsewhere. It was then estimated that this required a reduction by two-thirds of the oxygen-consuming wastes entering the estuary. This total was then subdivided into four zones, since it was found that economic efficiency would not be served by similar treatment of all zones. During 1969 an allotment was made to each industrial and municipal treatment plant of its maximum contribution to the total load. This transposes the stream standards, which represent only a general objective, to effluent standards, which represent a specific restraint on the individual polluter. Following this, abatement schedules are approved, by which the timing for meeting the target is agreed upon. A number of appeals are still pending, but 74% of the dischargers have already accepted the effluent standards. Progress is also being made towards organizing centralized (or 'regional') waste collection, conveyance and treatment systems, which are expected to provide advantages of economy, efficiency and easier pollution control. The operations of the DRBC are of great significance nationally, since similar actions will have to be taken in many developed regions, but institutions to establish such programs in large river basins are generally lacking. (Whipple-Rutgers)
W70-02694

AN EXAMINATION OF NONTREATEMENT PLANT ALTERNATIVES IN WATER POLLUTION CONTROL
Leonard Ortolano, and Harold A. Thomas, Jr.
Water - 1968, Chemical Engineering Progress Symposium Series, AIChE Vol 64, No 90, p 10-20, (1969).

Descriptors: *Systems Analysis, *Water quality control, *Water pollution treatment, *Water pollution control, Aeration.

Identifiers: Mathematical programming, Instream aeration, Ocean disposal, Removal bottom deposits.

There are a variety of alternative methods for controlling water quality in rivers and estuaries. Where dissolved oxygen is the water quality parameter under consideration, these alternatives include primary sewage treatment plants, secondary sewage treatment plants, tertiary sewage treatment plants, increase in the reaeration coefficient, control of combined sewer overflows, removal of bottom deposits, and piping of wastes outside the basin for ocean disposal. A series of mathematical programming models are presented to investigate the relative merits of these alternatives in a program to maintain a given dissolved oxygen concentration at minimun cost. The Delaware Estuary is used to present sample computations and results. The models are considered as a useful preliminary tool in answering the following questions. Which alternatives should be employed. When (and where) should they be introduced. At what scale should they be operated. (Whipple-Rutgers)

STUDY OF EQUIPMENT AND METHODS FOR REMOVING OIL FROM HARBOR WATERS,
Battelle Memorial Inst., Richland, Wash. Pacific Northwest Labs.
Paul C. Walkup, Palmer L. Peterson, Lloyd M. Polentz, Eric H. Phinney, and John D. Smith.
Available from the Clearinghouse as AD-696 980, $3.00 in paper copy, $0.65 in microfiche. Naval Civil Engineering Laboratory Port Hueneme, California, Final Report CR70.001, Aug 25, 1969. 53 p, 14 tab, 28 fig, 56 ref. US Navy Contract N62399-69-C-0028. NCEL Project YF38.534.003.01.002.

Descriptors: *Evaluation, *Oil wastes, Oily water, Water pollution sources.
Identifiers: *Oil spillage, Naval craft (US), Ports and harbors (Hydrological characteristics), Ports and harbors (Geographical characteristics, Ports and harbors (Physical features), Effectiveness, *Cost effectiveness.

A cost effectiveness analysis was performed for equipment, materials, and techniques for the removal of spilled petroleum products from the surfaces of ports and harbor waters used by U.S. Naval craft. Effectiveness criteria, formulated for presently practiced methods and available equipment and materials, included speed, completeness, ease of operation, effect on marine life, and availability. Parameters for the effectiveness study were based on the petroleum products now in use or planned for future use and a detailed review of the geographic, hydrographic, physical and environmental characteristics of ports used by the U.S. Navy. It was found that the two most cost effective systems for broad application were mechanical recovery of spilled material by surface suction devices supplemented by mechanical containment and the application of chemical dispersants by pier or vessel mounted high pressure spray equipment. Recommendations included: the development of additional technology pertinent to petroleum product spills of concern to Naval installation; additional management planning and preparation for coping with spill incidents; installation of equipment at Naval facilities to protect sensitive areas; and support of innovative development activities for improved equipment and methods for coping with petroleum spills.

CHEMISTRY OF THE OXIDANT, FERRATE, ITS INTERACTION WITH SPECIFIC ORGANICS FOUND IN WASTE WATER,
Kentucky Water Resources Inst., Lexington.
Donald H. Williams.
Available from the Clearinghouse as PB-188 800, $3.00 in paper copy, $0.65 in microfiche. Research Report No 20, Kentucky Water Resources Institute, Lexington, 1969. 13 p, 6 tab, 7 ref. OWRR Project A-008-Ky.

Descriptors: *Oxidation, *Chemical degradation, Waste treatment, Organic wastes
Identifiers: *Ferrate

Techniques for the preparation of potassium ferrate were reviewed and mechanical improvements made which allowed increased yields in shorter times. Relative rates of oxidation of a number of alcohols and other organic compounds were determined in 8M and 0.12 M KOH, and in a solution buffered to pH 8.04 with phosphate. The objective was to determine if the ferrates could be used to oxidize organic pollutants in water. Based on the results of this study, it must be concluded that such a process does not appear to be highly effective for dilute solutions.
W70-02738

EXAMINATION INTO THE EFFECTIVENESS OF THE CONSTRUCTION GRANT PROGRAM FOR ABATING, CONTROLLING, AND PREVENTING POLLUTION, B-166506, FEDERAL WATER POLLUTION CONTROL ADMINISTRATION.
General Accounting Office, Washington, D.C.

Available from the Comptroller General of the US, General Accounting Office, Washington, DC, for $1.00 per copy. Report to the Congress, General Accounting Office, Washington, DC, 1969. 164 p.

Descriptors: *Pollution abatement, *Water pollution control, *Benefits, Water pollution, Water quality, Systems analysis.
Identifiers: Centralized waste treatment systems.

The General Accounting Office (GAO) has examined into the effectiveness of the construction grant program of the Federal Water Pollution Control Administration (FWPCA), which is directed toward abating, controlling and preventing water pollution. During FY 1957-69, FWPCA awarded grants of about $1.2 billion for the construction of some 9,400 projects having a total estimated cost of about $5.4 billion. These projects have contributed to abating water pollution, but less effectively than they might have, since in many cases other major polluters nearby continued to discharge untreated or inadequately treated wastes. The program has been administered by awarding contracts on a readiness-to-proceed basis. Little consideration has been given to the immediate benefits to be received. GAO believes that the present level of Federal funding is inadequate to achieve a significant increase in the effectiveness of the program. Systems analysis techniques and evaluation of benefits are recommended. Planning should be conducted on a river basin basis, or by a single state agency for all of the state. There is also a criticism of the Dept. of Interior's minimum standard of secondary treatment for all effluents. Comments on the findings by the FWPCA are included, and are of interest. (Whipple-Rutgers)

COMBATING POLLUTION CREATED BY OIL SPILLS, VOLUME I: METHODS,
Little (Arthur D.), Inc., Cambridge, Mass
A. V. Pastuhov, S. S. Gray, and A. E. Wechsler.
Available from the Clearinghouse as AD-696 635, for $3.00 in paper copy, $0.65 in microfiche. Washington, DC: US Coast Guard, June 30, 1969. 151 p, 28 tab, 6 fig. Contract DOT-CG-93,374-A

Descriptors: Research and development, *Water pollution control, *Oil, *Cost analysis, Abatement, Absorption, Adsorption, Burning, Biodegradation, Detergents, Dispersion, Disposal, Operations, Equipment, Emulsifiers, Trace elements, Remote sensing
Identifiers: *Recovery equipment, *Containment equipment, Pumps (Vacuum), Air curtains, Booms, Sinking agents, Skimmers

Of primary interest to the professional, this study provides information on the state-of-the-art of available methods for combating oil spills, along with their basic technology. It rates the effectiveness of each method on the basis of technical, ecological, and operational considerations and presents qualitative cost information associated with actual oil spill cleanup operations. Discussed are mechanical removal, physical sinking methods, chemical dispersion, physical absorption, combustion, biological degradation. Because of the undeveloped state-of-the-art of the various combatant methods, the indicated costs in the cost analysis are not so much quantitative measures as they are comparative ones. Descriptors: *Phosphorus, *Iron, *Organic nutrients, *Ions (Sulfide), Reservoir ecology, Sulfides, Manganese, Filtration, Limnology, Anaerobic conditions.
Identifiers: *Lake Sidney Lanier (Ga), *Lake Hartwell (Ga)

The purpose of the research was to compare the animal cycles of phosphorus, iron, and functionally related elements in two large man-made impoundments, Lakes Sidney Lanier and Hartwell, Georgia. The research was expected to yield information on the effects of organic pollution that would be useful in management of other large impoundments and a base for comparison of future developments at the lakes. An analytical research laboratory was established to provide quantitative data on the various forms of phosphorus, iron, and functionally related elements. Laboratory procedures involving millipore filtration and persulfuric acid were developed to separate phosphorus and iron into its several forms for quantitative analysis by standard techniques. Much effort was expended to develop an improved technique for the quantitative determination of the sulfide ion. Precipitation techniques and sulfide stabilization methods were investigated and the results indicated that these techniques showed promise for accurate analysis when applied to samples in the field, providing stability for subsequent laboratory analysis. Termination of the research prevented further development. (Conway-Georgia Tech).

BUOYANCY AND SINKING CHARACTERISTICS OF FRESHWATER PHYTOPLANKTON,
Rhode Island Univ., Kingston.
Theodore J. Smayda.
Technical Completion Report, Rhode Island Water Resources Center, 1969. 7 p. OWRR Project B-006-RI.

Descriptors: *Flotation, *Sinking, *Phytoplankton, *Diatoms, *Blue-green alga, Copper sulfate.

The sinking rates of selected freshwater phytoplanktons were determined. The species were the diatoms Asterionalla formosa, Tabellaria flocculosa, and the blue-green alga Aphanizomanon flos-aquae. The sinking rates of some brackish-coastal water diatoms which have morphological homologues in freshwater were also investigated to examine the influence of morphology on sinking rate. Sinking rates of the freshwater forms used

vere found to approximate those (approximately .2 to 1 meters day-1) for marine phytoplankters. ncreased culture age and colony (Chain) size avored increased sinking rates. Sinking could be eightened by the addition of CuSO4, formalin and I. Killing by heat also heightened sinking. The ad- ition of 0.1% butanol and isopropanol also eightened sinking of the diatoms used, but only he butanol treated blue-green alga cells responded husly. These algae remained viable despite the al- ohol treatment. Their heightened sinking rate and, conversely, therefore one of their suspension ides) appears to related in toto (or primarily) to a hange in total cell density due to osmotic disrup- ions and/or disturbance of the cell membrane elec- rokinetics which can influence the hydrofuge or ydrophilic properties of the cell. The results with CuCO4 addition suggest that in addition to control f noxious water blooms through growth cessation y this agent, sinking of certain phytoplankters may lso be promoted leading to settling out of the rophogenic zone into the aphotic layers where emineralization occurs.

EVALUATION OF FACTORS AFFECTING STREAM SELF-PURIFICATION,
Washington State Univ., Pullman.
Donald E. Proctor.
Available from the Clearinghouse as PB-188 903, $3.00 in paper copy, $0.65 in microfiche. Final Report, Washington State Univ, College of Engineering, Bulletin 316, 1969. 39 p, 11 fig, 5 tab, 4 ref. OWRR Project A-008-WASH.

Descriptors: *Self-purification, *Stream models, Residence age, *Attached growth, *Tracers, Water quality, Streams.

Four identical parallel-flow models were constructed to simulate certain characteristics of flowing streams in order to evaluate self-purification processes. The models were maintained at nearly constant temperature and housed to prevent photosynthesis. Each model consisted of 28 sequentially connected, rectangular, plastic basins equipped with paddle agitators. The relationships of residence age of water at any point in the model to flow rates was determined both theoretically and empirically. The relationships agreed quite closely. The longitudinal dispersion of a tracer through the models is high but quite predictable using derived equations. The ratio of liquid volume to wetted surface area (i. e. effective stream depth) was very low. This resulted in a predominance of metabolic activity by attached organisms and a high degree of self-purification in the first few basins of any model. Substrate biodegradability, as indicated by k values for BOD exertion, changed significantly and rapidly as flow progressed through the models. Self-purification response to copper sulfate fed as a possible toxicant indicated a retardant effect that persisted beyond the wash-out period for the toxicant.

IMPOUNDMENT INFLUENCES ON WATER QUALITY,
Robert A. Taft Sanitary Engineering Center, Cincinnati, Ohio. Engineering Section.
James M. Symons, Samuel R. Weibel, and Gordon G. Robeck.
Journal American Water Works Association, Vol 57, p 51-75, Jan 1965. 19 fig, 2 tab, 45 ref.

Descriptors: *Water pollution control, *Streamflow, *Water quality, *Impoundments, Water purification, Simulation, Nitrogen, Water properties, Iron, Manganese, Oxygen requirements.
Identifiers: *Artificial destratification, *Impoundment releases, Simulation tanks, Soil-water contact columns, Impounded water quality.

This paper is concerned with the inadequately studied problem of the quality of impounded water and the practicability of release for stream regulation. Success of this method will require additional research in the systems analysis field, behavior of iron, manganese, nitrogen, phosphorus, and oxygen in impounded environments, influence of physical factors and fertilization, and the effect of impoundment releases on the quality of downstream water. Research now in progress is concerned with small-scale simulation of stratified impoundment and nitrogen transformations. Both thermal and chemical stratification have been accomplished in a 9-foot-high, 500-gal tank. Recorded profile values include temperature, dissolved oxygen, iron, manganese, pH, total hydrolyzable phosphate, and various forms of nitrogen. Nitrogen transformations have been observed in 5-gal glass jars provided with mechanical mixers and sampling siphons. Fortified water supplied vitamins, minerals, amino acids, and ammonium sulfate. The seed was obtained from an activated-sludge plant. Influence of seed variations, concentration of ammonia, and turbulence on dynamics of organic and mineral forms of nitrogen was recorded. A tentative suggestion is made that mechanical aeration may be a more feasible method of stream amelioration than dilution with water carrying 8 parts per million of dissolved oxygen. MINES AND MINING.

Pa Stat Ann tit 52, secs 30.51, 30.54, 30.56 (Supp 1969).

Descriptors: *Pennsylvania, *Mining, *Water pollution, *Air pollution, Legislation, Administrative agencies, Administrative decisions, Safety, Mine wastes, Coal mine wastes, Coal mines, Waste dumps, Water pollution sources, Industrial wastes, Mining engineering, Public health, Mine drainage, Dams, Drainage, Ditches, Standards, Water quality.

The operation of a coal refuse disposal pile is prohibited when it fails to comply with the established rules and regulations or quality standards adopted to avoid air or water pollution. Any operator of a coal refuse disposal pile may be ordered to build drainage ditches, trenches and/or gullies, to build impervious dams, to alter locations, to engage in spreading soil, or to use inert sealing materials if some or all of the foregoing are necessary to prevent or correct conditions of air or water pollution. Mine inspectors directed by the Department of Mines and Mineral Industries have the right to inspect and examine any coal refuse disposal area. Conditions which constitute a danger to any person, property, or highways or which fail to meet standards adopted to avoid air or water pollution may be ordered corrected. If there is a failure to comply, the Sanitary Water Board or the Air Pollution Commission may take appropriate actions under existing laws. (Schram-Florida)

SCHUYLKILL RIVER POLLUTION.
Pa Stat Ann tit 32, secs 751.1-751.9 (1967).

Descriptors: *Pennsylvania, *Water pollution control, *Desilting, *Supervisory control (Powers), Water pollution, Administrative agencies, Waste water (Pollution), Water pollution treatment, Abatement, Reservoirs, Levees, Dams, Construction, Dredging, Alteration of flow, Relocation, Area redevelopment, Legislation, Legal aspects, Silting, Silts, Condemnation, Regulation, Highway relocation.

The Water and Power Resources Board of the Department of Forests and Waters is hereby designated to carry into effect the project for the construction of desilting basins in the headwaters of the Schuylkill River and its tributaries to prevent the future silting and pollution of that river. The Board is authorized to: (1) clean out, widen, alter, dredge, deepen or change the course, current, or channel of the Schuylkill River or any of the tributaries; (2) fill up any abandoned canal or watercourse; (3) construct levees, dikes, walls, revetments, dams, reservoirs, and other improvements; and (4) prohibit any dredging operation deemed inimical to the purposes of the act. The Board may sell or lease materials or fill derived from dredging. The Board may enter into agreements with persons or municipalities for relocation of utility or telephone lines, highways, or other facilities. The Board may acquire easements, rights-of-way, or freeholds in carrying out this act, and may use condemnation proceedings under certain circumstances. The Board may obtain cooperation from federal, state, and local agencies. (Kelly-Florida)

CLEAN STREAMS LAW.
Pa Stat Ann tit 35, secs 691.3, 691.4 (1964), as amended, (Supp 1969).

Descriptors: *Pennsylvania, *Water pollution, *Water purification, *Streams, Water pollution effects, Water pollution treatment, Pollution abatement, Water pollution control, Wastes, Public health, Legislation, Water allocation (Policy), Legal aspects, Pollutants, Impaired water quality, State jurisdiction.

The discharge of sewage or industrial wastes or other deleterious substances which are injurious to public health or to animal or aquatic life is hereby declared an unnatural use of such waters and a public nuisance. The legislature has found it a matter of public policy not only to prevent further pollution of the state's waters, but also to reclaim and restore to an unpolluted condition every stream in the state. The Clean Streams Law should be interpreted to fulfill both objectives. (Kelly-Florida)

Descriptors: *Pennsylvania, *Water pollution control, *Sewage disposal, *Cities, Permits, Local governments, Public health, Legal aspects, Legislation, Financing, Sewage treatment, Administrative agencies, Supervisory control (Power), Treatment facilities, Pollution abatement, Regulation, Construction, Water quality control.
Identifiers: *Sewer systems, Penalties (Civil).

No person or municipality shall discharge sewage into any waters of the Commonwealth when such discharge is or may become injurious to the public health, animal, or aquatic life. The Sanitary Water Board shall order the discontinuance of existing discharges of sewage by notice in writing, and failure to obey such order within the time provided by the Board is declared a nuisance, punishable by fine and/or imprisonment. Municipalities with a sewer system which discharges sewage into the waters of the Commonwealth shall file a report of such sewer system upon written request of the Board. Municipalities may apply to the Board for a permit to discharge sewage into the waters of the Commonwealth. A permit may be granted if the Board finds such discharge is necessary and not injurious to the public health. All plans and relevant data for the construction of new sewer systems or the extension of existing sewer systems must be submitted to and approved by the Board. Municipalities may issue bonds to cover the costs of acquiring, constructing, or altering such sewer systems or sewage treatment plants as are required by the Board. (Sisserson-Florida)

FISH CONSERVATION.

Wis Stat Ann secs 29.283, 29.286, 29.288, 29.29 (1964), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Fish conservation, *Water pollution effects, *Fishkill, Legislation, Legal aspects, Conservation, Structures, Regulation, Nets, Administrative agencies, Ice fishing, Water pollution, Solid wastes, Explosives, Poisons, Pesticide toxicity.
Identifiers: Fish traps, Penalties (Civil), Penalties (Criminal).

The Conservation Commission will establish regulations governing the use of buildings, vehicles, tents, fish shanties, and similar shelters for fishing through the ice in the waters of the state. No person shall have in his possession any net or fish trap capable of taking, catching, or killing fish in specified counties. Whoever deposits, places, or throws into any waters of the state, or leaves on the ice thereof, any solid waste material will be subject to criminal penalties. The use and possession of explosive or stupefying substances in the waters of the state is prohibited, with specified exceptions. Violation of this provision will result in criminal penalties. No person will use, set, lay, or prepare in the waters of the state any substance deleterious to fish life other than such substances deposited in accordance with plans approved by the Committee on Water Pollution. No person will disperse any toxic insecticide in forest or non-crop areas in amounts sufficient to be of possible danger to the health of persons or wildlife. (Keith-Florida)

06. WATER RESOURCES PLANNING

6A. Techniques of Planning

OPERATIONS RESEARCH STUDY OF WATER RESOURCES DEVELOPMENT AND MANAGEMENT OF THE TUCSON BASIN,
Arizona Water Resources Research Center, Tucson.
Chester C. Kisiel, and Lucien Duckstein.
Available from the Clearinghouse as PB-188 797, $3.00 in paper copy, $0.65 in microfiche. Arizona Water Resources Research Center, Project Completion Report, Dec 1969. 27 p, 10 ref. OWRR Project A-010-ARIZ.

Descriptors: *Income analysis, *Operations research, *Pricing, *Water allocation, Computer models, Information retrieval, Model studies, Monte Carlo method, Numerical analysis, Parametric hydrology, Simulated rainfall, Synthetic hydrology, Time series analysis, Economic efficiency, Elasticity of demand, Economic prediction, Water rates, Water requirements, Water demand, Future planning, Water quality controls, Waste dilution, Oxygen sag, Natural recharge, Groundwatermining, Thunderstorms, Ephemeral streams.
Identifiers: *Econometric models, Arizona, Systems hydrology, Simulation of aquifers, Streamflow, and thunderstorm sequences, Water quality management.

The research objective was to undertake a systematic application of tools of operations research to problems of water resource management in metropolitan Tucson, Arizona. Concepts of general systems theory served as a basis for structuring the research and reviewing literature and were explicitly applied in the formulation of a simulation model for water quality management. Physical models were developed for the following processes: natural recharge from an ephemeral stream, point thunderstorm precipitation, and groundwater movement for the Tucson aquifer. Constraints on data availability were revealed by the econometric model of residential water consumption as a function of median family income. The major result of the study was development of a pricing model for optimal allocation of Tucson's groundwater, Colorado River water, reclaimed waste water and Avra Valley groundwater to municipal, industrial, and agricultural use. The objective function was formulated to maximize net revenues to a central water resource agency (presently not in existence) in the face of availability, requirements and social constraints. Actual data was used to obtain opportunity costs associated with mining or conserving Tucson's groundwater. A final result is an economic calculus model to study the influence of water price structure on collective utility of water

STOCHASTIC BASIS FOR COMPREHENSIVE RIVER BASIN PLANNING: PHASE I,
Union Coll., Schenectady, N.Y. Water Resources Research Group.
Fred G. Haag, Keith W. Bedford, Joseph W. Fischetti, and James D. Lloyd.
Available from the Clearinghouse as PB-188 798, $3.00 in paper copy, $0.65 in microfiche. Report, Water Resources Research Group, Union College, 1969. 49 p. OWRR Project C-1318.

Descriptors: *Mathematical models, *Systems engineering, Computer models, Monte Carlo methods, Optimization.

Results are given from Phase I of a study of the application of stochastic systems analysis to water resources problems. An extensive digital computer program was written to simulate the dissolved oxygen-biochemical demand dynamics in a river basin. The unsteady hydraulic equations were included in the model. Preliminary results indicate that the computer times required for simulation of an entire river basin will be impractical (on a GE415 computer). Migration of salinity in the Hudson River estuary was simulated on a digital computer when the calculated results were compared with U.S. Geological Survey data, the agreement was encouraging. A digital computer program was written to calculate the statistical parameters needed for a linear regression synthetic stream flow generator. Recommendations are given for Phase II.

Identifiers: *Netherlands, *Water resources research.

Water and land management research in the Netherlands between 1957 and 1967 is summarized. Topics of study include hydrological model studies, research techniques, general hydrology of the Netherlands, groundwater flow, land drainage, soil water, polders, irrigation, soil improvement, and rural development. Hydrological research in the Netherlands has a tendency to include more complex investigations and to integrate research of various disciplines to solve the problems of providing one of Europe's most densely populated regions with a high standard of living. GREAT LAKES BASIN COMPACT.

Pa Stat Ann tit 32, secs 817.1-817.6 (1967)

Descriptors: *Pennsylvania, *Great Lakes region, *Interstate commissions, Water resources development, Interstate compacts, Great Lakes, Navigation, Wildlife, Fish, Soil erosion, Soil conservation, Diversion, Water levels, Water policy, St. Lawrence River, Fishing, Natural resources, Regulation, Legal aspects, Administrative agencies, Water pollution.

The Great Lakes River Basin Compact is designed to promote the development and conservation of the water resources of the Great Lakes Basin. The Great Lakes Commission, as created under the compact, will exercise jurisdiction over so much of the following bodies of water as is included within the signatory states: Lakes Erie, Huron, Michigan, Ontario, St. Clair, and Superior; the St. Lawrence River; and all rivers, ponds, lakes, and other watercourses connecting with the St. Lawrence. The composition of the Commission is hereby established. The signatory states agree to consider the Commission's recommendations with respect to lake levels, pollution, navigation, fishing and wildlife resources, soil erosion, and diversion of waters from and into the basin. Any state may withdraw from the compact after six months notice. (Kelly-Florida)

INLAND WATERWAY TRANSPORTATION, STUDIES IN PUBLIC AND PRIVATE MANAGEMENT AND INVESTMENT DECISIONS,
Resources for the Future, Inc., Washington, D.C.
Charles W. Howe, Joseph L. Carroll, Arthur P. Hurter, Wm. J. Leininger, and Steven G. Ramsey.
Resources for the Future, Inc, Johns Hopkins Press, Baltimore, Md, 1969. 144 p.

Descriptors: *Inland waterways, *Evaluation, *Economic efficiency, Transportation, Economics, Technology.
Identifiers: Optimum level of investment, Optimum level of traffic.

Economic aspects of inland waterways transportation have been relatively little explored. This study summarizes information available and outlines a theoretical economic efficiency model for waterway investment and management. Aspects covered include technology and production functions for the two, returns to scale for the firm, determination of equipment requirements for the bargeline, traffic flow and congestion simulation, and the demand for inland waterway transportation. This demand model can be used to analyze effects of changes in specific demands for barge transportation. The results of this study should facilitate further research into major problems of government policy related to inland transportation. (Whipple-Rutgers)

A COMPREHENSIVE STUDY OF THE USE TAX AS A MEANS OF ALLOCATION OF WATER RESOURCES IN A CONJUNCTIVE USE SYSTEM,
California Univ., Davis. Dept. of Political Sciences.
Louis F. Weschler.
Available from the Clearinghouse as PB-188 917, $3.00 in paper copy, $0.65 in microfiche. Technical Completion Report WRC 180, California Water Resources Center, Nov 1969. 3 p. OWRR Project A-025-CAL.

Descriptors: *Use rates, Water allocation, Resource allocation, Costs, *Conjunctive use, *Cost comparisons, *Cost allocation.

An important problem in areas which have both ground and surface water supplies is management of the conjunctive system so each supply is devoted to its best use. In California, some local water districts have been authorized to levy a production or use tax on groundwater production; it could serve as a means of rational allocation of water resources among users and uses. None of the four water districts included in this project applied the use tax in a manner to secure optimal use of alternate water sources. The main restraints were found to be opposition to the use by important economic interests, legal constraints contained in California law restricting variations in taxes, and misunderstanding of the potential of the use tax by public officials of the districts. A model of idealized water supply, demand, cost, use and allocation was established for each district. Three projections, 1950-80, were established to compare with this model: actual patterns, trends based upon actual patterns, and hypothetical trends excluding use tax operations. It was found that in spite of wide variations in actual practice and suboptimal performance by all districts that the use tax is useful. In all four districts the relative distribution of ground and surface water to different uses was improved by the operations of the use tax. Thus, the tax does encourage rational planning and use.

Descriptors: *Pennsylvania, *Water wells, *Well permits, *Water conservation, Wells, Drilling, Groundwater, Water sources, Water supply, Permits, Well regulations, Regulation, Administration, Conservation, Water resources development, Resources, Natural resources, Administrative agencies.

Whereas the renewable natural resource of underground water must be developed in an orderly and reasonable manner, it is the policy of this state to encourage such development. A license shall be required to drill water wells, except for farming or residential uses. The Department of Internal Affairs may require any abandoned well to be sealed. A described application shall be made before any license is issued. A license shall be required for any drilling rig. The Department is empowered to revoke or suspend licenses for fraud in obtaining the same or failure to file reports or maintain records required by this act. Each licensee is required to keep a record of each well setting forth certain information. Failure to comply with these provisions is punishable by fine or imprisonment. The Department is authorized to effectuate the provisions of this act and to adopt rules and regulations. (Smith-Florida)

UNITED STATES PROJECTS.
Pa Stat Ann tit 32, secs 678.1-678.2 (1967).

Descriptors: *Pennsylvania, *Flood control, *Flood protection, *Flooding, Flood damage, Federal government, State governments, Local governments, Highways, Bridges, Check structures, Administrative agencies, Construction, Legislation, Legal aspects, Channel improvement, Dredging, United States.

The Commonwealth and its political subdivisions may grant easements to the United States and may enter into agreements with the federal government or its agencies concerning certain aspects of flood control. In any case, where the United States has commenced or finished any work on or construction of a retarding dam, channel improvement, or other flood control project in relation to any river, stream, or creek in the state, the authorized federal representatives may secure easements in highways or bridges when such action is necessary for the project's successful operation and for the safety of life and property. Rights which may be granted include: the right to flood any highways, bridges, or viaducts for temporary periods; the right to enter said highways and lands bordering them to widen rivers or streams or to erect structures upon such lands; and the right to relocate roads, bridges, viaducts, and other public works. PENNSYLVANIA FISHING REGULATIONS APPLYING TO INLAND WATERS AND BOUNDARY LAKES.
Pa Stat Ann tit 30, secs 10-100 (1958), as amended, (Supp 1969).

Descriptors: *Pennsylvania, *Fishing, *Fishing gear, *Fish management, Fish, Regulation, Administrative agencies, Legislation, State governments, Lakes, Inland waterways, Farm ponds, Bait fishing, Commercial fishing, Fly fishing, Sport fishing, Baits, Fish conservation, Sport fish, Nets, Permits, Fish harvest, Legal aspects, Fish types, Boats. Identifiers: Sturgeon.

Pennsylvania fishing regulations pertaining to inland waters include provisions concerning: (1) definitions of game fish, bait fish, fish bait, and regulated fishing lake; (2) closed seasons; (3) legal sizes; (4) creel limits on fish and fish bait; (5) net permits; (6) devices to catch game fish, bait fish and fish bait; (7) fishing in farm fish ponds; (8) licensing by the Pennsylvania Fish Commission and the necessity for licenses; and (9) penalties. Fishing regulations pertaining to boundary lakes include provisions concerning: (1) definitions of boundary lake, bay, peninsular waters, game fish, fish bait, bait fish, and food fish; (2) fishing devices; (3) creel limits; (4) closed seasons; (5) fish not to be used for fertilizers; (6) sturgeon; (7) rules, regulations, and powers of the Pennsylvania Fish Commission; (8) boat and net licenses; (9) the securing of spawn; (10) licenses to non-residents; (11) meshes of nets, licensing and use thereof; (12) legal size and weight of fish and fillets; (13) minnow nets; and (14) penalties. INDUSTRIAL WASTES.

Pa Stat Ann tit 35, secs 691.301-691.310 (1964), as amended, (Supp 1969).

Descriptors: *Pennsylvania, *Industrial wastes, *Water quality control, *Water pollution control, Administrative agencies, Legal aspects, Legislation, Acid mine water, Waste water treatment, Treatment facilities, Regulation, Public health, Surveys, Investigations, Waste treatment, Discharge (Water), Water pollution sources, Water pollution treatment.
Identifiers: Penalties (Civil).

It is unlawful to discharge industrial wastes into any waters of the Commonwealth unless permission has been given by the Sanitary Water Board. Persons who are discharging industrial wastes into such waters on the effective date of this act shall file with the Board a report including the kind, characteristics, and rate of flow of such discharge. The Board may order such persons to discontinue discharges injurious to the public health or to animal or aquatic life. 'Clean waters' are defined as waters which are, at the effective date of this act, free from any discharge of industrial waste; the Board shall never permit discharge of industrial wastes into such waters unless the wastes have been completely treated. No person shall open an establishment after the passage of this act which will discharge industrial wastes into the waters of the Commonwealth without providing adequate treatment works for the treatment of such wastes. Plans for the treatment works must be submitted to and approved by the Board prior to construction of the works. Violations of these provisions are misdemeanors, punishable by fine and/or imprisonment. (Sisserson-Florida)

WHARVES, DOCKS, HARBORS.

Pa Stat Ann tit 55, secs 301-302, 311-314, 322 (1964).

Descriptors: *Pennsylvania, *Docks, *Harbors, *Eminent domain, Legislation, Easements, Damages, Compensation, Cost repayment, Condemnation value, Cities, Public benefits, Navigable rivers, Delaware River, Administrative agencies, Administrative decisions, Bulkheads, Piers, Jurisdiction, Legal aspects, Water law.
Identifiers: Warfage, Dockage.

When the owners of wharves, docks, or landings adjoining the Delaware River, not in first class cities, disagree as to the proper apportionment of the wharfage or dockage payable to them, the Board of Commissioners of Navigation shall determine the relative proportions. This shall be done in accordance with the established customs and usages of the port involved, or if there are no such customs, according to justice and equity. Any person may appeal from such a decision to the county court of common pleas. Public landings on any navigable river which have become unnecessary may be taken by eminent domain for public purposes by the city in which they are located. The damages for the taking or injury of any property for use as a public sharf, pier, or bulkhead include full compensation for the value of said property taken and compensation for any damages to the plant. No structure erected pursuant to the provisions of this act may interfere with the general public use of wharves for river commerce. (Schram-Florida)

DEPARTMENT OF NATURAL RESOURCES.

R I Gen Laws Ann 42-17.1-1 thru 42-17.1-4 (1967).

Descriptors: *Rhode Island, *Natural resources, *State governments, *Administration, Resources, Land resources, Conservation, Forests, Land, Parks, Recreation, Water resources, Wildlife, Water resources development, Resource development, Governments, Legislation, Planning, Regulation, Public utilities, Agriculture, Harbors, Rivers, Development, Fishing, Marshes, Coordination, Supervisory control (Power).

The Department of Natural Resources is established with power and duty to: (1) supervise and control the protection, development, planning, and utilization of the natural resources of the state; (2) exercise all functions, powers, and duties heretofore vested in the Department of Agriculture and Conservation, the Division of Parks and Recreation of the Department of Public Works, or in the Division of Harbors and Rivers of the Department of Public Works; (3) cooperate with the Department of Health in the enforcement of water pollution laws, with the Development Council in its planning and promotional functions, and with conservation commissions of cities and towns. The Department is divided as follows: (1) the Park and Recreation Division with power to establish, operate, and maintain parks and recreation areas; (2) the Conservation Division with the duty to operate, maintain, and preserve forests, natural areas, marsh lands, wildlife areas, hunting and fishing areas; (3) the Agriculture Division, Harbors and Rivers Division, and Planning and Development Division to replace the departments of the same names; (4) the Division of Enforcement which enforces the laws and cooperates with other enforcement agencies. MILL DAMS.
Pa Stat Ann tit 55, secs 291 thru 293 (1964).

Descriptors: *Pennsylvania, *Mill dams, *Mills, *Dams, Legislation, Navigable streams, Dam construction, Damsites, Fish barriers, Fish passages, Boats, Navigation, Sites, Legal aspects, Fish conservation, Fish, Water works, Highways, Roads, Riparian rights.
Identifiers: *Obstruction to navigation, Penalties (Criminal), Penalties (Civil).

Owners of lands adjoining navigable streams may erect dams for mills or other waterworks and lead off so much of the waters of such streams as may be necessary for this purpose. However, such structures may not obstruct or impede the navigation of such stream, prevent the passage of fish, or infringe or injure the rights and privileges of other adjacent landowners. Violators of this chapter may be fined not more than one hundred dollars and may also be made to pay such damages to the person complaining as shall be found by jury. The court must also order every such obstruction removed to comply with the limitations of this act. If the owner of any boat or other vessel suffers damage or is delayed in his passage on any navigable stream by any dams as aforesaid, he may recover such damages from the owner of such dam. (Schram-Florida)

FISH AND GAME LAWS - GENERAL PROVISIONS.

R I Gen Laws Ann secs 20-1-7, 20-1-8, 20-1-10, 20-1-12, 20-1-14, 20-1-17 (1968).

Descriptors: *Rhode Island, *Wildlife conservation, *Wildlife management, *Regulation, Wildlife, Natural resources, Resource development, Fish conservation, Preservation, Hunting, Fishing, Game birds, Waterfowl, Fisheries, Legislation, Massachusetts, Lakes, Permits, Oysters, Shellfish, Commercial fish, Administrative agencies.

The Director of Natural Resources may make rules and regulations governing fishing in Wallum Lake, and he may confer with Massachusetts officials concerning fishing by Massachusetts residents in said lake. The Director is authorized to fix season and bag limits on fresh-water fish. He may appoint and delegate powers to conservation officers for the prosecution of laws relating to fisheries, shellfisheries, wild birds and wild animals. The Director and conservation officers are empowered to: (1) enforce all fish and game laws; (2) execute warrants and issue subpoenas for violations of rules and regulations; (3) take possession of any fish or game taken in violation of this state's laws; and (4) seize all fishing or hunting equipment or licenses used to violate state law. The Director may appoint oyster guards to protect leased oyster grounds and may make all regulations necessary for the enforcement of state shellfish laws. (Smith-Florida)
W70-02589

FREE AND COMMON SHELLFISHERIES.
R I Gen Laws Ann secs 20-9-17 thru 20-9-22, 20-9-26, 20-9-27 (1968).

Descriptors: *Rhode Island, *Administrative agencies, *Fish management, *Crabs, Regulation, Natural resources, Permits, Shellfish, Oysters, Clams, Mussels, Bays, Inlets, Fish reproduction, Legislation, Fish conservation, Conservation, Legal aspects.
Identifiers: *Coves, Quahaugs, Scallops, Penalties (Criminal).

The taking of blue and sand crabs is regulated. Only residents may take such crabs. The Director of Natural Resources may designate waters from which such crabs shall not be taken. Blue crabs may be taken only during the established season. Sex and size limitations are established for blue crabs. Persons violating these provisions are subject to various penalties. Persons taking shellfish at night are subject to fine and imprisonment. Persons trading in shellfish must obtain a license from the Director of Natural Resources. Licenses must deal only with licensed persons. The Director may, after a hearing, suspend licenses for violation of these provisions. License suspensions may be appealed to the superior court. (Duss-Florida)
W70-02590

FISH AND GAME: OYSTER GROUND LEASES.

R I Gen Laws Ann secs 20-10-26 thru 20-10-28, 20-10-30, 20-10-31 (1968).

Descriptors: *Rhode Island, *Oysters, *Beds, Riparian rights, Boats, Leases, Docks, Fish management, State jurisdiction, Regulation, Shellfish, Land tenure, Legislation, Rivers, Aquatic life, Legal aspects, Wildlife conservation, Conservation, Damages.
Identifiers: *Penalties (Criminal), Vessels.

Any person taking oysters from oyster beds at night shall be fined for each offense. Boats and equipment employed in the taking shall be forfeited. Taking oysters from private beds is subject to fine and imprisonment. Persons wilfully damaging private oyster beds shall be fined, and boats and equipment employed shall be forfeited. Persons taking more than two bushels of oysters from Trustan Pond during one day shall be fined. Any constable viewing the commission of these offenses may arrest and detain the offender without warrant. (Duss-Florida)
W70-02591

TOWN CONTROL OF FISHERIES.

R I Gen Laws Ann secs 20-17-1 thru 20-17-4 (1968).

Descriptors: *Leases, Rhode Island, *Shellfish, *Fisheries, Legislation, Ponds, Regulation, Preservation, Riparian rights, Fish, Clams, Oysters, Mussels, Cities, Fish conservation, Shores, Beds, Conservation, Aquatic life, Commercial shellfish, Fish managment, Wildlife conservation, Cultivation, Legal aspects.
Identifiers: Quahaugs, Scallops, Penalties (Criminal).

The electors of Tiverton may make regulations for the preservation of fish and may control the fisheries of Nomquit Pond within the town limits. The electors of New Shoreham may enact ordinances to protect and regulate the taking of shellfish and other fish in Great Salt Pond. Penalties may be imposed for violations of such ordinances. Subject to the rights of riparian owners, the town council of New Shoreham is authorized to regulate shell fisheries in Great Salt Pond by leasing one-acre lots to inhabitants of the state. Such leases are for the protection and cultivation of shellfish. Persons interfering with the rights of lessees or taking shellfish from their grounds without permission shall be fined for each offense. (Duss-Florida)
W70-02592

FISHING LICENSES.

R I Gen Laws Ann secs 20-5-1 thru 20-5-15 (1968).

Descriptors: *Rhode Island, *Fishing, *Permits, *Fish management, Regulation, Control, Fish, Fish conservation, Conservation, Wildlife conservation, Management, Fish guiding, Fishing stocking, Riparian rights, Stream improvement, Wildlife management, Hunting, Water sports, Wildlife, Recreation, Sport fishing, Legislation.

Regulations relating to the issuance of fishing licenses are provided. All money received from license fees is appropriated for: (1) the protection and propagation of fish and game; (2) the leasing of land and rights-of-way to streams and ponds to be stocked with fish; (3) stream improvement; and (4) fish and game law enforcement. The Director of the Department of Natural Resources has jurisdiction over all matters in the chapter and makes all needed regulations for the enforcement of this chapter. (Smith-Florida)

CULTIVATION OF FISH.
R I Gen Laws Ann secs 20-4-9 thru 20-4-15, 20-4-20 (1968).

Descriptors: *Rhode Island, *Fish reproduction, *Fisheries, *Fish management, Fish, Fish hatcheries, Reproduction, Regulation, Fish ladders, Fish passages, Fish migration, Fish guiding, Fish conservation, Wildlife management, Fish barriers, Life cycles, Legislation, Management, Conservation, Wildlife conservation, Administrative agencies, Natural resources, Legal aspects.

For the purpose of protecting and propagating fish and providing public fishing preserves the Director of Natural Resources may acquire any land, stream, lake, pond, or any part thereof upon such conditions as the owner and Director may agree upon. The Director may summarily seize and remove all obstructions to the growth, culture, or passage of fish. It is unlawful to rebuild any such structure or to fish in waters set aside for the cultivation of fish. It is unlawful to catch fish by hook and line from fisheries for three years after such fishery was stocked, except for certain black bass fisheries. An open season is set for waters set aside for shad and salmon cultivation. It is unlawful to use any seine or catch any fish within half a mile of any fishery. The Department may take fish from any fishery for fish culture or scientific observation purposes. The exclusive right to own, cultivate, and control all fish or shellfish in a pond artificially created by excavation shall belong to the proprietors thereof, whether such fish be artificially or naturally propagated. Certain restrictions apply to such cultivation. (Smith-Florida)

LANDS MAY BE GRANTED OR EXCHANGED TO PROMOTE BOATING.

Wis Stat Ann sec 27.115 (1964).

Descriptors: *Wisconsin, *Boating, *Beds, *Sailing, Legislation, Legal aspects, Navigation, Naval architecture, Ownership of beds, Recreation, Recreation facilities, Local governments, Cities, Water sports.
Identifiers: Naval science.

Any city or county which has acquired or may hereafter acquire title to the bed of any lake is authorized to transfer that title to any incorporated yacht club under certain conditions. The principal purposes of a yacht club, in order for it to qualify, must be the development and encouragement of boating, sailing, yacht building, naval architecture and science, and nautical knowledge, customs and beliefs. A city or county may either grant land to the yacht club or exchange for land owned by the yacht club. Such conveyances are valid so long as the yacht club uses the land for the purposes enumerated above. (Keith-Florida)
W70-02682

CULTIVATION OF FISH.

R I Gen Laws Ann secs 20-4-1, 20-4-2, 20-4-5, 20-4-8 (1968).

Descriptors: Rhode Island, Fish hatcheries, *Fish management, Fisheries, Fish populations, Fish establishment, Regulation, Fish, Reproduction, Wildlife conservation, Conservation, Fish conservation, Fish reproduction, Fish stocking, Shellfish, Research and development, Legislation, Administration, State governments, Aquatic life, Aquatic animals, Aquiculture, Inland waterways, Shores, Seashores.

The Director of Natural Resources may make any experiments in cultivating and developing all kinds of shellfish and for such purpose may hold and occupy exclusively any portion of the shores of the public waters or land within the state. The Director may make regulations for the protection of such areas and their animal life. The Department of Natural Resources may introduce, protect, and cultivate fish in the inland waters of the state and may make regulations for the protection of such fish. It is unlawful for any person to violate these regulations or to take any fish, fish spawn, or any apparatus used in hatching or protecting fish, without the consent of the person cultivating the same. (Smith-Florida)
W70-02718

FISHING BY NON-RESIDENTS.
R I Gen Laws Ann secs 20-6-1 thru 20-6-4 (1968).

Descriptors: *Rhode Island, *Fishing, *Trawling, *Permits, Commercial fishing, Fish, Fish harvest, Fishing gear, Equipment, Fish management, Fish conservation, Regulation, Administration, Wildlife management, State jurisdiction, Fishing, Lobsters, Aquatic animals, Commercial shellfish, Bass, Natural resources, Legislation.

No persons except citizens of this state shall take fish with or set any kind of beam or otter trawl in the public waters of this state. In certain locations it is unlawful for any person, firm, or corporation to operate otter trawls or beam trawls. It is unlawful for non-residents to take lobsters, tautog, bass, or other fish away in vessels. Any non-resident who holds a Connecticut fishing license may fish by angling in certain locations without a license from this state, provided such non-resident is subject to all the statutes of this state and provided Connecticut grants like privileges to holders of Rhode Island licenses. A non-resident who is a resident of a state which grants reciprocal privileges to Rhode Island citizens may apply to the Director of Natural

esources for a license to fish by beam or otter awl. The Director may suspend or cancel any ich license when the public interest requires. Smith-Florida)

LLOCATIVE IMPACTS OF FEDERAL AND TATE WATER DEVELOPMENT LAW,
'alifornia Univ., Los Angeles. Dept. of Economics.
'avid L. Shapiro.
'alifornia Water Resources Center, Technical 'ompletion Report WRC No W188, Nov 1969. 3 p. 'WRR Project B-065-CAL.

'escriptors: *Water allocation, *Water rights, Water transfer, Legal aspects, Water resources evelopment.

)ne aspect of the research focused on the interac- ons of California water law and federal water evelopment law. Problems arose out of the dif- culties of transferring water rights in the Central 'alley Project, creating inefficiencies. The second hase of the work involved a search for devices to void such legally created anomalies. One ap- roach was based on the issuance of transferable aper titles, and the second approach was based on he title insurance concept applied to water rights. Either plan, properly implemented, would correct he main impediment to transferability. Another hase of the work concerned improvements in ex- sting water development law. One topic studied oncerned the discount rates used to calculate fu- ure benefits and costs, and the analysis indicated he newly existing rates not sufficiently high. The uthor further suggests the use of incremental enefit-cost analysis. Another approach suggested he policy of having an adversary government agen- y review the work of planning agencies before uthorization.

t is unlawful to deposit fish offal or water im- regnated with fish in public tidewaters unless fil- ered in accordance with regulations of the town vherein such deposit is to be made. Every vessel sed for procuring fish oil or for dressing bait and ther fish in violation of this chapter shall be liable or all prosecution costs, and such vessel may be at- ached to secure any possible judgment. It is unlaw- ul to press fish for extracting oil on board any ves- el on any public tidewaters. It is unlawful to wil- ully place brush, trees or limbs in any waters of Charlestown Pond, except for the protection and ultivation of oysters. (Smith-Florida)
W70-02737

THE USE OF STREAM CHANNELS TO DELIVER STORED WATER: THE POSSIBILI- TY OF INTERFERENCE BY THIRD PARTIES,
North Carolina Univ., Chapel Hill.
Douglas R. Gill.
Available from the Clearinghouse as PB-188 916, $3.00 in paper copy, $0.65 in microfiche. Report No 32, Water Resources Research Institute of The University of North Carolina, Dec 1969. 34 p North Carolina Project NC-WAR-1.

)escriptors: *Water law, *Riparian rights, Water r[illegible], Water transfer.
dentifiers: Stream channels, Impounded waters.

This report is addressed to one aspect of the adap- ation of old water rights law to contemporary con- ditions: legal issues associated with the use of stream channels to deliver stored water from im- poundments. It identifies three possible threats of interference with these uses of stream channels for transmitting stored water. First: intervening ripari- an land owners might successfully object to the use of the channel for such artificial water carriage. Second: intervening riparian land owners might be able to intercept the released water before it reaches its destination, and without legal recourse by the intended beneficiary of the storage. Third: owners of riparian land situated below the point of intended use may be able to raise enforceable legal objections against a proposed withdrawal for public water supply purposes. Under existing riparian rights law in North Carolina, the report concludes, the first threat is probably insubstantial, while the second and third threats are significant. There may be some possibilities of moderating these risks in some cases via equitable concepts or doctrines of sovereign immunity or inverse condemnation. 'For the long run, however, it is difficult to imagine an efficient stored water system being operated under North Carolina law as it seems presently to exist.' (p 33). The report points to the possibility of legislative solutions, suggesting that further research is needed to explore legal aspects of such solutions, including possible constitutional issues. (Howells-North Carolina)

TAKING UP DRIFTING LUMBER.
Pa Stat Ann tit 32, secs 511-518 (1967).

Descriptors: *Pennsylvania, *Lumber, *Boats, *Rivers, Ohio River, Delaware River, Legal aspects, Lumbering, Damages, Riparian rights, Legislation.
Identifiers: Barrels, Oil barrels, Drifting lumber.

Any person may take up lumber of any kind or any flat-boat floating upon the waters of the Ohio, Al- legheny, or Monongahela rivers or any of their tributaries by posting a list and description of such lumber or flat-boat in a conspicuous place in the town or borough where such lumber or flat-boat was found. If the true owner does not call for and take away the same within three months, such lumber or flat-boat shall become forfeited to the person taking up the same. Any person so taking up lumber or flat-boats shall be reimbursed by the owner at set rates, and such person shall be liable for damages for failure to comply with this act. These provisions shall apply to full or empty oil barrels. Persons securing drifting lumber in the Schuylkill or Delaware rivers are entitled to com- pensation from the owner. It is the duty of any per- son in possession of previously drifting lumber to safely store the same, advertise the same in a local newspaper for four weeks, sell the same at public sale, and keep the proceeds for one year. (Smith- Florida)
W70-02806

SUSQUEHANNA AND LEHIGH RIVERS AND THEIR TRIBUTARIES, TREES, LUMBER, AND TIMBER THEREIN.

Pa Stat Ann tit 32, secs 541, 544, 551-552, 559 (1967).

Descriptors: *Pennsylvania, *Lumbering, *Flot- sam, Legislation, State governments, Administra- tion, Islands, Regulation, Tributaries, Legal aspects, Saw mills, Transportation.

Any person finding logs, shingles, boards, or lumber floating in the Susquehanna or Lehigh rivers has a duty to list the quality and quantity of such materials with the court. Publication of the finding shall be made. Unclaimed materials shall be forfeited to the finder. Owners and occupiers of islands in the Susquehanna River may act in accord with the provisions of this act with regard to lumber lodging on said islands. All persons placing lumber in the river above the Susquehanna boom must adopt a mark to be placed on such lumber which is to be registered in writing with the court. Cer- tificates of registration are prima facie evidence of the right to use such marks. No two persons shall have the same mark. All saw logs to be floated down the Susquehanna River between Northum- berland and the Maryland state line must be rafted and joined together or enclosed in boats and under the control and supervision of men thereon. All loose logs are subject to capture and possession un- less the owner makes timely demand and nominal payment for them. (Barnett-Florida)

Any municipality is authorized to increase its in- debtedness within state-established limits for the purpose of assisting the state in the construction or completion of any project or improvement for water conservation or flood control. Moneys may be appropriated by the municipalities only for ex- penditure on projects authorized by law. The state hereby declares its intention to repay funds ad- vanced by the municipalities for water conserva- tion and flood control projects. The Department of Forests and Waters shall have full power to use and expend funds advanced by municipalities for these purposes. (Kelly-Florida)

FISHING REGULATIONS APPLYING TO BOUNDARY RIVERS.
Pa Stat Ann tit 30, secs 110-158 (Supp 1969).

Descriptors: *Pennsylvania, *Fishing, *Delaware River, *Fishing gear, Fish, Regulation, Fish management, Legislation, State governments, Ad- ministrative agencies, State governments, Rivers, Bait fishing, Commercial fishing, Sport fishing, Fish conservation, Baits, Bait traps, Nets, Legal aspects, Fish harvest, Fish types, New York.

In setting forth fishing regulations applying to Pennsylvania's boundary rivers, this act establishes three differing articles affecting the Delaware River: provisions applying to the river above Trenton Falls; provisions applying to the river below Trenton Falls; and provisions applying to that portion of the river between Pennsylvania and New York. The articles, although varying in sub- stance concern: (1) definitions of game fish, bait

fish, and food fish; (2) permissible fishing devices for game fish, bait fish, and food fish; (3) seining for sturgeon and food fish; (4) stakes and fastened nets; (5) closed seasons for food fish, game fish, the use of nets, and the use of eelpots and fyke nets; (6) legal sizes and creel limits; (7) penalties for damage to nets and seines; (8) the use of nets on Saturdays and Sundays; (9) concurrent jurisdiction of states; (10) the sale of fish; (11) size of mesh for nets and seines; (12) closed seasons on shad; (13) taking fish for bait, scientific and stocking purposes; and (14) seizure of illegal devices. (Marsee-Florida)
W70-02809

DAMS, FISHWAYS, BAR-RACKS, OBSTRUCTIONS.
Pa Stat Ann tit 30, secs 185-196 (Supp 1969).

Descriptors: *Pennsylvania, *Fish passages, *Fish barriers, *Fish migration, Dams, Fish, Fish ladders, Intakes, Fish establishment, Fish stocking, Costs, Fish handling facilities, Fish conservation, Wildlife conservation, Fishing, Sport fishing, Fishing gear, Control, Animal control, Water conservation, Administrative agencies, Legal aspects, Legislation, State governments, Engineering structures.

Persons hereinafter erecting or maintaining dams in state waters must, upon written order from the Pennsylvania Fish Commission, erect such chutes, slopes, fishways, gates, or other devices as are necessary to enable fish to ascend and descend the waters in all seasons. Alternatively the Commission may elect to receive from such persons the sums of money herein specified to be applied to fish stocking and management. The above devices must be maintained in good working order and may be closed for repairs no longer than thirty days at one time. Where the persons notified fail to erect requested devices, the Commission may erect the devices and collect the costs from those persons. The Commission shall pay the cost of installing devices in already existing dams. Drawing off of waters inhabited by fish or interfering with dams requires Commission approval. Fishing near dams and devices except with rod and line and preventing the migration of fish are prohibited. Persons maintaining raceways, flumes, or inlet-pipes leading to a water-wheel, turbine pump, or canal must place bar-racks to prevent fish from entering therein. (Marsee-Florida)
W70-02810

BRIDGES OVER NAVIGABLE WATERWAYS AND RAILROADS.
Pa Stat Ann tit 36, secs 2911-2913 (1961).

Descriptors: *Pennsylvania, *Bridges, *Navigable waters, *Railroads, Navigable rivers, Navigation, Bridge construction, Construction, Bridge design, Dams, Canals, Barriers, Obstruction to flow, Lumbering, Rivers, Streams.

No bridge, frame or device shall be erected or sustained over any navigable waterway if such device in any way hinders the navigation of any craft or float of logs. This shall not limit maintaining and repairing drawbridges and public bridges or the making of dams, mounds, or tide banks for the draining of low grounds and improving meadows. The laws relative to the erection of bridges over rivers and creeks are extended to the erection of bridges over canals and railroads. Bridges shall not obstruct the canal or railroad over which such bridge is erected. (Smith-Florida)
W70-02811

AUTHORITY TO ERECT BRIDGES.
Pa Stat Ann tit 36, secs 2972-2989.49 (1961), as amended. (Supp 1969).

Descriptors: *Pennsylvania, *Bridges, *Rivers, Bridge construction, Streams, Eminent domain, Condemnation, Public lands, Highway relocation, Road construction, Highways, Structures, State governments, Administration, Legislation, Railroads.

The Department of Highways, with the Governor's approval, is authorized to erect bridges at named locations over the Susquehanna, Monongahela, Allegheny, Clarion, Chester, and Schuylkill Rivers and over certain railroad tracks in Altoona. Said Department is authorized to acquire the necessary land for approaches thereto and shall have all powers conferred with respect to relocation, widening or construction of highways. Several of said bridges shall be toll bridges until such time as the costs of constructing or acquiring said bridge shall be paid. The other bridges shall be toll free and maintained by the Department of Highways. (Smith-Florida)
W70-02812

DELAWARE RIVER BRIDGE COMPACT.
Pa Stat Ann tit 36, secs 3511, 3512, 3521 (1961).

Descriptors: *Pennsylvania, *Interstate compacts, *Bridge construction, *Delaware River, Highways, Bridges, Administration, Administrative agencies, Tunnels, Tunnel construction, Tunneling, Underground, Structures, Rivers, Streams, Navigable waters, Navigable rivers, Transportation, Construction, Legislation, New Jersey.

The Governor is authorized to enter into a compact with New Jersey in substantially the following form: The Pennsylvania Turnpike Commission and the New Jersey Turnpike Authority are empowered to locate and make plans for a bridge across the Delaware River to connect the turnpike systems of both states. Said Commission and Authority are empowered to enter into agreements setting forth the details of erecting and maintaining such bridge. Upon coming into force, such Compact shall be binding upon Pennsylvania and the Pennsylvania Turnpike Commission and shall have the force and effect of a statute. The Governor shall appoint three citizens to the Delaware River Bridge and Tunnel Commission to plan and construct one or more bridges or tunnels as may be necessary for traffic over or under all navigable streams or rivers which streams or rivers are boundaries of this state. (Smith-Florida)
W70-02813

DELAWARE RIVER TUNNEL AND BRIDGE.
Pa Stat Ann tit 36, secs 3561, 3581 (1961), as amended, (Supp 1969).

Descriptors: *Delaware River, *Bridge construction, *Tunnel construction, *Pennsylvania, Rivers, Bridges, Construction costs, Financing, Interstate rivers, Tunnels, Delaware, Highways, Planning, Cost analysis, Project planning, State governments, Legal aspects, Legislation, Administrative agencies, Transportation, Port authorities.

The Delaware Tunnel Board is authorized to construct and operate a tunnel or tunnels under the Delaware River, connecting Pennsylvania with New Jersey, to facilitate vehicular traffic between the two states. The Delaware River Port Authority is empowered to finance, construct, acquire, and maintain a new toll bridge and such approaches thereto as are deemed necessary. The Authority is to proceed according to a plan approved by the legislatures of Pennsylvania and New Jersey. The new bridge is to be used for vehicular traffic and is to be built across the Delaware River. (Kelly-Florida)
W70-02814

FISH AND GAME.
Wis Stat Ann secs 29.135, 29.137, 29.14, 29.145 (1964), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Permits, *Fish, *Baits, Administrative agencies, Rough fish, Minnows, Shellfish, Fish handling facilities, Commercial fish, Fish harvest, Transportation, Regulation, Frogs, Crayfish, Fish hatcheries, Bait traps, Smelts, Inland waterways, Nets, Legislation, Supervisory control (Powers).
Identifiers: Bait dealers, *Fish dealers, Licensing.

Fish dealers must be licensed by the Conservation Commission. Licensees shall transport only properly labeled packaged fish. The licensee shall keep a record of all purchases of fish. Licenses from the Commission are likewise required for bait dealers. Bait is defined as any frog, crayfish, or minnow used for fishing. The Commission may regulate methods of taking, handling, and storing bait, equipment used, and may require reports from dealers. All bait dealers shall keep proper records of wholesale transactions in the production, buying, and selling of bait. The Commission shall regulate by permit the taking of bait from specified waters. These provisions do not apply to bait produced in licensed private fish hatcheries. Criminal sanctions are provided for violations of the provisions. With limited exceptions, a fishing license is required to fish in inland waters. (Dearing-Florida)

POWER OF BOARD OF COMMISSIONERS OF NAVIGATION TO LICENSE PILOTS.

Pa Stat Ann tit 55, secs 31, 41 thru 44 (1964)

Descriptors: *Pennsylvania, *River regulation, *Permits, *Navigable rivers, Legislation, State governments, Administration, Harbors, Inland waterways, Navigation, Boating regulations, Inspection, Boats, Transportation.
Identifiers: Pilots, Examinations, Qualifications, Licenses.

The Commissioner of Navigation has authority to grant licenses to persons to act as pilots on the Delaware River and to make and publish rules governing pilots and penalties for their breach. They decide differences arising between owners, pilots, and consignees of ships. Such decisions are reviewable by the court of common pleas. All current pilots are entitled to receive a license and subsequent renewals. No new pilots' licenses will be distributed until the class of current pilots is reduced. Those wishing to be a pilot must apply to the Commission, who will judge their qualifications on examination by a first class pilot. Classification of pilots will be determined by capability of piloting ships of different drafts. Licenses are valid for one year. Piloting a ship over seventy-five tons without a valid license is a misdemeanor. The fee for licensing is fifty cents. The qualifications for a pilot's license are listed. (Barnett-Florida)
W70-02817

RIGHT TO RUN TUNNEL UNDER RIVER TO COAL MINE.

Pa Stat Ann tit 52, sec 2 (1966).

Descriptors: *Pennsylvania, *Coal mines, *Navigable rivers, *Tunnel construction, Legislation, Tunneling, Tunnels, Mining engineering, Mining, Excavation, Underground structures, Construction, Maintenance, Administrative agencies, Administrative decisions, Streambeds, Ownership of beds, Submerged lands.

Whenever the power or manufacturing or mining plant of any company is situated upon the bank of any navigable stream and the company has the right to mine coal from land on the adjacent bank, such company may construct, operate, and maintain tunnels under said stream. These tunnels shall serve to connect the coal lands with said power or mining plant of the company. Before any company begins the construction of any tunnel, it must make application to, and secure the approval of, the Water and Power Resources Board. Companies constructing such tunnels shall pay to the Commonwealth of Pennsylvania the fair market value for all coal mined in constructing said tunnel. (Schram-Florida)
W70-02818

MINING SAFETY ZONES.
Pa Stat Ann tit 52, sec 3101 (1966).

Descriptors: *Pennsylvania, *Mining, *Safety, *Hazards, Zoning, Legislation, Regulation, Streams, Rivers, Bodies of water, Natural streams, Artificial watercourses, Administrative decisions, High water mark, Banks, Beds, River beds, Streambeds.

A safety zone is established beneath and adjacent to every stream, river, and natural or artificial body of water that is sufficiently large to constitute a hazard to mining in the opinion and in the discretion of the Department of Mines and Mineral Industries. Such safety zone shall extend horizontally two hundred feet from either the high water mark or known perimeter of the body of water. In any case, the zone shall extend downward to the limit of the workable beds. (Schram-Florida)
W70-02819

COUNTY'S RIGHT OF ENTRY FOR CONSTRUCTION.
Pa Stat Ann tit 16, secs 5905-5907, 5912 (1956).

Descriptors: *Pennsylvania, *Construction, *Bridges, Legislation, Maintenance, Culverts, Boundaries, Transportation, Roads, Storm drains, Channels, Ditches, Local governments, Damages, Alteration of flow, Obstruction to flow, Supervisory control (Power), Structures.

In the construction or maintenance of any county road or highway, the county is authorized to enter upon any private property except a railroad company's right-of-way. Such entrance is allowed for maintenance or construction of storm water drains, ditches, channels, and the inlets thereto. The county must pay any damages incurred by the owner of the land entered upon. Impairing or damaging any drain, channel, or ditch within the county by stopping or diverting the course of it shall be punishable by fine upon conviction before a magistrate. Roads forming or intended to form a continuous highway from one county to another and which cross a river, creek, or rivulet that forms the boundary line of those counties may be laid out, altered or vacated in the manner provided for other roads, except that such alteration is subject to judicial control. (Barnett-Florida)
W70-02825

FLOATING LUMBER ON THE DELAWARE RIVER.
Pa Stat Ann tit 32, secs 481, 485-487 (1967).

Descriptors: *Pennsylvania, *Lumber, *Delaware River, *Lumbering, Legal aspects, Barriers, Obstruction to flow, Structures, Concrete structures, Dams, Walls, Diversion structures, Piers, Damages, Riparian rights, Tidal waters, Legislation.
Identifiers: Drifting lumber, Rafts.

All prersons taking possession and safely securing lumber found adrift in the Delaware River shall be entitled to compensation from the owner of such lumber at set rates. Where lost lumber shall lodge upon the shore of the Delaware River, the owner of such shore shall advertise the lumber according to law and if the owner of such lumber does not appear, the owner of such shore may appropriate such lumber to his own use. Upon appearing, the owner of such lumber shall compensate the owner of the shore at set rates. When any lumber in raft is injured in consequence of piers, dams, wings, walls, or other obstructions in the Delaware River, an impartial umpire shall assess the damages and make an award. This shall not apply to loose rafts or rafts in the tidewaters. (Smith-Florida)

ARTIFICIAL PROPAGATION LICENSES AND SEINE LICENSES.
Pa Stat Ann tit 30, secs 160-165, 170-177, 179-181 (Supp 1969).

Descriptors: *Pennsylvania, *Nets, *Permits, *Fish hatcheries, Fish, Fisheries, Fish farming, Fish handling facilities, Fish management, Fish conservation, Legal aspects, Legislation, State governments, Federal government, Farm ponds, Fish establishment, Administrative agencies, Fishing gear, Carp, Herrings, Tidal waters, Fish eggs, Fry, Fish stocking, Baits.

The Pennsylvania Fish Commission is authorized to: (1) issue seine licenses; (2) regulate the kinds and mesh size of seines which may be used; (3) govern the content, expiration, and production of such licenses; (4) limit seine use to tidal waters, specific kinds of fish, and designated seasons; and (5) require the consent of the seine owner for removal of fish from seines. Fish artificially propagated are not subject to the seine license provisions. The Pennsylvania Fish Commission is authorized to: (1) issue artificial propagation licenses; (2) regulate the issuance of live bait licenses; (3) limit the authority under propagation license; (4) restrict the waters usable for commercial propagation and prohibit devices interfering with fish migration; (5) regulate the sale of fish, bait fish, and fish bait; (6) provide for the inspection of the books and property of license holders; (7) prohibit stocking with fish or eggs from Commonwealth waters; (8) make specific acts related to propagation unlawful; and (9) accord the federal government the right to establish fish-cultural stations in Pennsylvania. (Marsee-Florida)
W70-02831

WILDLIFE CONSERVATION.
Wis Stat Ann secs 29.148, 29.16, 29.174 (1964), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Wildlife conservation, *Regulation, *Permits, Legislation, Legal aspects, Administrative agencies, Michigan, Minnesota, Iowa, Fishing, Clams, Interstate compacts, Inland waterways, Recreation, Fish conservation, Wildlife management.
Identifiers: *Sturgeons.

A valid license is required for taking sturgeon by spear. So long as the states of Michigan, Minnesota, or Iowa confer upon the licensees of Wisconsin reciprocal rights, fishing and clamming licenses issued by those states will be recognized by Wisconsin in boundary waters. Seasons, bag limits, and size limits for the taking of game and fish are to be established and maintained. It is the responsibility of the State Conservation Commission to establish such regulations so as to conserve the wildlife supply and insure the citizens of the state continued opportunities for good fishing, hunting, and trapping. The method by which the Commission is to establish regulations governing the foregoing matters is provided. The Commission is directed to perform such acts as are necessary to conduct and establish a wildlife restoration project in compliance with certain acts of Congress. (Keith-Florida)

FISH AND GAME.

Wis Stat Ann secs 29.38, 29.39, 29.43, 29.44, 29.47, 29.475, 29.48 (1964), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Wildlife, *Permits, *Fish conservation, Administrative agencies, Regulation, Transportation, Personnel, Inland waterways, Indian reservations, Interstate, Commercial fishing, Wildlife management, Clams, Mussels, Legal aspects, Seasonal, State governments, Legislation.

It is unlawful to catch or kill mussels or clams during the close season or to have possession of any game or game fish other than in the open season. Transportation of game and fish other than in the open season is forbidden. No game may be transported in trunks or valises on any common carrier. All shipments of game must be clearly labeled. No game may be transported interstate or received interstate in violation of the laws of other states where such game was taken unless taken under license duly issued by that state. Transportation of fish from inland waters is strictly regulated with regard to amount, type, and weight. Separate restrictions are placed on fish from outlying waters. The sale of game and fish is unlawful during the close season whether taken lawfully within or without the state. Fish taken from outlying waters are subject to the commercial fishing regulations. (Barnett-Florida)
W70-02837

BRIDGES MADE SAFE.
Wis Stat Ann sec 195.31 (1957).

Descriptors: *Wisconsin, *Bridges, *Safety, *Railroads, Legislation, Legal aspects, Administrative agencies, Streams, Bridge construction, Maintenance, Repairing, Costs, Cost allocation, Damages, Cities.

When specified parties file a complaint with the Public Service Commission to the effect that a railway bridge over a stream is unsafe, the Commission will hold a hearing. If it is found that the railway bridge is unsafe, the Commission will determine what type of alteration, repair, or reconstruction is necessary to insure safety. The Commission will then apportion costs, damages, and expenses among the railroad company and other parties in interest. (Keith-Florida)

A PRELIMINARY ECOLOGICAL SURVEY OF THE WATER RESOURCES AND LAND USE PATTERNS OF THE DISMAL SWAMP AREA OF VIRGINIA,
Virginia Polytechnic Inst., Blacksburg.
C. Duke Wilder, Jr., Paul M. Brady, George M. Simmons, Stuart E. Neff, and L. A. Hart.
Project Completion Report, Virginia Water Resource Research Center, 1969. 4 p. OWRR Project A-020-VA.

Descriptors. *Aquatic habitats, *Ecology, *Fish populations, Limnology, Primary productivity, Vegetation, Water resources, Wetlands, Temperature, Acidity, Salinity, Oxygenlevels.
Identifiers: *Dismal Swamp, *Lake Drummond.

A detailed analysis of the fish populations was made and some suggestions were made concerning fish management in Lake Drummond. Information was acquired on temperature, oxygen levels, acidity, salinity, and primary productivity. Aerial photography of a selected portion of Dismal Swamp was flown using several film and filter techniques. It was concluded that the most important single need for an understanding of the environment of Dismal Swamp is a one- or two-year detailed limnological study. There is an indication from this study that the basic physical and chemical conditions of the water are not conductive to a high, balanced, biological productivity, but this aspect required much more detailed study.

DATA ERROR EFFECTS IN UNIT HYDROGRAPH DERIVATION,
New South Wales Univ., Sydney (Australia). Dept. of Civil Engineering; and Imperial Coll. of Science and Technology, London (England).
Eric M. Laurenson, and Terence O'Donnell.
ASCE Proc, J Hydraul Div, Vol 95, No HY6, Pap 6887, p 1899-1917, Nov 1969. 19 p, 7 fig, 6 tab, 10 ref, append.

Descriptors: *Hydrograph analysis, *Unit hydrographs, *Rainfall-runoff relationships, *Flood forecasting, Streamflow forecasting, Sampling, Rain gages, Discharge (Water), Hyetographs, Hydrographs, Hydraulics, Hydrology, Data processing.
Identifiers: Hydrograph synthesis.

Errors in rainfall and streamflow data cause errors in derived unit hydrographs. The effects of various types of data error on unit hydrographs derived by various methods have been examined. The data errors studied were those in the loss-rate assumption, total rainfall measurement, the discharge rating curve, base-flow separation, and time synchronization of rain gages and streamflow recorder. The methods of derivation were the harmonic, Laguerre, least squares, and gamma distribution methods. Effects of hyetograph and unit hydrograph shapes were also investigated. It was concluded that unit hydrograph shape had little effect, and that hyetograph shape had little effect except in combination with the Laguerre method, when it was of critical importance. No single method of derivation could be recommended in preference to the others. Synchronization-type data errors and the uniform loss-rate assumption tend to produce significant errors in the unit hydrograph, but the other error types caused surprisingly low errors. (Knapp-USGS)

TRIANGULAR BROAD-CRESTED WEIR,
Saskatchewan Univ., Saskatoon. Dept. of Civil Engineering; and Colorado State Univ., Fort Collins.
Clifford D. Smith, and Wen S. Liang.
ASCE Proc, J Irrig and Drainage Div, Vol 95, No IR4, Pap 6954, p 493-502, Dec 1969. 10 p, 9 fig, 1 tab, 4 ref, append.

Descriptors: *Stage-discharge relations, *Weirs, *Water measurement, Critical flow, Flow measurement, Discharge (Water), Open channel flow, Hydraulics, Discharge measurement, Gaging stations, Gages.
Identifiers: Broad-crested weirs.

The advantages of flow measurement with a thin plate V-notch weir and a broad-crested weir are reviewed briefly. The triangular broad-crested weir is intended to combine the advantages of both in a single structure. The discharge coefficient and limiting submergence are derived from simple theory based on the assumption of critical flow. Details are given for experiments carried out on a weir with a 90 deg notch angle and four different lengths of broad crest. It was found that the actual coefficient was less than theoretical and was not constant; however, the limiting submergence agreed exactly with theory, provided the length of the broad crest was at least three times the head. A design curve for the coefficient is included.

ENUMERATION OF AUTOTROPHIC AMMONIUM-OXIDIZING BACTERIA IN MARINE WATERS BY A DIRECT METHOD,
Rutgers - The State Univ., New Brunswick, N.J. Dept. of Environmental Sciences.
M. S. Finstein.
Applied Microbiology, Vol 16, No 11, p 1646-1649, Nov 1968. 3 fig, 2 tab, 10 ref.

Descriptors: *Marine microorganisms, *Nitrification, *Bacteria, *Methodology, Nitrites, Eutrophication, Analytical techniques, Ammonium salts, Nitrogen cycle, Cycling nutrients, Water pollution effects.
Identifiers: *Autotrophic microorganisms, *Bacteria counting, *Techniques, Most-probable-number technique, Enumeration techniques.

A new method is presented for enumerating those autotrophic nitrifying bacterial colonies capable of oxidizing ammonia to nitrite, and compared with the MPN (most-probable-number) technique. In this method, membrane filtration is followed by 18-25 days incubation of the filter on the surface of glass wool pads saturated with ammonium-rich nutrients. Membranes are then freed of nitrite and incubated on the surface of ammonium-containing agar for 5-30 minutes. Application of standard reagents for nitrite develops colored spots on the agar, coinciding with nitrifying colonies on the membrane, which colonies are dependent on the presence of ammonium in the agar. Membranes with single nitrifying regions caused vigorous nitrification when transferred to mineral salts medium, while membranes without nitrifying regions did not. Author concludes that filter technique is adequately sensitive and more precise than MPN. Results from replicate membrane samples fell within confidence limits of those from replicate MPN samples. Confidence limits of estimates from replicate membrane tests were narrower than those from MPN tests. Only seawater samples were tested, but the technique may be adaptable to fresh waters. Author evaluates advantages and disadvantages for the two methods, and presents a technique for increasing filtration speed. (Gerhold-Wisconsin)

BASIN TRACER CURVES INTERPRETED BY BASIC ANALYTICS,
Bason and Filter Specialty Co., Shreveport, La.
A. Adler Hirsch.
ASCE Proceedings, Journal of the Sanitary Engineering Division, Vol 95, No SA6, Paper 6951, p 1031-1050, Dec 1969. 20 p, 7 fig, 2 tab, 25 ref, append.

Descriptors *Tracers, Tracking techniques, *Sediment transport, Reservoirs, Watersheds (Basins), Sedimentation, Streamflow, Dye releases, Mathematical studies, Analytical techniques.
Identifiers: Basin tracer curves.

A basin flow tracer test with pulse injection may be characterized as passage of a material shock wave. Virtual transit is related to the maximum slope on the dimensionless time versus concentration curve. The plug point, which separates plug from non-plug flow, is located at the initial arrival of tracer for straight rising or convex upward ascents, and (hypothetically) at the first tangential subinflectum of ogive ascents. Plug flow extends from the origin to the plug point, dual flow exists from the plug

point to the descending inflectum; beyond that flow is the mixed or eddied type. Short-circuiting is indicated directly by the distance between plug point and nominal detention time. The negative exponent of the semi-logarithmic plot of the decline denotes the number of times the effective fraction of basin volume is extracted by non-plug flow. Curves replotted from the literature confirm this theory. Dispersion is measured by the angle between the tangent to the plug point with the vertical. A concise diagram having plug point and dispersion as coordinates permits comparison of basins. (Knapp-USGS)

MEASURING SUBSURFACE SPRING FLOW WITH RADIOTRACERS,
Federal Water Pollution Control Administration, Dallas, Tex.; and Corps of Engineers, Tulsa, Okla. Engineering Div.
William C. Galegar, and Myron W. DeGeer.
ASCE Proceedings, Journal of the Sanitary Engineering Division, Vol 95, No SA6, Paper 6973, p 1097-1103, Dec 1969. 7 p, 4 fig, 2 ref.

Descriptors: *Tracers, *Tritium, *Groundwater movement, *Texas, *Springs, Streamflow, Tracking techniques, Leakage, Seepage, Water pollution sources, Brines, Saline water systems, Aquifers, Karst, Groundwater.
Identifiers: Estelline Spring (Tex).

A hydrostatic head was imposed on Estelline Spring, Texas to prevent surface discharge and subsequent natural salt pollution of the Red River. This paper describes the use of tritiated water as a tracer to determine the rate of subsurface leakage of the Spring, the size of the Spring cavern, and the location of that area where subsurface leakage returns to the surface. Other techniques using salt and organic dyes did not prove successful, due largely to insensitivity in detection and probable losses to adsorption and degradation. The volume of the known spring chimney, including that within the dike, amounts to about 389,800 cu ft. Knowing the amount of tracer added and the initial concentration of tracer after mixing, it was determined that a volume of 493,960 cu ft existed. From these data, it is concluded that a second chamber exists below that which was previously known; and its volume amounts to about 104,000 cu ft. (Knapp-USGS)
W70-02637

A FALLING-PARTICLE CURRENT METER,
Columbia Univ., Dobbs Ferry, N.Y. Hudson Labs.
T. E. Pochapsky.
Report avail from Clearinghouse as AD 679 195, $3.00 in paper copy, $0.65 in microfiche. Hudson Laboratories Technical Report No 151, Columbia University, May 1968. 22 p, 7 fig, 1 ref. Contract Nonr-266 (84) ONR.

Descriptors: *Current meters, *Instrumentation, *Ocean currents, Flow measurement, Gages, Currents (Water), Stream gages, Sea water, Velocity, Oceanography, Marine geology, Ocean circulation.
Identifiers: Falling-sphere current meter.

Small dense spheres sink in water with a predictable velocity. A horizontal current deflects the path of sinking and the magnitude of the current can be determined from the horizontal deflection. This procedure can be used to measure very small currents, particularly those below one cm/sec, which are too small to operate most current meters. A meter built to operate on this principle at sea is described. (Knapp-USGS)
W70-02670

A FLUOROMETRIC METHOD FOR DETERMINING TRACE QUANTITIES OF FLUORIDE,
Missouri Univ., Columbia. Dept. of Chemistry.
John C. Guyon, Berwyn E. Jones, and David A. Britton.
Mikrochimica Acta, Vol 6, p 1180-1184, 1968. OWRR Project A-014-MO.

Descriptors: *Analytical techniques, *Fluorescence, *Fluorides, *Ions, Chemistry, Trace elements.
Identifiers: Determination, Water samples, Anions.

A very selective method has been developed for the determination of ug quantities of fluoride based on the fluorescence quenching by fluoride of the zirconium-flavonol chelate. The fluorescence intensity is read at 460 nm. The reduction in fluorescence intensity caused by the fluoride is a measure of the fluoride concentration present.
W70-02726

A FLUOROMETRIC DETERMINATION OF IODIDE ION,
Missouri Univ., Columbia. Dept. of Chemistry.
David A. Britton, and John C. Guyon.
Microchemical Journal, Vol 14, No 1, p 1-6, Mar 1969. 2 tab, 2 fig, 2 ref. OWRR Project A-014-MO.

Descriptors: *Analytical techniques, Chemistry, *Fluorescence, *Ions, Trace elements.
Identifiers: Determination, Water samples, Anions, *Iodide ion.

A very selective, simple, sensitive fluorometric method for the determination of iodide ion was developed. The method is based on iodide quenching the fluorescence of an uranyl acetate solution. The fluorescence is measured at 520 mu. A nearly linear calibration curve is obtained for 2 to 20 ug of iodide ion.
W70-02727

FLUOROMETRIC DETERMINATION OF OXALATE ION,
Missouri Univ., Columbia. Dept. of Chemistry.
David A. Britton, and John C. Guyon.
Anal Chim Acta, Vol 44, p 397-401, 1969. 2 tab, 1 fig, 4 ref. OWRR Project A-014-MO.

Descriptors: *Analytical techniques, *Fluorescence, *Ions, Chemistry, Trace elements.
Identifiers: *Oxalate ion, Determination, Water samples, Anions.

A very selective, simple, sensitive fluorimetric method for the determination of oxalate ion is described. The method on the quenching by oxalate of the fluorescence of a 1:1 zirconium-flavonal chelate in dilute sulfuric acid solution. The fluorescence is measured at 460 nm. A linear calibration curve is obtained for 0-10 ug of oxalate ion; there are very few interferences.

ASCE Proc, J Hydraul Div, Vol 95, No HY6, Pap 6901, p 1993-2012, Nov 1969. 20 p, 10 fig, 2 tab, 7 ref, 4 append.

Descriptors: *Computer programs, *Data processing, *Hydrologic data, Open channel flow, Water resources, Digital computers, Groundwater movement, Hydraulics, Hydrology.
Identifiers: FORTRAN, ALGOL.

Computer programming, and particularly problem-oriented languages, useful in solving water resources engineering problems are reviewed. The original HYDRO language started by G. Bugliarello and associates, was written in ALGOL. At present about 70 computation procedures are available, principally in hydrology, and hydraulic engineering. A FORTRAN adaptation of this language, called FORTRAN-HYDRO (FH), was developed. FH consists of a system of interlocking FORTRAN IV subroutines that may be strung or looped within a standard FORTRAN IV program. A library of 45 standard computation procedures in Hydrology and in Open Channel Hydraulics is available, and is expected to be extended. FH may be implemented on any computer having a FORTRAN compiler, an internal memory of at least 32K, and a fast access auxiliary memory. It has been found useful for teaching hydrology, hydraulics and water resources engineering. Some further work may make it of value to the practitioner as well. Methods of extending the library of subroutines as well as ways of contributing to it are suggested. (Knapp-USGS)

HURRICANE CAMILLE TIDAL FLOODS OF AUGUST 1969 ALONG THE GULF COAST, KREOLE-GRAND BAY SW QUADRANGLES, MISSISSIPPI-ALABAMA,
Geological Survey, Washington, D.C.
K. V. Wilson, and James W. Hudson.
Geol Surv Hydrol Invest Atlas HA-407, 1 sheet, 1969. Text, 2 fig, 1 map, 1 tab, 3 ref

Descriptors: *Floods, *Mississippi, *Hurricanes, *Flood damage, *Coasts, *Tidal effects, Atmospheric pressure, Rain, Surges, Wind velocity, Winds, Disasters, Storms, Waves (Water), Water levels, Water level fluctuations, Inlets (Waterways), Sea level, Shores.
Identifiers: *Hurricane Camille (1969), Kreole (Miss), Grand Bay (Ala), Tidal floods, Storm tides.

The areas flooded by Hurricane Camille tides of August 18, 1969 along the Mississippi Gulf Coast are shown in a series of hydrologic atlases. The Atlas of the Kreole and Grand Bay, SW quadrangles show flooded areas on a topographic map scaled 1:24,000. Camille was the most intense hurricane on record to enter the U.S. mainland. Estimated maximum winds were 190 mph, and the central pressure was 26.61 inches of mercury. The eye

of the storm, traveling about due north, passed over the Waveland,Bay St. Louis area and winds of over 75 mph extended about 50 mi on each side. Maximum precipitation was 10 inches. Flooding was most severe in the Pass Christian area where tides reached 26 ft above msl. High tide frequency and annual maximum tide are shown by graphs. (K-napp-USGS)

CONSTRUCTION OF THE KRASNOYARSK RESERVOIR AND ITS SHORE DEVELOPMENT (RUSSIAN),
V. M. Shirokov.
In: Vodnye Resursy i Vodnoe Khozyaystvo Sibiri (Water Resources and Water Economy of Siberia). Akad Nauk SSSR, Sibirskoye Otdeleniе, Geogr Obshchestvo, Novosibirsk, USSR, p 9-16, 1968. 8 p, 1 fig, 1 tab, 5 ref.

Descriptors: Water resources development, *Reservoir construction, Reservoir operation,

*Bank stability, Shores, Water storage, Topography, Talus, Sediments, Floods, Frequency, Water levels.
Identifiers: *USSR, Krasnoyarsk Reservoir.

The dimensions and capacity of the proposed Krasnoyarsk reservoir of the Yorisei River are described and some forecasting pertaining to the development of its shoreline is given. The basic characteristics of this reservoir are as follows: the volume is 30 cubic kilometers, the area is 2100 square kilometers, the normal reservoir level is 243.0 m, and the level of 0.01% frequency flood is 244.2 m. It is believed that the presence of various types of rock outcrops in the reservoir areas and their topographical variations will considerably interfere with the formation of new shore slopes and shorelines. Institut d'Amenagement et d'Economie de l'Eau, Warsaw (Poland).
M. M. Zajbert.
Perma Int Asso of Navigation Congr, XXIInd Int Navigation Congr, Sect 1, Subj 6, Inland Navigation, p 139-156, Paris, 1969. 18 p, 15 fig.

Descriptors: *Retaining walls, *Construction, *Slabs, Navigable waters, Water pressure.

Pre-fabricated reinforced concrete slabs with parallel ribs have been developed to reduce wave height. The influence of the height, spacing and form of the ribs has been determined. The reduction in wave breaking height increases rapidly with the height of the ribs. The ribbed slab permits an economy in the use of concrete. Empirical formulae determine the dimensions at which the slab will be sufficiently resistant to pressure. The principal applications of this process in Poland are described. The article is written in French and includes an English summary. (Grossman-Rutgers)

SHORE EROSION AND PROTECTION ST. LAWRENCE RIVER-CANADA,
Department of Public Works (Canada).
C. K. Hurst, and Dr. A. Brebner.
Perma Int Asso of Navigation Congr, XXIInd Int Navigation Congr, Sect 1, Sub 6, Inland Navigation, p 45-56, Paris, 1969. 12 p, 16 fig, 1 tab.

Descriptors: *Bank erosion, Costs, Federal government, Local government, Navigation.
Identifiers: *Saint-Lawrence River.

With the increase in ocean traffic on the St. Lawrence and the parallel increase of industries and population along its banks, the problem of bank protection has become important. The costs of protecting the banks are borne by the governments. The Federal government bears the costs of erosion of the banks due to shipping; the local authorities pay the costs that result from natural erosion, effects of the current, and waves caused by wind or ice. The main cause of bank erosion is the passage of shipping. Measurements along the river indicate that the height of the waves and the lowering of the water level caused by shipping depend upon the velocity of the ships and the width of the channels. For rivers having a width under 2,000 feet, navigation is the main cause of bank erosion. For widths over 4,000 feet the effect of navigation on the banks is negligible. Arrangements on the distribution of expenditure have been made. The article is written in English and contains a French summary. (Grossman-Rutgers)

HISTORICAL, FIELD AND EXPERIMENTAL STUDIES OF THE SUEZ CANAL BANK PROTECTION,
Suez Canal Authority Research Center, Ismailia (Egypt); and International Commission for Irrigation and Drainage.
Dr. Eng. A. A. Ammar.
Perma Int Asso of Navigation Congr, XXIInd Int Navigation Congr, Sect 1, Subj 6, Inland Navigation, p 199-213, Paris, 1969. 15 p, 10 fig, 2 tab, 7 ref.

Descriptors: *Retaining walls, *Costs, Grading, Bank stability, Asphalt.
Identifiers: *Traffic capacity, Synthetic fabrics.

The objective is to protect at the lowest cost the banks of the canal against erosion caused by the return current and by the waves made by shipping. The paper describes the evolution of measures taken over the years to cope with increasing traffic. Tests have been carried out on the use of new materials: asphalt and synthetic fabrics. The choice of the type of revetment to be used should spring from a technical and economic study which takes into account the construction, maintenance and working costs of the navigable waterway, and also the working costs of the vessels using the waterway. The article is written in English and includes a French summary. (Grossman-Rutgers)

METHODS OF BANK PROTECTION FOR PORT, INLAND WATER-WAY AND RIVER,
Toa Harbour Works Co. Ltd., Tokyo (Japan). Engineering Dept.
Akira Katayama.
Perm Asso of Navigation Congr, XXIInd Int Navigation Congr, Sect 1, Subj 6, Inland Navigation, p 87-108, Paris, 1969. 2 p, 17 fig, 5 photo, 3 tab.

Descriptors: *Retaining walls, Navigable waters, Costs, Construction materials.
Identifiers: *Flexible mattress.

A recently developed method to avoid undermining of coastal or river bank structures is explained. This method consists in covering the foundation with a mattress made up of a series of synthetic material sacks filled with sand. This mattress is flexible and it adapts itself to foundation soil movements. The choice of synthetic material used must resist friction and ultra-violet rays. Several examples of the use of this method are given. The main features of this method are its rapidity of construction and low cost. The article is written in English and includes a French summary. (Grossman-Rutgers)

A STUDY OF FLOW CONDITIONS IN SHAFT SPILLWAYS,
Georgia Inst. of Tech., Atlanta. School of Civil Engineering.
Yusuf G. Mussalli, and M. R. Carstens.
Available from the Clearinghouse as PB-188 909, $3.00 in paper copy, $0.65 in microfiche. Water Resources Center, Georgia Institute of Technology, Report WRC-0669, Sept 1969. 158 p, 4 tab, 68 fig, 56 ref. OWRR Project B-022-GA.

Descriptors: *Spillways, *Vertical conduits, *Horizontal conduits, *Closed-conduit flow, *Closed conduits, *Flow control, *Weirs, Aeration, Air demand, Critical flow, Outlets, Turbulent flow, Aerated flow, Air entrainment, Weir control.
Identifiers: *Vertical shaft spillways, *Inclined-shaft spillways.

The purpose of the study was to develop data for design of vertical-and inclined-shaft spillways. A vertical shaft 4 inches square connected to a horizontal conduit by a 90-degree circular bend was used in the experiments. Studies were conducted using bend configurations of 3 different radii and various deflectors and with varying amounts of air admitted to the vertical shaft. The research demonstrates clearly the role of the bend curvature, deflector and air concentration on the phenomenon of sealing or transition to pipe control in the horizontal conduit. Sealing of the horizontal conduit depends on the Froude number of the flow. To maintain partly-full flow in the horizontal conduit, more air space is needed above the water flow area with an increase in Froude number. The water-flow area in the horizontal conduit with short-tube control is determined by the ratio of the radius of curvature along the centerline to the bend diameter and the deflector thickness at the crown. Ventilation of the horizontal conduit delays sealing and aeration of the water flow hastens sealing. With weir control, waves on the flow surface hasten sealing and highly aerated flow delays sealing. Ratios of radius of curvature along the centerline to the bend diameter larger than 2.0 are recommended, as bends of larger ratios generate less waves. (Conway-Georgia Tech)

EFFECT OF INTAKE ELEVATION AND OPERATION ON WATER TEMPERATURE,
Tennessee Valley Authority, Norris.
Walter O. Wunderlich, and Rex A. Elder
ASCE Proc, J Hydraul Div, Vol 95, No HY6, Pap 6917, p 2081-2091, Nov 1969. 11 p, 9 fig, 11 ref.

Descriptors: *Water temperature, *Reservoir operation, Stratification, Water resources development, Planning, Reservoir design, Water management (Applied), Water quality, Water quality control, Flood control, Simulation analysis, Thermodynamics.
Identifiers: Water temperature control, Reservoir thermodynamics.

A graphical temperature prediction method based on simplifying assumptions is used to demonstrate how intake elevation and operation at certain times of the year influence outflow water temperature during a yearly cycle of temperature stratification buildup and decay. Temperature predictions are made for 3 different intake elevations and 3 different years in which the hydrologic conditions require different reservoir operations. The method illustrates how intake elevation, reservoir operation and geometry, surface or bottom intake operation, inflow quantity and its annual distribution, inflow temperature, water surface elevation and climate influence outflow temperature. Additional applications are made to an existing reservoir to simulate a known operation and to check the reliability of the method. For the same reservoir, the outflow temperature of an assumed drastic operation change is predicted. The results show that dependent upon the combination of all factors, one and the same reservoir can produce a great variety of temperature patterns. (Knapp-USGS)

FLUCTUATING PRESSURES IN SPILLWAY STILLING BASINS,
Minnesota Univ., Minneapolis. Dept. of Civil Engineering; and Iowa State Univ., Ames. Dept of Engineering Mechanics.
C. Edward Bowers, and Frank Y. Tsai.
ASCE Proc, J Hydraul Div, Vol 95, No HY6, Pap 6915, p 2071-2079, Nov 1969. 9 p, 9 fig, 6 ref.

Descriptors: *Stilling basins, *Unsteady flow, *Hydraulic models, *Hydraulic jump, Turbulence, Vortices, Open channel flow, Spillways, Energy dissipation, Flow, Surges, Laboratory tests, Model studies.
Identifiers: *Stilling-basi n pressure fluctuations.

Experimental data are presented on fluctuating pressures in models of spillway stilling basins. Of special interest are data on (1) variation of pressure fluctuations with location in the basin, (2) variation of fluctuations with discharge, and (3) the growth of a pressure pulse as flow passes through the upstream portion of the hydraulic jump. Pressure fluctuations up to plus or minus 40% of the incident-velocity head were measured during the tests. (Knapp-USGS)

OPEN-CHANNEL SURGE SIMULATION BY DIGITAL COMPUTER,
Georgia Inst. of Tech., Atlanta. School of Engineering, and Harza Engineering Co., Chicago, Ill. Dept. of Hydraulics.
C. Samuel Martin, and Frank G. DeFazio.
ASCE Proc, J Hydraul Div, Vol 95, No HY6, Pap 6911, p 2049-2070, Nov 1969. 22 p, 23 fig, 1 tab, 12 ref, append.

Descriptors: *Open channel flow, *Surges, *Simulation analysis, Digital computers, Computer models, Hydraulics, Numerical analysis, Open channels, Waves (Water), Closed conduit flow, Hydrograph analysis, Unsteady flow.
Identifiers: Open channel surges.

The equations of motion for unsteady gradually-varied flow in open channels are expressed in a finite-difference form suitable for programming on a high-speed digital computer. The staggered-net scheme introduced by Stoker is expanded to be applicable to a system of N interconnected channels, with each of their ends subject to one of the following boundary conditions: discharge hydrograph, stage hydrograph, stage-discharge relationship, dead end or junction of channels. The theory and computer program are tested and compared with existing experimental results corresponding to the following situations: (1) Flood hydrograph in circular channel; (2) power-load rejection in headrace of trapezoidal canal; (3) power-load acceptance in tailrace of rectangular model channel; and (4) tidal (stage hydrograph) in rectangular model estuary. Because of good correlation between simulated and experimental results in all four instances and the ease of coding various problems, the staggered scheme of Stoker is strongly recommended for practicing engineers. (Knapp-USGS)

LOCAL SCOUR AROUND BRIDGE PIERS,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering
H. W. Shen, V. R. Schneider, and S. Karaki.
ASCE Proc, J Hydraul Div, Vol 95, No HY6, Pap 6891, p 1919-1940, Nov 1969. 22 p, 12 fig, 1 tab, 32 ref, append

Descriptors: *Scour, *Piers, Erosion, Stream erosion, Vortices, Turbulence, Eddies, Hydraulics, Sediment transport, Open channel flow, Steady flow, Bed load
Identifiers: Bridge pier scour

Local scour caused by the horseshoe vortex system which forms at the base of the piers is considered. Piers which induce a pressure field strong enough to cause the formulation of the horseshoe vortex system are termed 'blunt nosed', all others being classed as sharp-nosed piers. The condition of the sediment transported into and out of the scour hole forms the basis for the further classification of the scour process into clear-water scour and scour with continuous sediment motion. The pier Reynolds number is shown to be an important variable describing the strength of the horseshoe vortex system. Further, the equilibrium scour depth depends on the initial sediment transport condition for a steady uniform flow with fully developed bed material transport. Design criteria are proposed for blunt-nosed piers under the conditions of clear-water scour and scour with continuous sediment motion. Several deviations from the above ideal design conditions are discussed; methods for design in these cases are suggested. (Knapp-USGS)

COORDINATION IN MOBILE-BED HYDRAULICS,
Alberta Univ., Edmonton. Dept. of Civil Engineering.
Thomas Blench.
ASCE Proc, J Hydraul Div, Vol 95, No HY6, Pap 6884, p 1871-1898, Nov 1969. 28 p, 9 fig, 31 ref, append.

Descriptors: *Sediment transport, *Alluvial channels, *Open channel flow, *Mathematical models, Bed load, Hydraulics, Streamflow, Model studies, Reviews, Research and development, Mathematical studies, Hydraulic models.
Identifiers: Mobile-bed hydraulics, Channel stabilization.

A mathematical study was made of bed-load transport in flumes, and two independent seven-dimensional functional relations among 'numerics' are established. The procedure was analogous to, but more complex than, producing the friction-factor diagram plot for Newtonian flow in uniform circular pipes. It is used to analyze the self-adjustment of natural channels and the transport of bed load in flumes. Different formulations are necessary to represent different flow, with transport phases advertised by different bed forms. Features of world data become apparent. Coordination of legitimately divergent formulas is seen to be necessary for an overall picture of the phenomena. Recommendations are made for improved cooperative international research covering the practically important range of independent variables. (Knapp-USGS)

MOVEMENT OF SAND IN TUNNELS,
Norges Tekniske Hoegskole, Trondheim. River and Harbor Lab.
Dagfinn K. Lysne.
ASCE Proc, J Hydraul Div, Vol 95, No HY6, Pap 6880, p 1835-1846, Nov 1969. 12 p, 6 fig, 2 tab, 9 ref, append.

Descriptors: *Sediment transport, *Closed conduit flow, *Model studies, Erosion, Open channel flow, Hydraulic models, Particle size, Particle shape, Turbulence, Sands, Gravels, Tunnels.
Identifiers: Tunnel sediment transport.

The movement of sand and finely crushed rock in tunnels is investigated. A basic assumption is that the amount of transported material per unit time is low. Two problems have been distinguished and dealt with: (1) The general aspect of sand movement in a horizontal tunnel and; (2) the conditions for uniform sand movement in tunnels with variable slope. An analysis, based on present information of erosion in open channels, leads to equations for (1) calculating limiting size of particles being moved, and (2) the variation of cross section necessary to maintain uniform sand transport in long tunnels with variable slope. Coefficients are determined on the basis of laboratory tests and field data. (Knapp-USGS)
W70-02465

THE INTERPRETATION OF INTERFERENCE TESTS IN NATURALLY FRACTURED RESERVOIRS WITH UNIFORM FRACTURE DISTRIBUTION,
Atlantic Richfield Co., Dallas, Tex.
H. Kazemi, M. S. Seth, and G. W. Thomas.
Society of Petroleum Engineers Journal, Vol 9, No 4, p 463-472, Dec 1969. 10 p, 2 fig, 18 ref, 2 append.

Descriptors: *Drawdown, *Flow, *Mathematical models, *Porous media, *Permeability, Fractures (Geology), Pores, Transmissivity, Pumping, Well spacing, Withdrawal.
Identifiers: Double-porosity drawdown calculation, Interference tests.

The double-porosity model of Warren and Root for examining pressure drawdown and buildup phenomena in naturally fractured reservoirs has been extended to interpret interference test results. Both analytical and numerical solutions are presented. The practicality of some of the assumptions in the Warren-Root model was also investigated. The effects of well spacing and the magnitude of the interporosity flow parameter are briefly discussed. Another procedure for interpreting interference tests in naturally fractured reservoirs employs an equivalent homogeneous reservoir model, which is inadequate for early time responses, but for late time responses it yields favorable results. AN INVESTIGATION OF THE FLOW REGIME FOR HELE-SHAW FLOW,
Shell Development Co., Houston, Tex., and Purdue Univ., Lafayette, Ind.
R. C. Smith, and R. A. Greenkorn.
Society of Petroleum Engineers Journal, Vol 9, No 4, p 434-442, Dec 1969. 9 p, 7 fig, 7 ref, append. Grant No 1797-A2, (Amer Chem Soc Petrol Res Fund)

Descriptors: *Flow, *Porous media, *Darcy's law, *Hydraulic models, Mathematical studies, Reynolds number, Model studies, Laboratory tests, Steady flow, Groundwater movement
Identifiers: *Hele-Shaw models.

Hele-Shaw cells are used to model creeping flow through porous media (where Darcy's law is valid). The effects of inertia on flow about obstructions in a Hele-Shaw cell can be calculated by a perturbation method by determining a solution to Laplace's equation. Results of a computer solution for flow about circular, square and elliptical obstructions are presented. For a modified Reynolds number of less than 1, the inertia terms are small; and for values of less than 3, the average streamline predicts the ideal flow. The analogy should be useful for studying flow in porous media up to a modified Reynolds number of at least 3. (Knapp-USGS)

PLANNING FOR POWER - A LOOK AT TOMORROWS STATION SIZES,
Ebasco Services, Inc.
R. R. Bennett.
IEEE Spectrum, Vol 6 (9), p 67-72, 1968. 4 fig.
Identifiers: *Electrical system design, *Power growth surveys, *Systems engineering, *Turbine-generators, Air pollution, Boiling-water reactors, Cooling towers, Fossil fuels, Reactor siting, Single-purpose plant, Breeder reactors.

Predictions of the sizes of electric power generating stations for the year 1987 were made by superimposing the effects of availability of cooling water, availability of fuel, environmental limitations, electric system limitations, component design, manufacture, and shipment limitations, and land requirements on projections of the historical trends in load growth, unit size, and station size. U.S. peak electrical loads increased from 60,000 MW (E) to 225,000 MW (E) between 1947 and 1967 and are estimated to increase to 900,000 MW (E) in 1987. The average unit size increased from 38 MW (E) in 1947 to 280 MW (E) in 1967, the largest unit size increased from 100 MW (E) to 1000 MW (E), the average station size increased from 34 MW (E) to 200 MW (E), and the largest station size increased from 880 MW (E) to 1950 MW (E). For the year 1987 the largest unit size is predicted to be 3000 MW (E) and the largest station size 12,000 MW (E), the average unit size is predicted to be 1500 MW (E) and the average station size 4000 MW (E).

OOLITIC ARAGONITE AND QUARTZ SAND: LABORATORY COMPARISON UNDER WAVE ACTION,
Army Coastal Engineering Research Center, Washington, D.C.
Frederick F. Monroe.
Available without charge from US Army Coastal Engineering Research Center, 5201 Little Falls Road, N.W., Washington, DC, 20016. Corps Engineers Coastal Engineering Research Center Miscellaneous Paper No 1-69, Apr 1969. 84 p, 58 fig, 5 tab, 7 ref, 3 append.

Descriptors: *Quartz, *Sands, *Carbonate rocks, *Sediments, *Erosion, *Laboratory tests, Waves (Water), Particle size, Beaches, Beach erosion, Coastal engineering, Test procedures, Fluorescence, Cost comparisons.
Identifiers: *Oolitic aragonite, Quartz sand, Beach nourishment.

The use of oolitic aragonite as a suitable beach fill material was investigated in laboratory tests and field studies. Results of the field study proved inconclusive but the laboratory tests show oolitic aragonite to be a suitable material hydraulically for beach nourishment if it can be placed on the beach at a cost competitive with other sand sources, and if the energy environment of the beach does not require a larger size material than in the oolitic aragonite. Detailed description of analytical procedures and many curves depicting the results of the studies are given. (Gabriel-USGS)

INVESTIGATION OF SOIL FREEZING,
Rhode Island Univ., Kingston. Dept. of Civil Engineering.
Wang Mian Chang.
PB-188 907. Technical Completion Report, Rhode Island Water Resources Center, 1969. 51 p, 1 tab, 28 fig, 19 ref. OWRR Project A-023-RI.

Descriptors: *Frost action, *Heave, Heat flow, Moisture migration, *Compacted soils.
Identifiers: *Soil freezing.

Study on the effect of some important factors on such frost behaviors of compacted soils as the rate and depth of frost penetration, water content increase and frost heaving is described. The factors investigated are the degree of saturation, molding water content, dry density and soil textures. The apparatus used included a cold chest, a reflecting type galvanometer and copper-constantan themocouples, a set of one thousandth inch dial gages and an X-ray machine. The experimental results show that increasing initial degree of saturation (for a constant dry density), decreasing dry density (for a constant degree of saturation), and decreasing the percentage of fine grain (0.002 mm.) content will decrease the rate of frost penetration, and that decreasing initial degree of saturation, increasing dry density and the percentage of fine grain content will decrease overall frost heaving. Frost heaving of soils compacted using a constant compaction effort, however, increases with increasing molding moisture content regardless of the change of dry density.

DYNAMIC BEHAVIOR OF SOIL,
Rhode Island Univ., Kingston. Dept. of Civil Engineering; and Rhode Isand Univ., Kingston. Dept. of Ocean Engineering.
Vito A. Nacci.
PB-188 904. Technical Completion Report, Rhode Island Water Resources Center, 1969. 45 p, 23 fig, 38 ref. OWRR Project A-016-RI.

Descriptors: *Elastic wave propagation, *Shear modulus, *Silt.
Identifiers: Anisotropy, *Stress-strain.

Investigation concerning the dynamic shear modulus of silt sedimented at different degrees of anisotropy are described. The influence of confining pressure and amplitude of vibration on the shear modulus was investigated. The resonant column method under fully saturated conditions was used to study the effects of the various parameters. The results show that the shear modulus of normally consolidated silt varies as the 7/10th power of the confining pressure. The modulus is also greatly influenced by strata orientation and void ratio. At relatively small amplitudes of vibration, less than 10-5 radians, the shear modulus is constant and can be considered to be the elastic dynamic shear modulus of the soil.

SIMULTANEOUS DETERMINATION OF BASIC GEOMETRICAL CHARACTERISTICS OF POROUS MEDIA,
Instituto Mexicano del Petroleo, Mexico.
Candelario Perez-Rosales.
Society of Petroleum Engineers Journal, Vol 9, No 4, p 413-416, Dec 1969. 4 p, 3 fig, 3 ref.

Descriptors: *Porous media, *Porosity, *Particle size, *Particle shape, *Permeability, Analytical techniques, Interstices, Pores, Void ratio, Voids, Laboratory tests.
Identifiers: Pore geometry.

A statistical method for determining simultaneously some of the basic geometrical characteristics of porous media such as porosity, specific surface, mean pore width, mean grain thickness and absolute permeability is presented. The proposed method is characterized by its simplicity and the minimum amount of laboratory equipment that it requires. The experimental procedure used is based upon the surface analysis of a sample. In view of this fact the applicability of the method is limited to homogeneous and isotropic materials. (Knapp-USGS)

SALT WATER CORROSION CONTROL BY ENVIRONMENT MODIFICATION,
Dow Chemical Co., Freeport, Tex. Texas Div.
Robert A. Legault.
Available from the Superintendent of Documents, US Government Printing Office, Wash DC, 20402, for $1.25 per copy. Office of Saline Water, Research and Development Progress Report No 438, Apr 1969. 116 p. OSW Contract 14-01-0001-1482.

Descriptors: *Corrosion control, *Inhibitors, *Desalination, *Deaeration, Water-treatment.
Identifiers: *Dissolved-oxygen, Pitting, Chromates, Phosphates.

This study was concerned with corrosion control through environment modification without regard to the possible contamination of product water or the possible production of a toxic desalination plant effluent by an additive. If a particular additive performs satisfactorily as a corrosion inhibitor, the elimination of any contamination can be studied as a separate problem. The efficient exclusion of dissolved oxygen from sea water will permit the use of mild steel in this environment at a temperature of 250 deg F. Contamination of the sea water with traces of dissolved oxygen is sufficient to cause a localized attack that is prohibitive even at low corrosion rate values. Additionally, data obtained in this program indicate that: 5052 aluminum can be used without additives in desalination applications, and the presence of dissolved oxygen is not detrimental; the addition of 50 ppm of a binary phosphate-chromate inhibitor to the sea water makes it possible to use mild steel in desalination environments containing dissolved oxygen; the addition of 50 ppm of bicarbonate ion to the sea water makes it possible to use 1100 aluminum in desalination applications when the pH is adequately controlled; the addition of 100 ppm of chromate ion to the sea water makes it possible to use 1100 aluminum, as well as 3003, 5554, and 6061 aluminum, in desalination applications. ULTRASONIC DETECTION OF CALCIUM SULFATE SCALE ON METAL SURFACES,
Midwest Research Inst., Kansas City, Mo.
Fred R. Rollins, Jr.
Available from the Superintendent of Documents, US Government Printing Office, Wash DC, 20402, for $0.50 per copy. Office of Saline Water, Research and Development Progress Report No 444, June 1969. 39 p. OSW Contract 14-01-0001-1718.

Descriptors: *Scaling, *Calcium sulfate, *Ultrasonics, Heat transfer.
Identifiers: *Scale deposition, *Ultrasonic detection.

A study of ultrasonic reflectivity at liquid-metal interfaces where CaSO4 scale is also present has led to a technique which should be very useful for fixed-station scale detection in saline water conversion plants. The technique utilizes small high-t emperature transducers that can be soldered directly to the outside surface of heat-transfer tubes. The geometry is such that the ultrasonic beam produced by these transducers converges to a focal point along the center line of the heat-transfer tube, and then diverges to strike the opposite wall at normal incidence. With suitable electronic gear, the system provides nearly exponentially decaying echo trains at frequencies from a few megahertz up to 20 MHz. These echo trains remain remarkably stable at water temperatures as high as 280 deg F and flow velocities of 3 ft/sec. The decay rate of the echo train is strongly affected by the presence of scale on the inside surfaces of the heat transfer tube. The sensitivity of the technique for scale detection increases with increased frequency; but other problems, such as attenuation by the water, ultimately set an upper limit on a practical frequency. The decay rate also depends on the exact nature of the scale. For this reason, the current program did not establish an exact calibration, but the technique appears to be completely capable of detecting deposits with thicknesses of 1 mil or more. Further study and development should set a lower limit for detection of well below 1 mil. (Filban-Office of Saline Water)

Descriptors: *Copper alloys, *Dissolved oxygen, *Deaeration, Corrosion, Pitting, Dissolved oxygen analyzers.
Identifiers: Electrochemical corrosion rate, Weight-loss measurements, pH.

A small, highly automated pilot plant which could simulate most of the water conditions encountered in a distillation plant was constructed. Coupon weight losses of selected metals were then determined under the variables of dissolved oxygen concentration, pH, temperature, velocity, and water replenishment rate. The program thus far has progressed through the copper alloy family of 90-10 CuNi (706), 70-30 CuNi (715), 60-40 CuNi (720), Aluminum Brass (687), Ars. Admiralty Brass (443), and Phos. Deoxidized Copper (122). All alloys show extremely low weight loss under low dissolved oxygen conditions. (Filban-Office of Saline Water)

EFFECT OF SURFACE POTENTIAL ON SCALE FORMATION,
TRW Systems Group, Redondo Beach, Calif.
B. D. Marcus, H. P. Silverman, and W. T. Isukamoto
Available from the Superintendent of Documents, US Government Printing Office, Wash DC, 20402, for $0.70 per copy. Office of Saline Water, Research and Development Progress Report No 393, Jan 1969. 79 p. OSW Contract 14-01-0001-1447.

Descriptors: *Scaling, *Calcium sulfate, *Heat transfer, *Distillation desalination.
Identifiers: *Heat exchange surfaces, *Nucleation site, *Crystal growth, Radioisotope technique.

An experimental program was performed to investigate the effect of surface potential on the formation of calcium sulfate scale on platinum electrodes. The earliest stages of scale formation (nucleation), involving very small deposits of CaSO4, were of primary interest. Consequently, extremely sensitive radioisotope techniques were used for the basic measurements. Supersaturated calcium sulfate solutions were prepared in a temperature-controlled vessel by mixing S35-labelled H2SO4 with a Ca (OH)2 slurry. Five clusters of five carefully prepared platinum electrodes (25 in all) were then immersed in this solution and held at various potentials for pre-determined periods of time. After immersion the electrodes were removed, rinsed of excess radioactive solution and dried. They were then counted for radioactivity (S35 decays by emission of a 0.167 MeV B-particle). The count rate was proportional to the total mass of CaSO4 deposited on a given area of electrode. After counting them, the electrodes were autoradiographed yielding a map of the number and distribution of scale deposits on the surface. Results of multiple experiments were compared in order to achieve a sufficiently large body of data for statistical significance. It was demonstrated that surface potential is indeed a pertinent variable in scale formation. (Filban-Office of Saline Water)

DEVELOPMENT OF A LOW-COST IRON-BASE ALLOY TO RESIST CORROSION IN HOT SEA WATER,
Westinghouse Electric Corp., Pittsburgh, Pa.
N. Pessall, F. C. Hull, and C. Liu.
Available from the Superintendent of Documents, US Government Printing Office, Wash DC, 20402, for $0.70 per copy. Office of Saline Water Research and Development Progress Report No 478, Sept 1969. 76 p. OSW Contract 14-01-0001-1828.

Descriptors: *Corrosion, *Pitting resistance, *Desalination, *Alloys, Metallurgy.
Identifiers: *Iron alloys, *Anodic polarization, Critical pitting potential, Multicomponent ferritic steel.

Iron-base alloys, ranging from binary alloys of Fe-Cr to multicomponent alloys based on Fe-Cr-Mo, have been prepared by levitation melting. The relative resistances of the alloys to pitting corrosion in deaerated synthetic sea water, at temperatures up to 250 deg F, have been evaluated on the basis of critical pitting potentials, Ecrit, obtained from anodic polarization measurements. Based on studies of synergistic interactions, the most promising ferritic steels for use in aqueous chloride environments have been found in the Fe-Cr-Mo-Co alloy system. A tentative correlation between Ecrit and d-shell character of the component elements of quaternary alloys based on Fe-Cr-Mo suggests that multi-component ferritic steels, containing Cr and Mo as major additives in combination with small concentrations of Mn, Co, Ni, and/or Cu, will have exceptionally high resistance to pitting attack in aqueous chloride media. EVALUATION OF TITANIUM-PLATED STEEL IN A CHLORIDE ENVIRONMENT,
Solar, San Diego, Calif.
R. V. Warnock, and A. R. Stetson
Available from Superintendent of Documents, US Government Printing Office, Washington, DC 20402 for $0.70 per copy. Office of Saline Water, Research and Development Progress Report No 395, Jan 1969. 68 p. OSW Contract 14-01-0001-1441.

Descriptors: *Desalination, *Titanium, *Protective coatings, Pitting, Corrosion control.
Identifiers: *Titanium plating, *Plated low-carbon steels, *Fused salt plating, Electrolytic coating.

Deposition of titanium coatings on low-carbon steels was accomplished by both electrolytic and nonelectrolytic techniques. Two chemical systems (K2TiF6-NaF-LiF and K2TiF6-KF-LiF) were investigated and a 5 mole percent K2TiF6- eutectic NaF-LiF bath was selected for coating the majority of corrosion test specimens. Nonelectrolytic coatings were deposited at 1700 deg F and electolytic coatings were applied at 1550 deg F and 1.0 ampere/inch sq current density. The surface concentration of the 0.003-inch thick coatings was 95 percent or greater titanium and 5 percent or less iron. Boiling sea water, aerated, room temperature sea water, autoclave (280 deg F) and velocity effects corrosion tests showed the nonelectrolytic 0.003-inch thick coating to possess a corrosion resistance essentially equal to that of pure (A-70) titanium. The rate of coating deposition was found to be of prime importance in determining corrosion resistance because the deposition rate largely controls the coating composition (alloy versus intermetallic compound). (Filban-Office of Saline Water)
W70-02741

DEVELOPMENT OF A LOW-COST IRON-BASE ALLOY TO RESIST CORROSION IN HOT SEA WATER,
Westinghouse Electric Corp., Pittsburgh, Pa.
N. Pessall, F. C. Hull, N. Michael, and C. Liu.
Available from the Superintendent of Documents, US Government Printing Office, Washington, DC, 20402, for $0.75 per copy. Office of Saline Water, Research and Development Progress Report No 394, Jan 1969. 79 p. OSW Contract 14-01-0001-1447.

Descriptors: *Desalination, *Iron alloys, *Corrosion control, *Electrochemistry, Crystallography, Pitting.
Identifiers: *Iron-base alloys, *Anodic polarization, Critical potential, Passivation.

Iron-base alloys, ranging from binary alloys to multi-component alloys, containing as many as eleven different components have been prepared by levitation melting. Dynamic loop-tests at 250 deg F in deaerated sea water, as well as studies of anodic polarization curves carried out at room temperature in deaerated 0.1N NaCl solution, have been used to evaluate the relative corrosion behavior of the alloys. The investigations have indicated minimal effects of melting practice, processing procedure, and crystallographic texture on the corrosion of iron-base alloys in hot sea water. Based on the observation of synergistic alloying effects in Fe-Cr and Fe-Al alloys, future development of new corrosion resistant iron-base alloys is likely to be based on multi-component single phase alloys containing chromium and/or aluminum as major alloying components. Additions of

Co, Mo, Ni, Nb, Si, W, Ag, Zr, V, and Ti have all shown beneficial effects as alloying elements. A comparison of polarization measurements with loop-test data has indicated that, with certain precautions, the electrochemical method is to be preferred when evaluating new iron-base alloy compositions. W70-02500 02H

ALGAL GROWTH
ALGAL GROWTH ASSESSMENTS BY FLUORESCENCE TECHNIQUES,
W70-02777 05A

ALGAL GROWTH POTENTIAL
BATCH ASSAYS FOR DETERMINATION OF ALGAL GROWTH POTENTIAL,
W70-02778 05A

ALKALINITY
ALKALINITY BUDGET OF THE COLUMBIA RIVER,
W70-02642 02K

NUTRIENT-PHYTOPLANKTON RELATIONSHIPS IN EIGHT SOUTHERN ONTARIO LAKES,
W70-02795 05C

ALLOYS
DEVELOPMENT OF A LOW-COST IRON-BASE ALLOY TO RESIST CORROSION IN HOT SEA WATER,
W70-02693 08G

ALLUVIAL CHANNELS
FRICTION FACTORS FOR FLOW IN SAND-BED CHANNELS,
W70-02461 02J

COORDINATION IN MOBILE-BED HYDRAULICS,
W70-02463 08B

LATERAL MIGRATIONS OF THE ARKANSAS RIVER DURING THE QUATERNARY-FOWLER, COLORADO, TO THE COLORADO-KANSAS STATE LINE,
W70-02475 02J

ALTERATION OF FLOW
BAER V BD OF COUNTY COMM'RS OF WASHINGTON COUNTY.
W70-02517 04C

ALUMINUM
VIRUS REMOVAL BY CHEMICAL COAGULATION,
W70-02767 05F

AMMONIA
PHYSICAL, CHEMICAL, BACTERIAL, AND PLANKTON DYNAMICS OF LAKE PONTCHARTRAIN, LOUISIANA,
W70-02766 05C

ANAEROBIC
ANAEROBIC DIGESTION I. THE MICROBIOLOGY OF ANAEROBIC DIGESTION (REVIEW PAPER),
W70-02603 05D

ANAEROBIC DIGESTION
FACTOR ANALYSIS AS AN AID IN AN ECOLOGICAL STUDY OF ANAEROBIC DIGESTION,
W70-02594 05D

THE EFFECT OF METHANE ANALOGUES ON METHANOGENESIS IN ANAEROBIC DIGESTION,
W70-02595 05D

THE METHANE FERMENTATION BETWEEN MESOPHILIC AND THERMOPHILIC TEMPERATURE RANGES,
W70-02597 05D

THE PROTEOLYTIC BACTERIA PRESENT IN THE ANAEROBIC DIGESTION OF RAW SEWAGE SLUDGE,
W70-02602 05D

ANAEROBIC FERMENTATION
THE METHANE FERMENTATION BETWEEN MESOPHILIC AND THERMOPHILIC TEMPERATURE RANGES,
W70-02597 05D

ANALOG COMPUTERS
ANALOG SIMULATION OF ACTIVATED SLUDGE SYSTEMS,
W70-02608 05D

ANALYTICAL TECHNIQUES
A FLUOROMETRIC METHOD FOR DETERMINING TRACE QUANTITIES OF FLUORIDE,
W70-02726 07B

A FLUOROMETRIC DETERMINATION OF IODIDE ION,
W70-02727 07B

FLUOROMETRIC DETERMINATION OF OXALATE ION,
W70-02728 07B

EFFECTS OF ACID MINE WASTES ON PHYTOPLANKTON IN NORTHERN ONTARIO LAKES,
W70-02792 05C

ANNUAL PLANTS
PHYTOSOCIOLOGICAL VARIATIONS IN FLORISTIC COMPOSITION OF THE VEGETATION IN THE ARID ZONE I. MONSOONAL VEGETATION OF THE ALLUVIAL PLAINS,
W70-02553 02I

ANODIC POLARIZATION
DEVELOPMENT OF A LOW-COST IRON-BASE ALLOY TO RESIST CORROSION IN HOT SEA WATER,
W70-02693 08G

W70-02742 08G

APPROPRIATION
THE LAW OF SURFACE WATER IN MISSOURI,
W70-02579 04A

W70-02581 04A

AQUATIC ALGAE
PHYTOPLANKTON POPULATIONS IN RELATION TO TROPHIC LEVELS OF LAKES IN NEW HAMPSHIRE, U.S.A.
W70-02772 05C

EFFECTS OF ACID MINE WASTES ON PHYTOPLANKTON IN NORTHERN ONTARIO LAKES,
W70-02792 05C

AQUATIC ANIMALS
CLADOCERAN FAUNAS ASSOCIATED WITH AQUATIC MACROPHYTES IN SOME LAKES IN NORTHWESTERN MINNESOTA,
W70-02789 02H

MEASURING ORGANIC MATTER RETAINED BY AQUATIC INVERTEBRATES,
W70-02790 05C

AQUATIC ENVIRONMENT
INTERPRETATION OF RADIONUCLIDE UPTAKE FROM AQUATIC ENVIRONMENTS,
W70-02786 05A

AQUATIC HABITATS
SOME EFFECTS OF CLEARCUTTING ON SALMON HABITAT OF TWO SOUTHEAST ALASKA STREAMS,
W70-02724 04C

A PRELIMINARY ECOLOGICAL SURVEY OF THE WATER RESOURCES AND LAND USE PATTERNS OF THE DISMAL SWAMP AREA OF VIRGINIA,
W70-02746 06G

AQUATIC MICROBIOLOGY
ECOLOGY OF SELECTED AQUATIC BACTERIA IN THE SNAKE RIVER,
W70-02762 05C

AQUATIC MICROFLORA
AN INVESTIGATION OF THE STRUCTURAL CHEMISTRY OF YELLOW ORGANIC MATTER IN FRESH WATER,
W70-02769 02K

AQUATIC PLANTS
CONSERVATION AND CONTROL OF AQUATIC PLANTS AND FISH.
W70-02838 04A

AQUEOUS SOLUTIONS
THERMODYNAMIC MIXING PROPERTIES OF NACL LIQUIDS,
W70-02627 02K

AQUIFERS
SALT-WATER ENCROACHMENT INTO AQUIFERS.
W70-02484 02L

COMBATING SALT-WATER ENCROACHMENT INTO THE BISCAYNE AQUIFER OF MIAMI, FLORIDA,
W70-02485 02L

SALT-WATER INTRUSION IN SOUTHEASTERN FLORIDA,
W70-02486 02L

W70-02508 02H

NATIONAL RIVERS AND HARBORS CONGRESS
REMARKS BY CONGRESSMAN WILLIAM C. CRAMER BEFORE THE 56TH ANNUAL CONVENTION, NATIONAL RIVERS AND HARBORS CONGRESS.
W70-02513 05G

NATURAL RECHARGE
OPTIMIZING SALVAGEABLE WATER RESOURCES IN A SEMI-ARID INLAND BASIN,
W70-02745 03C

NATURAL RESOURCES
MOUNTAIN AND DESERT LAKES IN SOUTHERN KAZAKHSTAN, THEIR RESOURCES AND METHODS OF ECONOMIC DEVELOPMENT,
W70-02564 02H

DEPARTMENT OF NATURAL RESOURCES.
W70-02584 06E

CONSERVATION OF NATURAL RESOURCES.
W70-02587 03D

NAVIGABLE RIVERS
INTERSTATE COMMERCE - NAVIGABLE RIVERS - INDUSTRIAL WASTE CLOGGING CHANNEL HELD NOT UNLAWFUL OBSTRUCTION - UNITED STATES V REPUBLIC STEEL CORP (7TH CIR 1959).
W70-02512 05G

STREAM BOUNDARIES.
W70-02523 06E

POWER OF BOARD OF COMMISSIONERS OF NAVIGATION TO LICENSE PILOTS.
W70-02817 06E

RIGHT TO RUN TUNNEL UNDER RIVER TO COAL MINE.
W70-02818 06E

NAVIGABLE WATERS
BRIDGES OVER NAVIGABLE WATERWAYS AND RAILROADS.
W70-02811 06E

RIVERS LAKES NAVIGABLE WATERS STATE JURISDICTION.
W70-02840 06E

NAVIGATION
INTERSTATE COMMERCE - NAVIGABLE RIVERS - INDUSTRIAL WASTE CLOGGING CHANNEL HELD NOT UNLAWFUL OBSTRUCTION - UNITED STATES V REPUBLIC STEEL CORP (7TH CIR 1959).
W70-02512 05G

NETHERLANDS
A DECADE, RESEARCH IN LAND AND WATER MANAGEMENT, 1957-1967,
W70-02495 06B

NETS
ARTIFICIAL PROPAGATION LICENSES AND SEINE LICENSES.
W70-02831 06E

NEUSE RIVER
CURRENT STUDY IN THE NEUSE RIVER AND ESTUARY OF NORTH CAROLINA,
W70-02760 02L

NEW JERSEY
DELAWARE RIVER JOINT TOLL BRIDGE COMMISSION.
W70-02547 04A

STATE V ARCHER.
W70-02834 04D

NEW YORK
PROTECTING LONG ISLAND AQUIFERS AGAINST SALT-WATER INTRUSION,
W70-02488 02L

FLOOD PLAIN INFORMATION OF SCAUAQUADA CREEK, IN THE TOWNS OF CHEEKTOWAGA AND LANCASTER, ERIE COUNTY, NEW YORK.
W70-02629 04A

WATER RESOURCES DEVELOPMENT BY THE U.S. ARMY CORPS OF ENGINEERS IN NEW YORK.
W70-02645 04A

FLOOD PLAIN INFORMATION OF CANANDAIGUA OUTLET IN THE COUNTIES OF ONTARIO AND WAYNE, NEW YORK.
W70-02667 04A

NEWFOUND LAKE
PHYTOPLANKTON FLORA OF NEWFOUND AND WINNISQUAM LAKES, NEW HAMPSHIRE,
W70-02764 05C

NITRATES
NITROGEN RELATIONSHIPS IN BIOLOGICAL TREATMENT PROCESSES--III. DENITRIFICATION IN THE MODIFIED ACTIVATED SLUDGE PROCESS,
W70-02607 05D

NITRIFICATION
ENUMERATION OF AUTOTROPHIC AMMONIUM-OXIDIZING BACTERIA IN MARINE WATERS BY A DIRECT METHOD,
W70-02507 07B

NITROGEN RELATIONSHIPS IN BIOLOGICAL TREATMENT PROCESSES--II. NITRIFICATION IN TRICKLING FILTERS,
W70-02604 05D

NITROGEN
NITROGEN RELATIONSHIPS IN BIOLOGICAL TREATMENT PROCESSES--III. DENITRIFICATION IN THE MODIFIED ACTIVATED SLUDGE PROCESS,
W70-02607 05D

SOLUBILITIES OF NITROGEN, OXYGEN, AND ARGON IN DISTILLED WATER,
W70-02701 02K

CONTRIBUTIONS TO THE KNOWLEDGE OF NITROGENOUS COMPOUNDS AND PHOSPHATE IN THE LAKE WATERS OF JAPAN,
W70-02788 05C

NUTRIENT-PHYTOPLANKTON RELATIONSHIPS IN EIGHT SOUTHERN ONTARIO LAKES,
W70-02795 05C

NONLINEAR FLOW(POROUS MEDIA)
NONLINEAR FLOW IN POROUS MEDIA,
W70-02464 02F

NORTH DAKOTA
GEOLOGY AND GROUNDWATER RESOURCES OF CASS COUNTY, NORTH DAKOTA PART 3,
W70-02675 02F

NUCLEAR FUEL
ANALYSIS OF TRACE ELEMENTS IN WATER,
W70-02768 05A

NUCLEAR MAGNETIC RESONANCE
PROTON MAGNETIC RESONANCE SPECTRUM OF POLYWATER,
W70-02617 01A

POLYWATER PROTON NUCLEAR MAGNETIC RESONANCE SPECTRUM,
W70-02618 01A

NUCLEAR POWERPLANTS
THERMAL DISCHARGES FROM LARGE NUCLEAR PLANT,
W70-02635 05B

NUCLEATION SITE
EFFECT OF SURFACE POTENTIAL ON SCALE FORMATION,

W70-02692 08G

NUISANCE ALGAE
OBJECTIONABLE ALGAE WITH REFERENCE TO THE KILLING OF FISH AND OTHER ANIMALS,
W70-02803 05C

NUTRIENT LIMITED GROWTH
KINETICS OF NUTRIENT-LIMITED GROWTH,
W70-02783 05C

NUTRIENT REQUIREMENTS
EFFECTS OF ACID MINE WASTES ON PHYTOPLANKTON IN NORTHERN ONTARIO LAKES,
W70-02792 05C

MINERAL NUTRITION OF PHYTOPLANKTON,
W70-02804 05C

NUTRIENT SOURCES
REPORT ON THE NUTRIENT SOURCES OF LAKE MENDOTA.
W70-02506 05B

NUTRIENTS
NUTRIENT LIMITATION OF SUMMER PHYTOPLANKTON GROWTH IN CAYUGA LAKE,
W70-02643 05C

KINETICS OF NUTRIENT-LIMITED GROWTH,
W70-02783 05C

CONTRIBUTIONS TO THE KNOWLEDGE OF NITROGENOUS COMPOUNDS AND PHOSPHATE IN THE LAKE WATERS OF JAPAN,
W70-02788 05C

PHOSPHORUS EXCRETION AND BODY SIZE IN MARINE ANIMALS MICROZOOPLANKTON AND NUTRIENT REGENERATION,
W70-02791 05C

NUTRIENT-PHYTOPLANKTON RELATIONSHIPS IN EIGHT SOUTHERN ONTARIO LAKES,
W70-02795 05C

OBSTRUCTION TO FLOW
INTERFERENCE WITH DRAINAGE FACILITIES.
W70-02526 04A

STREAM CLEARANCE, RECTIFICATION AND IMPROVEMENT.
W70-02827 04A

OBSTRUCTION TO NAVIGATION
MILL DAMS.
W70-02586 06E

OCEAN CURRENTS
A FALLING-PARTICLE CURRENT METER,
W70-02670 07B

OCEANS
DISCHARGE OF SEWAGE EFFLUENT FROM A LINE SOURCE INTO A STRATIFIED OCEAN,
W70-02714 05D

OIL SPILLAGE
STUDY OF EQUIPMENT AND METHODS FOR REMOVING OIL FROM HARBOR WATERS,
W70-02725 05G

OIL WASTES
STUDY OF EQUIPMENT AND METHODS FOR REMOVING OIL FROM HARBOR WATERS,
W70-02725 05G

ON SITE TESTS
COOLING WATER STUDIES AT ELECTRIC POWER STATION,
W70-02713 05B

ONTARIO
NUTRIENT-PHYTOPLANKTON RELATIONSHIPS IN EIGHT SOUTHERN ONTARIO LAKES,
W70-02795 05C

ON-SITE INVESTIGATIONS
STUDIES IN THE TECHNIQUES OF FIELD TRIALS IN RANGE LANDS I. SIZE, SHAPE AND ARRANGEMENT OF PLOTS,
W70-02551 03F

OOLITIC ARAGONITE
OOLITIC ARAGONITE AND QUARTZ SAND LABORATORY COMPARISON UNDER WAVE ACTION,
W70-02624 08E

OPEN CHANNEL FLOW
OPEN-CHANNEL SURGE SIMULATION BY DIGITAL COMPUTER,
W70-02459 08B

COORDINATION IN MOBILE-BED HYDRAULICS,
W70-02463 08B

FLOW BELOW DEEPLY SUBMERGED RECTANGULAR WEIRS,
W70-02472 02E

OPERATING DATA
PHOSPHATE REMOVAL AT FORT WORTH, TEXAS,
W70-02596 05D

OPERATIONS RESEARCH
OPERATIONS RESEARCH STUDY OF WATER RESOURCES DEVELOPMENT AND MANAGEMENT OF THE TUCSON BASIN,
W70-02680 06A

ORANGE COUNTY(CALIF)
PLANNING AND PROVIDING AN ADEQUATE SUPPLY OF WATER FOR ORANGE COUNTY, CALIFORNIA,
W70-02487 02L

THE CHALLENGE OF WATER MANAGEMENT ORANGE COUNTY WATER DISTRICT, CALIFORNIA,
W70-02489 02L

ORGANIC ACIDS
EFFECT OF YELLOW ORGANIC ACIDS ON IRON AND OTHER METALS IN WATER,
W70-02505 02K

ORGANIC ACIDS(YELLOW)
EFFECT OF YELLOW ORGANIC ACIDS ON IRON AND OTHER METALS IN WATER,
W70-02505 02K

ORGANIC COMPOUNDS
RESPIRATION CORRECTIONS FOR BACTERIAL UPTAKE OF DISSOLVED ORGANIC COMPOUNDS IN NATURAL WATERS,
W70-02641 05A

ORGANIC MATTER
INTERRELATIONS OF DISSOLVED ORGANIC MATTER AND PHYTOPLANKTON,
W70-02510 05C

MEASURING ORGANIC MATTER RETAINED BY AQUATIC INVERTEBRATES,
W70-02790 05C

ORGANIC NUTRIENTS
PHOSPHORUS BUDGETS OF LAKES SIDNEY LANIER AND HARTWELL, GEORGIA,
W70-02752 05G

OSMOTIC PRESSURE
EFFECTS OF EXTERNAL SALT CONCENTRATIONS ON WATER RELATIONS IN PLANTS. VI EFFECTS OF THE EXTERNAL OSMOTIC WATER POTENTIAL ON SOLUTE REQUIREMENT, SALT TRANSPORT KINETICS AND GROWTH RATES OF LEAVES,
W70-02566 02I

OSTRACODS
EFFECTS OF CHLORINATED HYDROCARBON INSECTICIDES ON THE FRESHWATER SEED SHRIMP,
W70-02679 05C

OUTLETS
DISCHARGE OF SEWAGE ON OR WITHIN LIMITS OF HIGHWAY.
W70-02545 06E

OXALATE ION
FLUOROMETRIC DETERMINATION OF OXALATE ION,
W70-02728 07B

OXIDATION
CHEMISTRY OF THE OXIDANT, FERRATE, ITS INTERACTION WITH SPECIFIC ORGANICS FOUND IN WASTE WATER,
W70-02738 05G

IRON AND MANGANESE REMOVAL FROM SMALL GROUNDWATER SUPPLIES,
W70-02755 05F

OXIGEST
KINETICS AND EFFLUENT QUALITY IN EXTENDED AERATION,
W70-02611 05D

OXYGEN
SOLUBILITIES OF NITROGEN, OXYGEN, AND ARGON IN DISTILLED WATER,
W70-02701 02K

ON THE RELATION BETWEEN THE OXYGEN DEFICIT AND THE PRODUCTIVITY AND TYPOLOGY OF LAKES,
W70-02799 02H

OXYGEN DEFICIT
ON THE RELATION BETWEEN THE OXYGEN DEFICIT AND THE PRODUCTIVITY AND TYPOLOGY OF LAKES,
W70-02799 02H

OXYGEN UPTAKE INHIBITIONS
CORRELATION OF STRUCTURE VS ACTIVITY OF POLLUTANTS OF FRESH WATER,
W70-02753 05C

OXYGENATION
EXPERIMENTAL PROBLEMS ASSOCIATED WITH THE TESTING OF SURFACE AERATION EQUIPMENT,
W70-02612 05D

OYSTERS
MISCELLANEOUS PROVISIONS (RELATING TO WATER).
W70-02544 05G

FISH AND GAME OYSTER GROUND LEASES.
W70-02591 06E

PACKAGE PLANT
KINETICS AND EFFLUENT QUALITY IN EXTENDED AERATION,
W70-02611 05D

PARTICLE SHAPE
SIMULTANEOUS DETERMINATION OF BASIC GEOMETRICAL CHARACTERISTICS OF POROUS MEDIA,
W70-02466 08G

PARTICLE SIZE
SIMULTANEOUS DETERMINATION OF BASIC GEOMETRICAL

CHARACTERISTICS OF POROUS MEDIA,
W70-02466 08G

PENALTIES(CRIMINAL)
POLLUTION OF DRINKING WATER.
W70-02522 05F

DISCHARGE OF SEWAGE ON OR WITHIN LIMITS OF HIGHWAY.
W70-02545 06E

FISH AND GAME OYSTER GROUND LEASES.
W70-02591 06E

PENNSYLVANIA
WATER CONSERVATION AND RECLAMATION FUND.
W70-02518 05G

SOIL PHYSICAL PROPERTIES
FILTRATION PROPERTIES OF THE SOIL OF THE MOUNTAINS ON THE NORTHERN SLOPE OF TRANSILIAN ALA TAU (RUSSIAN),
W70-02652 02G

SOIL STRUCTURE
FACTORS DETERMINING THE HYDRAULIC CONDUCTIVITY OF RED MEDITERRANEAN SOILS AND DERIVED TYPES,
W70-02558 02G

SOIL WATER MOVEMENT
INFILTRATION OF WATER INTO NONUNIFORM SOIL,
W70-02447 02G

ANALYSIS OF INFLITRATION INTO DRAINING POROUS MEDIA,
W70-02448 02G

FILTRATION PROPERTIES OF THE SOIL OF THE MOUNTAINS ON THE NORTHERN SLOPE OF TRANSILIAN ALA TAU (RUSSIAN),
W70-02652 02G

SOILS
FILTRATION PROPERTIES OF THE SOIL OF THE MOUNTAINS ON THE NORTHERN SLOPE OF TRANSILIAN ALA TAU (RUSSIAN),
W70-02652 02G

SEASONAL FREEZING AND ITS HYDROLOGICAL EFFECT UNDER THE CONDITIONS OF THE NORTHERN SLOPE OF THE TRANSILIAN ALA TAU (RUSSIAN),
W70-02653 02C

WATER REPELLENT SOILS A WORLDWIDE CONCERN IN MANAGEMENT OF SOIL AND VEGETATION,

W70-02686 04A

SOIL-WATER-PLANT RELATIONSHIPS
EFFECTS OF EXTERNAL SALT CONCENTRATIONS ON WATER RELATIONS IN PLANTS. VI EFFECTS OF THE EXTERNAL OSMOTIC WATER POTENTIAL ON SOLUTE REQUIREMENT, SALT TRANSPORT KINETICS AND GROWTH RATES OF LEAVES,
W70-02566 02I

DETERMINATIONS OF LEAF AND FRUIT WATER POTENTIAL WITH A PRESSURE CHAMBER,
W70-02568 02I

SOLUBILITY
SOLUBILITIES OF NITROGEN, OXYGEN, AND ARGON IN DISTILLED WATER,
W70-02701 02K

SOLUBILITY OF ATMOSPHERIC OXYGEN IN WATER,
W70-02702 02K

NEW TABLES FOR OXYGEN SATURATION OF SEAWATER,
W70-02704 01B

DETERMINATION OF DISSOLVED OXYGEN BY THE WINKLER METHOD AND THE SOLUBILITY OF OXYGEN IN PURE WATER AND SEA WATER,
W70-02705 02K

NEW MEASUREMENTS OF OXYGEN SOLUBILITY IN PURE AND NATURAL WATER,
W70-02712 02K

SORPTION
STUDY OF A DESIGN-OPTIMIZATION PROCEDURE FOR ION-EXCHANGE AND ADSORPTION COLUMNS,
W70-02687 03A

SORPTION PROCESSES
STUDY OF A DESIGN-OPTIMIZATION PROCEDURE FOR ION-EXCHANGE AND ADSORPTION COLUMNS,
W70-02687 03A

SOUTHWEST U
RANGE SEEDING PROBLEMS AND RESEARCH IN THE PINYON-JUNIPER WOODLAND TYPE OF SOUTHWESTERN UNITED STATES,
W70-02555 04D

SPAWNING STREAMS
SOME EFFECTS OF CLEARCUTTING ON SALMON HABITAT OF TWO SOUTHEAST ALASKA STREAMS,
W70-02724 04C

SPECIFIC HEAT
THE DETERMINATION OF THE ENGINEERING THERMO-PHYSICAL PROPERTIES OF SOLUTIONS CONTAINING DISSOLVED SOLIDS,
W70-02749 02K

SPECIFIC SURFACE
NITROGEN RELATIONSHIPS IN BIOLOGICAL TREATMENT PROCESSES--II. NITRIFICATION IN TRICKLING FILTERS,
W70-02604 05D

SPILLWAYS
A STUDY OF FLOW CONDITIONS IN SHAFT SPILLWAYS,
W70-02774 08A

SPRINGS
MEASURING SUBSURFACE SPRING FLOW WITH RADIOTRACERS,
W70-02637 07B

BRINE SPRINGS IN THE ZWICKAU-OELSNITZ COAL AREA (GERMAN),
W70-02673 05B

SPRINKLER IRRIGATION
SPRINKLER IRRIGATION SPRAY TEMPERATURES,
W70-02563 03F

STAGE-DISCHARGE RELATIONS
TRIANGULAR BROAD-CRESTED WEIR,
W70-02449 07B

STARVATION
INFLUENCE OF STARVATION ON SELECTED TEMPERATURE OF SOME SALMONIDS,
W70-02706 05C

STATE GOVERNMENTS
APPROPRIATION AND CONDEMNATION OF LANDS AND WATERS TO ENABLE COMPLETION OF AUTHORIZED PROJECTS.
W70-02529 06E

DEPARTMENT OF NATURAL RESOURCES.
W70-02584 06E

STATISTICAL METHODS
ATTAINABLE ACCURACY OF LINEAR STATISTICAL FORECASTING AND OPTIMAL DIMENSIONS OF THE PREDICTOR (RUSSIAN),
W70-02656 02B

STILLING BASINS
FLUCTUATING PRESSURES IN SPILLWAY STILLING BASINS,
W70-02457 08B

STILLING-BASIN PRESSURE FLUCTUATIONS
FLUCTUATING PRESSURES IN SPILLWAY STILLING BASINS,
W70-02457 08B

STORM RUNOFF
URBAN RUNOFF BY ROAD RESEARCH LABORATORY METHOD,
W70-02467 04C

STREAM MODELS
EVALUATION OF FACTORS AFFECTING STREAM SELF-PURIFICATION,
W70-02758 05G

STREAMFLOW
FLOODS IN MISSISSIPPI-SEPTEMBER 1965 THROUGH SEPTEMBER 1967,
W70-02621 02E

SOME ASPECTS OF THE EFFECTS OF THE QUANTITY AND QUALITY OF WATER ON BIOLOGICAL COMMUNITIES IN EVERGLADES NATIONAL PARK,
W70-02631 04C

IMPOUNDMENT INFLUENCES ON WATER QUALITY,
W70-02785 05G

STREAMS
STRUCTURAL CHARACTERISTICS OF BENTHIC ALGAL COMMUNITIES IN LABORATORY STREAMS,
W70-02780 05C

SOME EFFECTS OF CURRENT VELOCITY ON PERIPHYTON COMMUNITIES IN LABORATORY STREAMS,
W70-02794 05C

CLEAN STREAMS LAW.
W70-02832 05G

JURISDICTION OF COUNTIES ON BOUNDARY WATERS.
W70-02841 06E

STRESS-STRAIN
DYNAMIC BEHAVIOR OF SOIL,
W70-02751 08E

STRUCTURAL GEOLOGY
RELATION OF BEDROCK FRACTURE SYSTEMS TO UNDERGROUND WATER SUPPLIES IN THE STAFFORD SPRINGS, SOUTH COVENTRY, SPRING HILL, AND WESTFORD QUADRANGLES,
W70-02756 02F

STURGEON
CONSERVATION AND CONTROL OF AQUATIC PLANTS AND FISH.
W70-02838 04A

STURGEONS
WILDLIFE CONSERVATION.
W70-02835 06E

SUBMERGED FLOW
FLOW BELOW DEEPLY SUBMERGED RECTANGULAR WEIRS,
W70-02472 02E

SUBMERGED WEIRS
FLOW BELOW DEEPLY SUBMERGED RECTANGULAR WEIRS,
W70-02472 02E

SUBSURFACE DRAINAGE
DEVELOPMENT OF A MATHEMATICAL MODEL FOR THE SIMULATION OF FLATLAND WATERSHED HYDRAULICS,
W70-02676 02G

SUCCESSION
THE SUCCESSION OF 'BLOOM' SPECIES OF BLUE-GREEN ALGAE AND SOME CAUSAL FACTORS,
W70-02684 02H

SULFHYDRYL REACTIVITY
CORRELATION OF STRUCTURE VS ACTIVITY OF POLLUTANTS OF FRESH WATER,
W70-02753 05C

SULFHYDRYL-THIOL AFFINITY-RATE ASSAY
CORRELATION OF STRUCTURE VS ACTIVITY OF POLLUTANTS OF FRESH WATER,
W70-02753 05C

SULFUR BACTERIA
ECOLOGY OF SELECTED AQUATIC BACTERIA IN THE SNAKE RIVER,
W70-02762 05C

SUPERVISORY CONTROL(POWERS)
SCHUYLKILL RIVER POLLUTION.
W70-02828 05G

SUPERVISORY CONTROL(POWER)
OBSTRUCTIONS NOT TO BE MADE OR ALTERED WITHOUT CONSENT.
W70-02534 04A

SURFACE AERATORS
EXPERIMENTAL PROBLEMS ASSOCIATED WITH THE TESTING OF SURFACE AERATION EQUIPMENT,
W70-02612 05D

SURFACE DRAINAGE
PETITION TO COURT FOR DRAINAGE AND APPOINTMENT OF COMMISSIONERS.
W70-02520 04A

SURFACE RUNOFF
THE LAW OF SURFACE WATER IN MISSOURI,
W70-02578 04A

THE ROLE OF SOLID AND LIQUID PRECIPITATIONS IN RUNOFF FORMATION (RUSSIAN),
W70-02654 02C

GENERALIZED ANALYSIS OF SMALL WATERSHED RESPONSES,
W70-02763 02A

SURFACE WATERS
INDIRECT EVALUATION OF SOME CHARACTERISTICS OF A

HYDROLOGICAL REGIME OF RIVERS UNDER CONDITIONS OF EXCESSIVE MOISTURE (RUSSIAN),
W70-02482 02A

THE LAW OF SURFACE WATER IN MISSOURI,
W70-02577 04A

W70-02578 04A

W70-02581 04A

WATER IN THE KAHUKU AREA, OAHU, HAWAII,
W70-02623 03B

BIG BLACK RIVER, MISSISSIPPI COMPREHENSIVE BASIN STUDY - ANNEX F. GEOLOGY AND WATER RESOURCES,
W70-02672 02E

SURFACE-GROUNDWATER RELATIONSHIPS
THEORETICAL BASEFLOW CURVES,
W70-02460 02A

SURGES
OPEN-CHANNEL SURGE SIMULATION BY DIGITAL COMPUTER,
W70-02459 08B

SURVEYS
RIVER ICE JAMS - A LITERATURE REVIEW,
W70-02494 02C

SUSPENDED LOAD
SUSPENDED SEDIMENTS UNDER TURBULENT CONDITIONS (RUSSIAN),
W70-02481 02J

SWAMP
MEASUREMENT OF EVAPOTRANSPIRATION IN LOWLAND VEGETATION,
W70-02733 02D

SWAMPS
PUBLIC LANDS AND SWAMPS - SALES - PUBLIC USE.
W70-02588 04A

SYSTEMS ANALYSIS
AN EXAMINATION OF NONTREATEMENT PLANT ALTERNATIVES IN WATER POLLUTION CONTROL
W70-02695 05G

SYSTEMS ENGINEERING
STOCHASTIC BASIS FOR COMPREHENSIVE RIVER BASIN PLANNING PHASE I,
W70-02681 06A

PLANNING FOR POWER - A LOOK AT TOMORROWS STATION SIZES,
W70-02740 08C

TAXES
FLOOD CONTROL.
W70-02576 04A

TECHNICAL FEASIBILITY
MEMBRANE FILTER-FLUORESCENT-ANTIBODY METHOD FOR DETECTION AND ENUMERATION OF BACTERIA IN WATER,
W70-02782 05A

TECHNIQUE
MEMBRANE FILTER-FLUORESCENT-ANTIBODY METHOD FOR DETECTION AND ENUMERATION OF BACTERIA IN WATER,
W70-02782 05A

TECHNIQUES
ENUMERATION OF AUTOTROPHIC AMMONIUM-OXIDIZING BACTERIA IN MARINE WATERS BY A DIRECT METHOD,
W70-02507 07B

TEMPERATURE
ALKALI SACATON SEEDLINGS GERMINATION AND SURVIVAL IN AN AGAR AND SOIL MEDIUM,
W70-02685 04A

NEW TABLES FOR OXYGEN SATURATION OF SEAWATER,
W70-02704 01B

CONSIDERATIONS ON HYDRAULIC MODELS TO BE EMPLOYED TO STUDY RECIRCULATION INTAKE CONDITIONS OF COOLING WATER IN STEAM POWER STATIONS,
W70-02707 05B

THE EFFECT OF ELEVATED TEMPERATURES ON THE TREATMENT OF NORMAL DOMESTIC SEWAGE,
W70-02710 05D

NEW MEASUREMENTS OF OXYGEN SOLUBILITY IN PURE AND NATURAL WATER,
W70-02712 02K

TEMPERATURE CONTROL
SPRINKLER IRRIGATION SPRAY TEMPERATURES,
W70-02563 03F

TEMPERATURE SELECTION
INFLUENCE OF STARVATION ON SELECTED TEMPERATURE OF SOME SALMONIDS,
W70-02706 05C

TERTIARY TREATMENT
INFLUENCE OF PH ON THE ADSORPTION OF AROMATIC ACIDS ON ACTIVATED CARBON,
W70-02443 05G

TEXAS
MEASURING SUBSURFACE SPRING FLOW WITH RADIOTRACERS,
W70-02637 07B

THEORETICAL ANALYSIS
GROUND WATER SEEPAGE PATTERNS TO WELLS FOR UNCONFINED FLOW,
W70-02759 02G

THERMAL EFFLUENT MIXING
THERMAL DISCHARGES FROM LARGE NUCLEAR PLANT,
W70-02635 05B

THERMAL POLLUTION
THERMAL DISCHARGES FROM LARGE NUCLEAR PLANT,
W70-02635 05B

USE OF RIVER MODELS IN COOLING CIRCULATING WATER STUDIES,
W70-02709 05B

COOLING WATER STUDIES AT ELECTRIC POWER STATION,
W70-02713 05B

A HYDRAULIC MODEL STUDY OF HEAT DISSIPATION AT KINCARDINE POWER STATION,
W70-02717 05B

THERMAL POWER PLANTS
COOLING WATER STUDIES AT ELECTRIC POWER STATION,
W70-02713 05B

A HYDRAULIC MODEL STUDY OF HEAT DISSIPATION AT KINCARDINE POWER STATION,
W70-02717 05B

THERMAL STRATIFICATION
DENSITY FLOW REGIME OF ROOSEVELT LAKE,
W70-02716 02H

THERMODYNAMIC BEHAVIOR
THERMODYNAMIC MIXING PROPERTIES OF NACL LIQUIDS,
W70-02627 02K

THIOL AFFINITY-SULPHYDRYL-REACTIVE AGENTS
CORRELATION OF STRUCTURE VS ACTIVITY OF POLLUTANTS OF FRESH WATER,
W70-02753 05C

TIDAL EFFECTS
HURRICANE CAMILLE TIDAL FLOODS OF AUGUST 1969 ALONG THE GULF COAST, KREOLE-GRAND BAY SW QUADRANGLES, MISSISSIPPI-ALABAMA,
W70-02660 07C

HURRICANE CAMILLE TIDAL FLOODS OF AUGUST 1969 ALONG THE GULF COAST, BAY ST. LOUIS QUADRANGLE, MISSISSIPPI,
W70-02661 07C

HURRICANE CAMILLE TIDAL FLOODS OF AUGUST 1969 ALONG THE GULF COAST, GULFPORT NW QUADRANGLE, MISSISSIPPI,
W70-02662 07C

HURRICANE CAMILLE TIDAL FLOODS OF AUGUST 1969 ALONG THE GULF COAST, VIDALIA QUADRANGLE, MISSISSIPPI,
W70-02665 07C

HURRICANE CAMILLE TIDAL FLOODS OF AUGUST 1969 ALONG THE GULF COAST, WAVELAND-GRAND ISLAND PASS QUADRANGLES, MISSISSIPPI,
W70-02666 07C

TIDAL PRISM
CURRENT STUDY IN THE NEUSE RIVER AND ESTUARY OF NORTH CAROLINA,
W70-02760 02L

TIDAL WATERS
PROTECTION OF FISHING GROUNDS.
W70-02737 06E

TIMING
EXPRESSING IRRIGATION EFFICIENCY IN TERMS OF APPLICATION TIME, INTAKE AND WATER ADVANCE CONSTANTS,
W70-02556 03F

TITANIUM
EVALUATION OF TITANIUM-PLATED STEEL IN A CHLORIDE ENVIRONMENT,
W70-02741 08G

TITANIUM PLATING
EVALUATION OF TITANIUM-PLATED STEEL IN A CHLORIDE ENVIRONMENT,
W70-02741 08G

TOTAL COUNTS
THE EFFECTS OF RADIATION ON CHICAGO METROPOLITAN SANITARY DISTRICT MUNICIPAL AND INDUSTRIAL WASTES,
W70-02614 05D

TOXIC SUBSTANCES
THE EFFECT OF METHANE ANALOGUES ON METHANOGENESIS IN ANAEROBIC DIGESTION,
W70-02595 05D

TOXICITY
EFFECT OF BORON ON BIOLOGICAL WASTE TREATMENT,
W70-02734 05D

TRACE ELEMENTS
LEAD AND OTHER METAL IONS IN UNITED STATES PRECIPITATION,
W70-02444 05B

TRACE METALS
ANALYSIS OF TRACE ELEMENTS IN WATER,
W70-02768 05A

TRACERS
DESIGN PRINCIPLES OF WASTE STABILIZATION PONDS,
W70-02609 05D

BASIN TRACER CURVES INTERPRETED BY BASIC ANALYTICS,
W70-02633 07B

MEASURING SUBSURFACE SPRING FLOW WITH RADIOTRACERS,
W70-02637 07B

EVALUATION OF FACTORS AFFECTING STREAM SELF-PURIFICATION,

SELECTED WATER RESOURCES ABSTRACTS

LIBRARY

VOLUME 3, NUMBER 8
APRIL 15, 1970

W70-02843 -- W70-03243

Selected Water Resources Abstracts is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the Clearinghouse for Federal Scientific and Technical Information (CFSTI) of the Bureau of Standards, U. S. Department of Commerce. It is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U. S. Department of the Interior, Washington, D. C. 20240. Annual subscription is $22.00 (domestic), $27.50 (foreign), single copy price is $3.00. Certain documents abstracted in this journal can be purchased from the Clearinghouse at the prices indicated in the entry. Prepayment is required.

VOLUME 3, NUMBER 8
APRIL 15, 1970

W70-02843 -- W70-03243

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources. WRSIC is not presently prepared to furnish loan or retention copies of the publications announced.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas. Centers, and their subject coverage, now in operation are:

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.

- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the FWPCA, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

In cooperation with the Federal Water Pollution Control Administration, the following "centers of competence" have been established:

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.
- Water quality requirements for freshwater and marine organisms at the College of Fisheries of the University of Washington.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

LIBRARY

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

INVENTORY OF SPRINGS IN THE MOREY PEAK AREA OF CENTRAL NEVADA,
Geological Survey, Denver, Colo.
J. D. Larson, and J. E. Weir, Jr.
Geol Surv Open-file Report, Nov 1969. 22 p, 8 fig, 2 tab, 4 ref. AEC Contract AT (29-2)-474.

Descriptors: *Springs, *Discharge (Water), *Nevada, Groundwater, Water resources, Stock water, Domestic water, Water quality, Water temperature, Data collections, Hydrologic data.
Identifiers: Morey Peak (Nevada).

About 90% of springs above 2,134 meters (7,000 feet) altitude in lat 38 deg 30 min-38 deg 45 min N. long 116 deg 15 min-116 deg 27 min W., in central Nevada were inventoried; 10 springs issue from local valley-fill material of Quaternary age and 12 springs from volcanic material of Tertiary age. Springs used for stock or domestic supplies were emphasized during the inventory. Analysis of water samples collected July 22-30, 1968, indicate that hardness ranges from 35 to 506 mg/l and dissolved-solids content ranges from 74 to 584 mg/l. Water discharges and temperatures were measured and ranged from 0.5 to 220 cu m per day, and from 6.5 deg to 25.0 deg C. Analysis of water samples collected Oct 11-14, 1968, indicate that hardness ranges from 23 to 477 mg/l and dissolved-solids content ranges from 108 to 694 mg/l. Water discharges and temperatures were measured and ranged from 0.5 to 65 cu m per day and from 6.0 deg to 16.0 deg C. (Knapp-USGS)

A PROGRAM IN URBAN HYDROLOGY. PART II: AN EVALUATION OF RAINFALL-RUNOFF MODELS FOR SMALL WATERSHEDS AND THE EFFECTS OF URBANIZATION ON RUNOFF,
Purdue Univ., Lafayette, Ind. School of Civil Engineering.
P. B. S. Sarma, J. W. Delleur, and A. R. Rao.
Available from the Clearinghouse as PB-189 043, $3.00 in paper copy, $0.65 in microfiche. Purdue University Water Resources Research Center Technical Report No 9. Oct 1969. 240 p, 58 fig. 30 tab, 105 ref, 3 append. OWRR Project B-002-IND.

Descriptors: *Urbanization, *Storm runoff, *Watersheds, Water yield, Runoff, *Rainfall-runoff relationships, Hydrographs, Rainfall, Runoff coefficient, *Time lag, *Model studies, *Simulation.
Identifiers: Nash model, Single linear reservoir model, Double routing, West Lafayette Watershed.

The data for this study were taken from four watersheds with varying degrees of urbanization located in West Lafayette, Indiana. The analytical approach adopted was the linear (time variant, lumped) system analysis. The conceptual linear systems considered in the analysis of the data were the single linear reservoir model, the double routing method, the Nash model, and the single linear-reservoir with linear-channel model. The single linear reservoir model was selected to simulate the rainfall-runoff process on small urban watersheds (less than 5 square miles) based on its superior regeneration performance while the Nash model served best on the larger watersheds (between 5 and 20 square miles). The relationship of the degree of urbanization and the time lag, the magnitude of the peak discharge, and the frequency of peak discharge were studied. Studies will be continued with linear models and, in addition, nonlinear models will be considered in the hydrologic simulation of the larger watersheds in order to develop design methods and criteria for predicting runoff from areas with varying degrees of urbanization.

A DISPERSION ANALOG MODEL FOR WATERSHED SYSTEMS,
Technion - Israel Inst. of Tech., Haifa.
M. H. Diskin.
Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 6, p 38-45, 1967. 8 p, 5 fig, 16 ref.

Descriptors: *Rainfall-runoff relationships, *Model studies, *Hydraulic models, *Analog models, Tracers, Runoff forecasting, Hydrograph analysis, Unit hydrographs, Dispersion, Simulation analysis.
Identifiers: *Rainfall-runoff models, Israel, Watershed models.

A watershed system may be simulated by means of a model consisting of a wide gravel covered channel or tray in which a steady flow of water is maintained. The water enters the channel at a number of points and leaves it at one outlet. The varying times of travel from various parts of the watershed are simulated in the model by imposing on it a velocity field, which is defined by the shape of the tray, by the arrangement of the gravel in the tray and by the arrangement of the points at which the steady inflow of water is introduced. Rainfall is simulated in the above model by injecting concentrated salt solution at the various parts of the watershed model or over its entire surface. Runoff is simulated by the concentration of salt in the water flowing out from the model. The concentration is continuously measured and its variation with time represents the outflow hydrograph. The responses to short duration inputs obtained in the various models tested were all positively skewed distribution in the form typical to instantaneous unit hydrographs from actual watersheds. The form of the impulse response depended on the extent and on the areal distribution of the incoming pulse. Simulation of short duration storms moving upstream or downstream in the model watersheds indicated significant changes in the form of the outflow hydrographs in comparison to a stationary storm of the same duration and rainfall. (Knapp-USGS)
W70-03128

A SIMULATED WATERSHED FLOW SYSTEM FOR HYDROGRAPH PREDICTION; A KINEMATIC APPLICATION,
Agricultural Research Service, Beltsville, Md. Hydrograph Lab.
D. L. Brakensiek.
Proceedings International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 3, p 18-24, 1967. 7 p, 3 fig, 1 tab, 6 ref.

Descriptors: *Rainfall-runoff relationships, *Routing, *Mathematical models, *Synthetic hydrology, Unit hydrographs, Runoff forecasting, Simulation analysis, Rainfall disposition, Streamflow forecasting.
Identifiers: Kinematic flow theory.

The upland watershed has generally been treated as a lumped system, that is, one in which graphs are predicted by the unit hydrograph theory or by a routing technique utilizing a reservoir storage analog. An upland watershed may be transformed into a one-dimensional flow system. Simple kinematic flow equations are utilized to route estimated rainfall excess. An example indicates that the computational system is feasible for predicting hydrographs. Hydrologic parameters of the watershed as a function of elevation can be introduced and evaluated as modifiers of the watershed hydrologic performance. (Knapp-USGS)

W70-03130

RUNOFF ANALYSIS AND WATER-BALANCE ANALYSIS BY A SERIES STORAGE TYPE MODEL,
National Research Center for Disaster Prevention, Tokyo (Japan).
Masami Sugawara.
Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 5, p 31-37, 1967. 7 p, 12 fig.

Descriptors: *Rainfall-runoff relationships, *Mathematical models, *Water storage, *Routing, Hydrograph analysis, Unit hydrographs, Rainfall intensity, Rainfall disposition, Evapotranspiration, Infiltration, Synthetic hydrology.
Identifiers: *Japan.

Storage type models are based on the hypothesis that both discharge and infiltration are functions of the amount of water stored in the ground, and which can be simulated approximately by a vessel having some outlets at the side and an outlet at the bottom. Although it can represent automatically the nonlinear character of the runoff phenomena, the storage model is not very sensitive to the precipitation intensity. The series storage model modifies this defect by using a vertical series of storage-type structures. This model gives good results in runoff analysis of Japanese rivers. Runoff structures of the river basins differ, but rivers in volcanic terraines have uniform large groundwater inflows, and their hydrographs are flat and smooth. The effect of soil moisture need not be considered in Japan where there is no dry season and the soil is nearly always wet. As the soil is always wet, we need not separate the actual evapotranspiration from the potential one. The runoff analysis of snowy basins is possible by dividing them into several zones. Though the series storage-type model gives good results for Japanese rivers, some modification must be necessary for the basins of nonhumid regions or of the regions where there is a half-year dry season. (Knapp-USGS)
W70-03131

ANALYTICAL SIMULATION OF WATERSHED HYDROGRAPHS FROM RAINFALL,
Agricultural Research Service, Beltsville, Md. Hydrograph Lab.
D. E. Overton.
Proceedings International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 2, p 9-17, 1967. 9 p, 2 fig, 20 ref.

Descriptors: *Rainfall-runoff relationships, *Routing, *Mathematical models, *Synthetic hydrology, *Runoff forecasting, Simulation analysis, Hydrologic budget, Rainfall disposition, Hydrographs, Unit hydrographs.
Identifiers: Hydrograph simulation.

Upland watershed hydrographs are usually estimated using unit hydrograph techniques. In view of the apparent vagaries of the unit hydrograph from storm to storm and the computational tedium involved in summations, new approaches are presented which may relieve these difficulties. The hydrologic reaction of the watershed is considered as a series of linear reservoirs in one approach and as a group of nonlinear reservoirs acting in parallel in another approach. Bases for estimation of the routing parameters are presented in an attempt to relate them to the physical characteristics of the watershed and the supply rate of the storm. (Knapp-USGS)
W70-03132

A DISTRIBUTED LINEAR MODEL FOR PEAK CATCHMENT DISCHARGE,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Land Research and Regional Survey.
Peter S. Eagleson.
Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 1, p 1-8, 1967. 8 p, 1 fig, 11 ref.

Descriptors: *Rainfall-runoff relationships, *Runoff forecasting, *Routing, *Rainfall disposition, Rainfall intensity, Peak discharge, Linear programming, Synthetic hydrology, Unit hydrographs, Mathematical models.
Identifiers: Kinematic wave theory.

The kinematic wave solution for surface runoff is used to obtain the contribution to peak discharge from an impulse of rainfall excess located at distance x from the catchment outlet. This spatial impulse response is employed in a linearization of the catchment dynamics to obtain a simple superposition relation for estimating the effect of areal variability in rainfall distribution upon the peak surface runoff. (Knapp-USGS)
W70-03133

A MATHEMATICAL WATERSHED ROUTING MODEL,
Minnesota Univ., St. Paul. Dept. of Agricultural Engineering.
R. E. Machmeier, and C. L. Larson.
Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 9, p 64-71, 1967. 8 p, 2 fig, 10 ref.

Descriptors: *Rainfall-runoff relationships, *Routing, *Mathematical models, *Streamflow forecasting, *Runoff forecasting, Simulation analysis, Computer models, Rainfall disposition, Rainfall intensity, Unsteady flow.
Identifiers: Watershed routing models.

A mathematical model of a 21.35-sq mi hypothetical watershed was developed. All of the channel characteristics are defined mathematically. Input to the watershed is rainfall excess of any selected rate and duration. The unsteady flow is routed through the channel system by the use of the partial differential equations of momentum and continuity in finite difference form. The watershed can be used to study the effects of supply rate and duration as well as physical characteristics of the watershed that effect the hydrologic process. (Knapp-USGS)

2B. Precipitation

A REVIEW OF PROJECT FOG DROPS,
Cornell Aeronautical Lab., Inc., Buffalo, N.Y.
Roland J. Pilie.
Report available from Clearinghouse for $3.00 in paper copy, $0.65 in microfiche. NASA Special Publication Report SP-212, Proceedings of Symposium held at NASA Headquarters, Wash, DC, p 1-23, Feb 6, 1969. 23 p, 12 fig, 1 tab, 7 ref.

Descriptors: *Fog, *Reviews, *Weather modification, Cloud physics, Atmospheric physics, Cloud seeding, Nucleation, Halides, Meteorology, Weather, Research and development.
Identifiers: Fog dispersal, Visibility, Fog physics.

A general review is given of a project to investigate basic warm fog properties and dynamics, and to evaluate suggested methods for suppression of warm fog. Investigations of basic fog properties included literature studies, fog modeling, fog climatologies, experimental investigations aimed at the description of fog, and studies of condensation nuclei that are activated to droplet growth in fog. These studies were all aimed at the development of a better understanding of what fog is, how it forms and why it creates a problem. (Knapp-USGS)
W70-02857

PROGRESS OF NASA RESEARCH ON WARM FOG PROPERTIES AND MODIFICATION CONCEPTS.

Report available from Clearinghouse for $3.00 in paper copy, $0.65 in microfiche. NASA Special Publication Report SP-212, Proceedings of Symposium held at NASA Headquarters, Wash, DC, Feb 6, 1969. 122 p, 44 fig, 6 tab, 14 ref.

Descriptors: *Fog, *Cloud seeding, *Reviews, Weather modification, Clouds, Nucleation, Silver iodide, Halides, Cloud physics, Meteorology, Weather, Airports.
Identifiers: Fog dispersal, Visibility, Airport operation.

A NASA symposium was held to review recent work in warm fog dispersal. Theoretical analyses and laboratory experiments were used to explore various warm fog modification concepts and catalog the noteworthy aspects of each concept. The seeding concept using sized hygroscopic nuclei was developed and tested in fog chamber experiments. The small amounts of the seeding material needed to significantly modify the fog and greatly increase visibility in these experiments were encouraging. The Symposium is a progress report, recognizing that there is work yet to be done before warm fog will no longer be an obstacle to routine aircraft operation. One objective was to provide results of recent warm fog seeding field experiments at the Chemung County Airport, Elmira, New York, and laboratory experiments at the Cornell Aeronautical Laboratory facility to evaluate several seeding materials. Another objective was to provide a forum for others to present and discuss their fog research programs and for aircraft users to define the operational needs of a practical fog modification system for airports. THE PRECIPITATION REGIME OF LONG ISLAND, NEW YORK,
Weather Bureau, Silver Spring, Md.
J. F. Miller, and R. H. Frederick.
Report available for sale from Superintendent of Documents, US Government Printing Office, Wash, DC, 20402. Geological Survey Professional Paper 627-A, p A1-A21, 1969. 21 p, 23 fig, 1 plate, 7 tab, 16 ref.

Descriptors: *Precipitation (Atmospheric), *Weather, *Climates, *New York, Hydrologic cycle, Rainfall, Synoptic analysis, Weather data, Data collections, Climatic data, Climatology, Meteorological data, Weather patterns.
Identifiers: *Long Island (NY).

Mean annual precipitation ranges from 40 to 50 inches over Long Island, New York and averaged about 43 inches for the analysis period 1951-65. The average precipitation is greatest over the central part of the Island. This may be due to (1) greater distance of this area from the stabilizing effects of the Atlantic Ocean and Long Island Sound, and (2) its slightly higher altitude. Average warm-season and cool-season precipitation are almost equal. The number of days with precipitation equal to or less than 1.00 inch is randomly distributed geographically but shows a definite seasonal variation, being greatest in the spring and least in the fall. The number of days with precipitation of more than 1.00 inch and the amount of rain that falls on such days are both highly correlated with average seasonal and monthly precipitation. About 5-10% of the water equivalent of cool-season precipitation is in the form of snow. (Knapp-USGS)

Cuchlaine A. M. King.
Arctic and Alpine Research, Vol 1, No 3, p 195-212, Summer 1969. 18 p, 11 fig, 2 tab, 16 ref.

Descriptors: *Glaciation, *Glaciers, *Geomorphology, *Arctic, *Sediments, Ice, Marine geology, Fjords, Mountains, Valleys, History, Mapping, Erosion, Rivers, Lakes, Deltas, Sea level, Stratigraphy.
Identifiers: *Canada, East Baffin Island, Glacial geomorphology.

Henry Kater Peninsula, East Baffin Island, was ice covered at least between 34,000 and 10,000 BP. The ice advanced into the sea along the outer part of the peninsula, spreading a thin morainic covering over shell-bearing marine sediments. Ice moved inland from the fjords along the margins of the peninsula, while ice from inland covered the interior. Much ice decayed in situ, leaving extensive dead-ice areas. The sea was relatively high as the ice withdrew. Deglaciation took place about 10,000 BP at the outer coast, about 8,500 BP in Isabella Bay on the north side, and 8,000 BP in Itirbilung Bay on the south side. The last major incursion of fjord ice into the embayments along the inner peninsula was approximately 8,700 and 8,000 BP. This moraine may be contemporaneous with the Cockburn moraines. The ice-cored moraines of the present glaciers in the mountain valleys have been static for several years. (Gabriel-USGS)

2D. Evaporation and Transpiration

COMPARISON OF VARIOUS METHODS OF DETERMINING EVAPORATION IN AN IRRIGATED FIELD IN THE VAKHSH VALLEY OF TADZHIKISTAN,
L. P. Lapshova.
Transl from Trudy GGO, No 230, p 109-116, 1968. Soviet Hydrology: Selected Papers, No 4, p 354-359, 1968. 2 fig, 2 tab, 16 ref.

Descriptors: *Thermal radiation, *Evaporation, Irrigated land, Lysimeters, Cotton, Evapotranspiration, Soils, Soil moisture.
Identifiers: *USSR, Tadzhikistan, Vakhsh Valley.

Thermal-balance was found to be the best method for determining the total evaporation from the cotton-growing areas. Lysimetry is another method used in irrigated regions. Total evaporation in the Vakhsh Valley, Tadzhikistan can be computed from the radiation balance of an irrigated field. However, this method yields reliable results only during the budding-flowering and ripening phases of the cotton. Evaporimeter data can be used to calculate evaporation when information on the radiation balance is not available. (Carstea-USGS)

EVAPORATION WATER LOSSES UNDER SPRINKLING IRRIGATION CONDITIONS (RUSSIAN),
All-Union Research Inst. for Water Engineering and Reclamation, Moscow (USSR).
V. A. Anisimov, and M. S. Mansurav.
Gidrotekhnika i Melioratsiya, No 8, p 37-43, Aug 1969. 5 fig, 1 tab, 10 ref.

Descriptors: *Evaporation, *Water loss, *Sprinkler irrigation, *Air temperature, Irrigation systems, Crop production, Pipelines, Raindrops, Humidity, Wind velocity, Meteorology.
Identifiers: *USSR, Sprinkling irrigation water loss.

The effects of wind, air temperature, type of crop, and sprinkler-nozzle dimension on water loss by evaporation, using sprinkler irrigation, were analytically and experimentally investigated during 1965-1967. In arid areas, the use of minimal sprinkling intensity is justified only until a limit is reached. Discrete sprinkling of low intensity covering a small area may lead to a considerable water loss by evaporation from the plant leaves. (Gabriel-USGS)

COMPARATIVE PLANT WATER RELATIONS,
Aberdeen Univ. (Scotland). Dept. of Botany.
P. G. Jarvis.
Annals of Arid Zone, Vol 6, No 1, p 74-91, 1967. 101 ref.

Descriptors: *Soil-water-plant relationships, *Leaves, *Moisture stress, *Atmosphere, *Transpiration, Plant growth, Metabolism, Field capacity, Stomata, Drought resistance, Root distribution, Solar radiation, Heat balance, Osmotic pressure, Turgidity, Plant physiology, Surfaces, Moisture content, Soil moisture.
Identifiers: *Water potential.

A review is made of the extensive modern literature on plant-water relations and plant physiology to develop a broad discussion of current knowledge of water relations within plants and ways that different features of species may affect their response to a limited water supply. Transpiration is an energy-dependent process; when water is freely available the transpiration rate depends largely on atmospheric conditions. With moisture stress the system ceases to be the direct result of atmospheric conditions but is modified by the plant. Effects of moisture stress on plant metabolism and growth are influenced by 2 groups of plant factors: (1) Those factors affecting water potential in leaves: rooting habit of the plant, resistance to water passage from roots to leaves, and influence of plant surfaces on transpiration, (2) Influence of leaf water potential on physiology of growth: relationship between leaf water potential and turgidity, relationship between turgidity and stomatal aperture and direct effects of low turgidity and water potential on metabolism. Each of these aspects is presented individually with quantitative expressions developed where possible and relevant. Possible differences in influence of the various factors in different types of plants are also discussed. There are many plant factors of varying importance which determine the response of a particular plant population to water stress. None of these has been studied in sufficient detail to make objective assessments of its relative importance among the species. (Crouse-Arizona)

WATER AND RELATED LAND RESOURCES, CENTRAL LAHONTAN BASIN - WALKER RIVER SUBBASIN NEVADA-CALIFORNIA.
Nevada River Basin Survey, Carson City.

Department of Agriculture Cooperative Survey Report, June 1969. 232 p, 23 fig, 75 photo, 9 map, 39 tab, 103 ref, 2 append.

Descriptors: *Water resources, *Groundwater, *Surface waters, *Nevada, *California, Water yield, Water utilization, Streamflow, Aquifers, Irrigation water, Domestic water, Economics, Water resources development, Water management (Applied), Water rights, Water law.
Identifiers: *Walker River (Nev-Calif).

A report of the water resources of Walker River Subbasin, Calif-Nev, includes an inventory of the natural resources and problems; an analysis of economic development; a short discussion of existing resource projects and programs; and an indication of the opportunities for development. The Walker River Subbasin is one of three subbasins within the Central Lahontan Basin. Of the 2,733,660 acres in the subbasin, 595,700 acres are in California and 2,137,960 acres in Nevada. The Walker River drainage heads in the Sierra Nevada in California, and flows into Nevada, where it terminates in Walker Lake. Presently, about 119,870 acres are irrigated, with alfalfa and pasture the chief crops grown. The 50% chance water yield (5 out of 10 yr) was approximately 396,800 acre-feet; the 80% chance water yield is about 293,600 acre-feet. An estimated 232,600 acre-ft are used by the crops from surface flows. Approximately 34,600 acre-ft were pumped from groundwater in the two major irrigated valleys (Smith and Mason Valleys), in 1964. Total amount of water available from underground sources is estimated to be 6,500,000 acre-ft; however, total recharge to the groundwater supply is only about 206,000 acre-ft; during a 50% chance water year. Much of the subbasin is subject to both wet- and dry-mantle floods. (Knapp-USGS)
W70-02868

FORECASTING THE RHINE RIVER DISCHARGES (FRENCH),
Electricite de France, Grenoble. General Technical Div.
F. Lugiez, P. Kasser, H. Jensen, and P. Guillot.
English summary. Bulletin of the International Association of Scientific Hydrology, Vol 14, No 3, p 91-116, Sept 1969. 26 p, 14 fig, 6 tab, 24 ref.

Descriptors: *Stream flow forecasting, *River flow, *Flood forecasting, Hydrologic data, Lakes, Rainfall, Snow, Runoff, Seasonal, River basins, Watersheds (Basins), Mapping, Gaging stations, Statistical methods, Hydrograph analysis, Correlation analysis, Frequency.
Identifiers: *Rhine river, Discharge forecasting.

Forecasts of the discharge of the Rhine River have been studied in Zurich since 1954 in cooperation with the power and water management organizations of Switzerland, Germany, France, and the Netherlands. Annual forecasts are made of the water yield from snowmelt data. For short-term forecasts, the significant predictors are discharge and rainfall, and for long-term forecasts, the alpine snow pack and the levels of the Swiss lakes play an important role. These forecasts are used by the hydropower plants in their operation programs, maintenance, and proper timing of construction work. (Gabriel-USGS)

HURRICANE CAMILLE TIDAL FLOODS OF AUGUST 1969 ALONG THE GULF COAST, PASCAGOULA QUADRANGLE, MISSISSIPPI,
Geological Survey, Washington, D.C.
K. V. Wilson, and James W. Hudson.
For sale by the US Geological Survey, Map Division, Wash, DC, 20240, for $0.75 per copy. Geol Surv Hydrol Invest Atlas HA-406, 1 sheet, 1969. Text, 2 fig, 1 map, 1 tab, 3 ref.

Descriptors: *Floods, *Mississippi, *Hurricanes, *Flood damage, *Coasts, Tidal effects, Atmospheric pressure, Rain, Surges, Wind velocity, Winds, Disasters, Storms, Waves (Water), Water levels, Water level fluctuations, Inlets (Waterways), Sea level, Shores.
Identifiers: *Hurricane Camille (1969), Pascagoula (Miss), Tidal floods, Storm tides.

The areas flooded by Hurricane Camille tides of August 18, 1969 along the Mississippi Gulf Coast are shown in a series of hydrologic atlases. The Atlas of the Pascagoula quadrangle shows flooded areas on a topographic map scaled 1:62,500. Camille was the most intense hurricane on record to enter the U.S. mainland. Estimated maximum winds were 190 mph, and the central pressure was 26.61 inches of mercury. The eye of the storm, traveling about due north, passed over the Waveland-Bay St. Louis area and winds of over 75 mph extended about 50 mi on each side. Maximum precipitation was 10 inches. Flooding was most severe in the Pass Christian area where tides reached 25 ft above msl. High tide frequency and annual maximum tide are shown by graphs. (Knapp-USGS)

CAUSES OF FLOODING OF LITTLE CHARLEY BOWLEGS CREEK UPSTREAM FROM HIGHLANDS HAMMOCK STATE PARK, FLORIDA,
Geological Survey, Tallahassee, Fla.
W. R. Murphy, Jr.
Geological Survey Open-file Report, 1968. 16 p, 11 fig

Descriptors: *Flooding, *Florida, *Stage-discharge relations, Dams, Profiles, Flood damage, Rainfall-runoff relationships, Regulation, Streamflow, Backwater, Flow profiles, Reservoirs, Water levels.
Identifiers: Highland Hammocks State Park (Fla).

Complaints of flooding on Little Charley Bowlegs Creek, Florida, led to an investigation of the effects of a dam in Highlands Hammock State Park on backwater conditions upstream in low-lying pastures. The concrete dam creates a nearly level conservation pool within the park during low water. Little or no backwater from the dam (without flashboards) extends beyond the park boundary during flood stages. The lowlands upstream from the park form a broad, flat marsh that would experience flooding following heavy rains even if there were no dam. No channel constrictions occur within the park which would cause backwater in the park or upstream from the park. The channel upstream from the south park boundary is inadequate to convey flood flows to the park because of: (1) lack of adequate slope, (2) small cross-sectional area, and (3) its clogged condition due to vegetation. Flooding of lowlands upstream from the park is attributable chiefly to these factors. (Knapp-USGS)
W70-03071

ON THE VALIDITY OF UNIT HYDROGRAPH THEORY,
Illinois Univ., Urbana. Dept. of Civil Engineering.
Ben Chie Yen, Basil Anderson, and Ven Te Chow.
Paper presented at 50th Annual Meeting of American Geophysical Union, Wash, DC, Apr 21-25, 1969. 20 p. NSF Grant GK-1155.

Descriptors: *Hydrograph analysis, *Theoretical analysis, *Dimensional analysis, *Rainfall-runoff relationships, Runoff, Froude number, Reynolds number, Laminar flow, Turbulent flow, Unit hydrographs.
Identifiers: Kinematic wave theory.

Through dimensional analysis and the examination of the characteristics of the equation of motion describing watershed runoffs it is demonstrated that the linearity assumption of the unit hydrograph theory is only an approximation. The Reynolds number, R, and Froude number, F, of the flow and a parameter expressing surface detention storage are the important factors affecting the shape of the unit hydrograph. Quantitative evidence of the approximation of the linearity assumption is given by approximate theoretical solutions based on (1) Stokes range flow and (2) kinematic wave theory applied to both laminar and turbulent flow. Laboratory and field experimental data are also analyzed and the nonlinear characteristics of the unit hydrograph are clearly shown. (Carstea-USGS)
W70-03076

THE NORTH BOSQUE WATERSHED INVENTORY OF A DRAINAGE BASIN,
Baylor Univ., Waco, Tex. Dept. of Geology.
Cleo V. Proctor, Jr.
Report available for sale from Department of Geology, Baylor University, Waco, Texas, 76703, Price $1.04 postpaid. Baylor Geological Studies Bulletin No 16, Spring 1969. 40 p, 26 fig, 3 tab, 51 ref, append.

Descriptors: *River basins, *Texas, *Hydrologic data, *Data collections, Surveys, Watersheds (Basins), Streamflow, Sediment yield, Erosion, Geomorphology, Floods, Topography, Rainfall-runoff relationships, Geology, Hydrogeology, Water quality.
Identifiers: *North Bosque Watershed (Tex).

The geomorphology of the four physiographic regions within the North Bosque watershed, Texas, is directly related to the properties of the rocks outcropping within those regions, and a dynamic equilibrium exists between erosional energy and topography. Landforms are being downwasted at the same rate, and differences in relief and form can be explained in terms of spatial relationships rather than evolutionary development through time. Because of the location of the North Bosque watershed, flood discharges reaching the magnitude of 500,000 cfs can be expected during a long period of record. Sheet erosion is the major sediment producer in the North Bosque watershed. Sheet erosion lowers the land surface by a maximum of approximately 0.095 cm/yr. Solution is also important and lowers the land surface by approximately 0.0012 cm/yr. In the North Bosque watershed several empirical relationships are given to relate geomorphology, hydrology, and erosional energy. (Knapp-USGS)

FLOODS IN NEW YORK-1968,
Geological Survey, Albany, N.Y.
F. Luman Robison.
New York Water Resources Commission Report of Investigation RI-9, 1969. 30 p, 6 fig, 1 tab.

Descriptors: *Floods, *New York, *Flood damage, Discharge (Water), Stage-discharge relations, Data collections, Hydrologic data, Streamflow, Flood plains, Floodwater, Rainfall, Precipitation (Atmospheric).
Identifiers: Flood data.

Information is presented on floods reported in New York State during the calendar year 1968. The information was obtained from newspaper clippings, from the U.S. Weather Bureau publications 'Storm Data and Unusual Weather Phenomena, 1968' and 'Daily Precipitation Records,' from records of the U.S. Geological Survey, and from reports of the U.S. Army Corps of Engineers. Floods were reported someplace in New York in every month of 1968, but at most sites the resulting damage was not great. The most serious flood event of the year occurred in the southeastern part of the State at the

end of May. Heavy rain began about 10 pm on May 28 and ended before noon the next day. The maximum measurement of 5.54 inches was recorded at Dobbs Ferry, Westchester County. At Central Park in New York City a reading of 4.88 inches broke a 60-yr record for 24-hr rainfall. Peak discharges for many streams in the flood area are tabulated with corresponding maximum peaks of record prior to May 29 for comparison. (Knapp-USGS)
W70-03103

FLOODS OF AUGUST 1967 IN MARYLAND AND DELAWARE,
Geological Survey, Towson, Md.
D. H. Carpenter, and R. H. Simmons.
Geological Survey Open-file Report, 1969. 98 p, 36 fig, 1 tab.

Descriptors: *Floods, *Maryland, *Delaware, *Rainfall, *Historic flood, Data collections, Gaging stations, Hydrologic data, Discharge (Water), Flood damage, Erosion, Rainfall-runoff relationships, Stage discharge relations, Precipitation intensity.
Identifiers: Flood records, Crest-gage stations.

Intense rainfall associated with severe thunderstorm activity during several periods in August 1967 caused considerable flooding throughout much of Maryland and Delaware. Precipitation intensities up to 2-1/2 inches in 1 hour and totals up to 9 inches in 6 hours were experienced. Total recorded rainfall for the month ranged from less than 5 inches in western Maryland to 19 inches on the Eastern Shore, in the wettest month since August 1955. Extensive damage was done. Numerous dams, bridges, culverts, and portions of roadways were washed out. Total damage was estimated to be more than $1,700,000. Discharge data are presented for 61 regular gaging stations, 30 crest-gage stations, and 3 miscellaneous sites. Maximum peaks of record occurred at 20 of the regular gaging stations. The maximum peak discharge rate recorded was 1,190 cfs per sq mi. (Knapp-USGS)
W70-03104

ATTEMPT AT AN ESTIMATE OF BANK REGULATION OF STREAMFLOW IN THE BASIN OF THE SEVERSKIY DONETS RIVER,
V. P. Yunitsyna.
Transl from GGI, Sbornik Rabot po Gidrologii, No 8, p 122-130, 1968. Soviet Hydrology: Selected Papers, No 4, p 393-400, 1968. 3 fig, 2 tab, 10 ref.

Descriptors: *Bank storage, *River flow, Rivers, Channels, Water level fluctuations, Groundwater recharge, Surface waters, Soil moisture, Statistical methods, Equations, Surface-groundwater relationships.
Identifiers: *USSR, *Severskiy Donets River.

The quantitative aspects of the bank regulation process are important in understanding relationships between surface and groundwater. Computations were made for reaches of the main Donets River and for the other tributaries of the drainage system, using aerial photographs, hydrographic, hydrometric, and hydrogeologic data. The data obtained were: (1) daily water volumes in the channel and banks; (2) variation in bank volumes in time and along the river; (3) daily volumes of inflow to the channel network. For example, during the 1963 flood when the river level rose 4 m, the amount of water accumulated in the banks was 46 million cu m. By contrast, only 4.75 million cu m seeped into the ground when the river level rose only 2.3 m. (Carstea-USGS)

CONVERSION OF ANNUAL STREAMFLOW TO A LONG PERIOD,
A. V. Rozhdestvenskiy.
Transl from GGI, Sbornik Rabot po Gidrologii, No 8, p 3-13, 1968. Soviet Hydrology: Selected Papers, No 4, p 365-374, 1968. 3 fig, 3 tab, 4 ref.

Descriptors: *Data collections, *Steamflow, *Simulation analysis, Equations, Flow, Statistical methods, Monte Carlo method, Rivers, Time series analysis, Hydrologic properties.
Identifiers: *USSR, Neva River, Tikhvinka River.

Annual streamflow is converted to a long period by simulating a short-period hydrologic series for a period for which there are observations at an analogous point. The proposed method can be used to convert series of not less than 15-20 years to a longer period. The method consists of the following steps: (1) Computation of the dynamic normal flow from a given short observation series and from an analogous series; (2) construction of graphs of the relationship between the dynamic flow normals over a common observation period for points with short and long records; and (3) random, uncorrelated fluctuations with respect to the dynamic flow normal are correlated by the Monte Carlo method. These steps are discussed and illustrated with data from the Neva River at Petrokrepost and the Tikhuinka River at Gorelukhi. (Carstea-USGS)

WATERS OF 'MIDDLE ASIA' (RUSSIAN),
Akademiya Nauk SSSR, Moscow. Institut Geografii.
N. T. Kuznetsov.
Moscow, Izdatel'stvo 'Nauka', 1968. 272 p, 56 fig, 23 tab, 288 ref.

Descriptors: *Water resources, *Surface waters, Water balance, Water demand, Water chemistry, Water supply, Climatic data, Frost, Groundwater, Glaciers, Lakes, River systems, Bibliographies.
Identifiers: Outer and Inner Mongolia, North China, Middle Asia (USSR).

The hydrology of the Mongolian Peoples' Republic, Inner Mongolia, and several dry provinces in China, in total area over 4,200,000 sq km, is described. The hydrological and chemical characteristics of the rivers, lakes, and water reservoirs were identified and expressed in numerous tables and charts. The water sources of 'Middle Asia' are the snow-melt waters and summer precipitation. In general the formation runoff on 'Middle Asia' takes place higher absolute altitudes than that of Central Asia. The rivers of 'Middle Asia' have later snow floods than those of Central Asia. Topics discussed include: (1) the effect of geographical conditions on the life present in rivers, lakes, and marsh lands; (2) development of rivers and lakes in the Quaternary period; (3) rivers; (4) lakes and marsh lands; and (5) the paths and possibilities of the development of water economy. FLOOD-PLAIN DRAINAGE AND FLOOD DISCHARGES OF THE UKRAINIAN SMALL RIVERS (RUSSIAN),
Ukrainian Scientific Research Inst. of Hydroengineering and Land Reclamation (USSR).
G. P. Kubyshkin.
Gidrotekhnika i Melioratsiya, No 8, p 55-59, Aug 1969. 2 fig, 2 tab, 6 ref.

Descriptors: *Drainage, *Flood plains, *Floods, *Rivers, *Floodwater, *Discharge (Water), Climates, Reclamation, Peat, Bogs, Snowmelt, Runoff, Soils, Agricultural engineering, Statistical models, Cost analysis.
Identifiers: *USSR, Flood plain drainage, Ukrainian rivers.

The effect of flood-plain drainage was experimentally investigated by comparing the maximum and minimum discharges of small Ukrainian rivers before and after the introduction of a reclamation drainage system. Analysis of the data collected during the 40-year period shows that the reclamation drainage of flood plains leads to a considerable decrease of runoff magnitudes of both low and high frequencies. This decrease in flood intensity permits the construction of river dams of smaller discharge capacity. (Gabriel-USGS)

LINEAR ROUTING IN UNIFORM OPEN CHANNELS,
University Coll., Cork (Ireland). Dept. of Civil Engineering.
J. C. I. Dooge, and B. M. Harley.
Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 8, p 57-63, 1967. 7 p, 4 fig, 7 ref.

Descriptors: *Rainfall-runoff relationships, *Routing, *Streamflow forecasting, *Open channel flow, *Mathematical models, Linear programming, Computers, Digital computers, Flood forecasting, Simulation analysis, Flood routing.
Identifiers: Linear routing (Open channel flow).

A general linear solution to the flood routing problem is obtained by solving a linearized equation of motion for a semi-infinite uniform open channel subject to a delta-function inflow at the upstream end. This general linear solution is used to compare the accuracy of the more important special linear procedures used in applied hydrology for flood routing. The effect of varying the reference discharge which is used as the basis of the linearization is also examined. (Knapp-USGS)

USE OF LOG-TRANSFORMATION TO THE ANALYTICAL REPRESENTATION OF RIVER RUNOFF,
Hokkaido Univ., Sapporo (Japan). Dept. of Civil Engineering.
Tsutomu Kishi.
Proceedings International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 4, p 25-30, 1967. 6 p, 2 fig.

Descriptors: *Rainfall-runoff relationships, *Streamflow forecasting, *Statistical methods, *Unit hydrographs, *Hydrograph analysis, Routing, Runoff forecasting, Flood forecasting.
Identifiers: Runoff analysis, Tokoro River (Japan).

The nonlinear character of river runoff has been pointed out by many investigators. Unit graphs derived from different storms for a river basin are not identical, in general, except for some favorable cases in which various integrating influences of the basin smooth out the nonlinearity. A theory is developed to give mathematical expressions to variable distribution graphs or unit graphs. Asymmetric distribution graphs can be transformed to the normal distribution curve by using a log-transformation. The inherent variation of the runoff character is described by assigning a particular set of values for the parameters of a transformation

relationship. Several types of transformation relationships are investigated. Application of the theory to the analysis of runoff for the Tokoro River, Hokkaido, Japan is given as an illustrative example. (Knapp-USGS)

QUEBRADA DE LOS CEDROS, SOUTHWESTERN PUERTO RICO, AND ITS BEARING ON SOME ASPECTS OF KARST DEVELOPMENT,
Puerto Rico Univ., Mayaguez. Dept. of Geology.
Mounir T. Moussa.
Journal of Geology, Vol 77, No 6, p 714-720, Nov 1969. 7 p, 2 fig, 4 ref.

Descriptors: *Karst, *Structural geology, *Drainage patterns (Geologic), *Puerto Rico, Limestones, Caves, Geomorphology, Erosion, Permeability, Porous media, Fractures (Geology), Joints (Geology).
Identifiers: *Karst development, *Subterranean stream piracy.

The gorge of Quebrada de los Cedros (a tributary of Rio Macana in southwestern Puerto Rico) is a deroofed portion of a complex cavern system through which part of the drainage of Rio Tallaboa was diverted by a process of subterranean stream piracy. The karst features in Quebrada de los Cedros and in other parts of the region indicate that the absence of extensive karst development in the mid-Tertiary limestones in southwestern Puerto Rico is probably due to their lack of mass permeability rather than to insufficient rainfall. The direction of the underground flow in the upper part of the quebrada is against the direction of the dip of the beds, which indicates that the structural control is not critically important in the development of subterranean passageways. Water will move along any plane, whether structurally controlled or not, as long as it has the opportunity to be drained at a lower level under the force of gravity. (Knapp-USGS)

LAND SUBSIDENCE DUE TO WITHDRAWAL OF FLUIDS,
Geological Survey, Sacramento, Calif.; and Geological Survey, Washington, D.C.
J. F. Poland, and G. H. Davis.
Geological Society of America, Inc Reviews in Engineering Geology II, p 187-269, 1969. 83 p, 49 fig, 7 plate, 2 tab, 119 ref, index.

Descriptors: *Subsidence, *Withdrawal, *Groundwater, Settlement (Structural), Water wells, Oil wells, Compaction, Pore pressure, Elasticity (Mechanical), Artificial recharge, Clays.
Identifiers: Subsidence-fluid withdrawal relationships.

Land-surface subsidence due to the withdrawal of fluids by man has become relatively common in the United States since 1940 and has been described at several other places throughout the world. Known examples of appreciable land subsidence are reviewed. Those related to exploitation of oil and gas fields include Goose Creek, Texas; Wilmington, California; Lake Maracaibo, Venezuela; Niigata, Japan; and the Po Delta in Italy. The areas related to groundwater withdrawal include areas in Japan; Mexico City, Mexico; and Texas, Arizona, Nevada, and California. The areas of greatest extent and maximum subsidence are in California. The principles involved in the compaction of sediments and of aquifer systems are examined briefly. The amount of compaction that a confined aquifer system will experience is a function of compressibility. Other factors that influence compaction (and, in part, compressibility) include particle size and shape, clay mineralogy, geochemistry of pore water in the clayey beds and of the water in contiguous aquifers, and secondary compression. Subsidence problems are alleviated by cessation of withdrawal and increase or restoration of reservoir pressure. The greatest control measures are taken at Wilmington, California, where subsidence of 27 feet is nearly stopped; in addition, significant rebound has occurred. (Knapp-USGS)

GROUNDWATER INVESTIGATION, MOUNT KOBAU, BRITISH COLUMBIA,
Department of Energy, Mines and Resources, Ottawa (Ontario). Inland Waters Branch.
E. C. Halstead.
Inland Waters Branch Technical Bulletin No 11, Department of Energy, Mines and Resources, 1969. 14 p, 14 fig, 3 tab, 2 ref.

Descriptors: *Water supply, *Groundwater, *Hydrogeology, *Hydrologic budget, Water wells, Recharge, Groundwater movement, Discharge (Water), Aquifers, Streamflow, Snowmelt, Water levels, Water storage, Reservoirs.
Identifiers: *Canada, Mt. Kobau (British Columbia), Aquifer testing.

The groundwater budget of Mt. Kobau, British Columbia was studied by drilling 5 test wells and testing a production well drilled for the water supply of a proposed Canadian National Observatory site. The flow of Testalinden Creek is maintained by the storage, movement and discharge of groundwater in fractured bedrock which outcrops at the summit of Mount Kobau. The groundwater is recharged annually by snowmelt. The pump test was continuous for 47 hours at a rate of 7.5 imperial gpm with a drawdown of 52.2 feet. During the 1967 calendar year, total precipitation was 20.91 inches, of which 3.61 inches fell as rain and the remaining 17.30 inches, as snow. The groundwater recharge into the fractured bedrock depends upon the volume of snowmelt. The thin overburden, which functions as a permeable mantle beneath the snow cover, retains a significant volume of meltwater long enough to enable recharge to continue well beyond the peak of the melting season. Groundwater recharge at the summit is sufficient to sustain a minimum base flow in Testalinden Creek of 0.2 imperial gpm. (Knapp-USGS)

A METHOD OF ANALYZING TRANSIENT FLUID IN MULTILAYERED AQUIFERS,
Pahlavi Univ., Shiraz (Iran); California Univ., Berkeley.
Iraj Javandel, and Paul A. Witherspoon.
Water Resour Res, Vol 5, No 4, p 856-869, Aug 1969. 14 p, 10 fig, 13 ref.

Descriptors: Transients, *Unsteady flow, *Aquifers, Methodology, Theis equation, Fluid flow, *Groundwater flow, Anisotrophy, Permeability, Drawdown, Numerical analysis, Groundwater, Pumping, Analysis.
Identifiers: *Transient flow, Finite element method, Two-part aquifers, Boundary conditions.

A new approach to transient fluid flow in multilayered aquifers of anisoptropic systems was developed using the finite element method. This is a numeric technique in which an initial boundary value problem is converted to a variational problem and applied to a discrete system of elements. The method was used to investigate potential distributions in multilayered aquifers of finite radial extent being pumped at constant rate using completely penetrating wells. An analysis of 2-layer systems with permeability contrasts of up to 100:1 indicates that at early time the drawdown behavior can vary significantly from the Theis solution, depending on where observations are made. As time increases, results converge on the Theis solution, regardless of the permeability contrast. A 13-layer aquifer containing either isotropic or anisotropic layers was also examined. Results are in general agreement with the behavior for 2-layer systems. (USBR)

THE CONVOLUTION RELATION AS APPLIED TO ESTIMATING RECHARGE FROM AN EPHEMERAL STREAM,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
Allen F. Moench, and Chester C. Kisiel.
Available from the Clearinghouse as PB-189 083, $3.00 in paper copy, $0.65 in microfiche. Paper presented at 50th Annual Meeting of American Geophysical Union, Wash, DC, Apr 21-25, 1969. 20 p. OWRR Grants No B-007-ARIZ, and A-010 WRRC-ARIZ.

Descriptors: *Surface-groundwater relationships, *Model studies, *Mathematical models, Induced infiltration, Observation wells, Equations, Groundwater movement, Groundwater recharge, Aquifer characteristics, Channel morphology, Recharge, Water yield, Water levels, Ephemeral streams, Hydrogeology.
Identifiers: Hydrologic model studies.

A linear model is presented which enables one to estimate recharge from a source of finite width and infinite length given water level measurements in an observation well. The method requires solution

of the inverse problem of finding the system input given the system output (water level measurements) and the system impulse response function. The impulse response function is derived from the linear equations of groundwater motion for the particular geometry of this study. The discrete form of the convolution integral is rearranged so as to obtain the system input (timewise variation of recharge) by the method of synthetic division. Aquifer constants are estimated independently. Total recharge is obtained by integrating the system input over the appropriate time period. For the particular event and location of this study, results are in good agreement with an independent estimate of recharge. (Carstea-USGS)

ELECTRICAL RESISTIVITY SURVEY IN THE PIEDMONT AREA, ALABAMA,
Alabama Geological Survey, University; and Auburn Univ., Ala. Water Resources Research Inst.
W. Leon Scarbrough, Thomas J. Joiner, and James C. Warman.
Geological Survey of Alabama Circular 57, 1969. 20 p, 11 fig, 3 plate, 34 ref. OWRR Proj No A-009-ALA.

Descriptors: *Electrical studies, *Resistivity, *Subsurface mapping, *Groundwater, *Alabama, Weathering, Geology, Surveys, Aquifers, Geophysics, Structural geology, Faults (Geology), Fissures (Geology), Hydrogeology.
Identifiers: Groundwater prospecting.

Electrical resistivity investigations were made in the Piedmont of Alabama by assuming that weathered or solutionally enlarged water-bearing openings along fractures in the bedrock would be more conductive than solid unaltered bedrock and would be indicated as conductive anomalies. A semi-empirical method using the bedrock surface as a datum plane was used. Approximately 12 square miles in and around the town of Heflin and 2 square miles about 10 miles southeast of Heflin were included in this study. When electrical resistivity methods are correlated with other geophysical data and with geologic, hydrologic and topographic data they are valuable tools for solving groundwater problems. Resistivity anomalies were interpreted to indicate sand and gravel deposits in alluvium, and deeply weathered fracture zones in saprolite and bedrock, caused by localized occurrence and movement of groundwater. Lateral changes in the lithology of alluvium and saprolite have also been interpreted. (Knapp-USGS)

THEORETICAL ANALYSIS OF REGIONAL GROUNDWATER FLOW,
California Univ., Berkeley.
R. A. Freeze.
Inland Waters Branch Scientific Series No 3, Department of Energy, Mines and Resources, Ottawa, Canada, 1969. 200 p, 31 fig, 63 ref, 2 append.

Descriptors: *Mathematical models, *Computer programs, *Groundwater movement, Mathematical studies, Computer models, Flow nets, Water levels, Water level fluctuations, Water yield, Safe yield, Recharge, Discharge (Water), Mapping, Water table, Model studies, Groundwater basins.
Identifiers: *Canada, Groundwater basin analysis.

A mathematical model representing steady-state regional groundwater flow in a three-dimensional, nonhomogeneous, anisotropic groundwater basin is developed. Two independent methods of solution are presented: the analytical separation of variables technique is used to solve the two-dimensional, 3-layer case; the numerical finite-difference approach is used to solve the general case. The numerical method is more versatile, mathematically simpler, and well-suited to computer-oriented methods of data storage. Computer programs are presented for both methods; the output consists of plotted potential nets from which flow patterns can be constructed. The potential patterns for over 70 hypothetical cases are presented to illustrate the qualitative and quantitative control exerted on the flow system by: (a) the 'depth/lateral extent' ratio of the groundwater basin; (b) the configuration of the water table; and (c) the geologic configuration and resultant permeability contrasts. The concept of 'natural basin yield' is introduced. The mathematical model approach using numerical solutions and the digital computer can be used both as a reconnaissance tool preceding field investigation and as an interpretive tool following the field program. The results of mathematical model analyses on two actual groundwater basins in the Canadian prairies are presented. (Knapp-USGS)

GROUNDWATER DEVELOPMENT IN IDAHO - 1968,
Idaho Dept. of Reclamation, Boise.
Dale R. Ralston.
Idaho Department of Reclamation Water Information Bulletin No 10, May 1969. 24 p, 14 fig, 3 tab.

Descriptors: *Water resources development, *Idaho, *Groundwater, Water wells, Aquifers, Water supply, Water rights.
Identifiers: Groundwater development (Idaho).

Groundwater development in Idaho increased in activity in 1968 with 55% more applications approved to appropriate groundwater and 70% more wells reported drilled than in 1967. A large portion of the increase in filings was the result of small irrigation or domestic filings. The Boise River area was the center of groundwater development in the state, in both applications approved and wells reported drilled. The south Snake Plain areas, Aberdeen-Springfield, Minidoka-Jerome, and Wood River, are also important areas with respect to the ultimate groundwater development of the state. These areas included about one-third of the total quantity appropriated in 1968 and are located on the very productive Snake Plain aquifer. Agricultural growth will be influenced by decisions concerning desert land entries and by the general availability of surface water. (Knapp-USGS)

HYDROGEOLOGY AND GROUNDWATER RESOURCES OF THE GRAVELBOURG AQUIFER, SASKATCHEWAN,
California Univ., Berkeley.
R. Allan Freeze.
Inland Waters Branch Scientific Series No 6, Department of Energy, Mines and Resources, Ottawa, Canada, 1969. 60 p, 31 fig, 14 tab, 38 ref, 2 append.

Descriptors: *Hydrogeology, *Aquifers, *Glacial drift, *Gravels, *Sands, Permeability, Transmissivity, Recharge, Discharge (Water), Groundwater movement, Storage coefficient, Water quality, Water chemistry, Water utilization.
Identifiers: *Canada, *Gravelbourg (Saskatchewan).

The groundwater flow pattern in the Gravelbourg aquifer, Saskatchewan was delineated by a number of hydrogeological mapping techniques. Quantitative characteristics of the aquifer were determined from one pumping test. The aquifer consists of stratified Pleistocene glacial sand together with associated thin outwash, overlain by less-permeable Pleistocene sediments, and is underlain by poorly permeable shale. The bedrock surface in the Gravelbourg area is a broad valley opening to the northeast, which controls the extent of the stratified drift. Flow through the aquifer is essentially horizontal, with some discharge occurring through the overlying sediments. The major discharge is into Old Wives Lake. Recharge occurs through the glacial till and the silty clay phase of the stratified drift from the adjacent morainal upland areas and from the upstream part of the overlying plain. The water from the aquifer is a sodium sulfate type, with 2500 to 5500 ppm dissolved solids, barely potable without treatment, and unsuitable for irrigation. The maximum transmissibility of the aquifer is 5200 Imperial gpd per ft and the coefficient of storage is 0.00092. The horizontal permeability is 104 Imperial gal/day/sq ft. The vertical permeability of the glacial till is in the order of 3-20 gal/day/sq ft, as determined by tritium dating and pump testing evidence. The safe yield of the aquifer is 280 acre-ft per yr; present utilization is 56 acre-ft per yr. (Knapp-USGS)

Toulouse Univ. (France). Institut de Mecanique des Fluides.
Claude Thirriot, and Jean Pierre Villeneuve.
Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 28, p 211-217, 1967. 7 p, 5 fig.

Descriptors: *Unsteady flow, *Porous media, *Model studies, *Hydraulic models, *Surface-groundwater relationships, Groundwater movement, Induced infiltration, Infiltration, Discharge (Water), Water levels, Water level fluctuations.
Identifiers: Boussinesq equation.

Unsteady periodical flow is studied in porous media lying between two tanks representing lakes, rivers, or channels. One tank level varies sinusoidally. This problem is examined both theoretically, using two linearizing processes of Boussinesq's equation, and by experimental devices including a glass-marble model. Curve boards showing fluctuation amplitude and phase in each medium point show the influence of frequency and ratio of entrance amplitude to mean water height on the upstream boundary. (Lang-USGS)

Report available from Clearinghouse as AD-688 177, for $3.00 in paper copy, $0.65 in microfiche. US Army Electronics Command Technical Report Ecom-0034-F, Atmospheric Sciences Lab, July 1968. 77 p, 38 fig, 9 tab, 81 ref. Grant DAAB07-67-C-0034 Proj No IVO-14501-B53A-08.

Descriptors: *Soil water movement, *Soil physical properties, *Diffusivity, *Evapotranspiration, Soil moisture, Soil water, Percolation, Diffusion, Thermodynamics, Heat transfer, Mass transfer, Water balance, Evaporation, Infiltration, Unsaturated flow.
Identifiers: Soil water diffusivity.

A laboratory method was developed for calculating isothermal soil water diffusivity values for soils at 5 to 15 volume percent water. The redistribution of soil water within columns of Columbia fine sandy loam in response to imposed temperature gradients was analyzed. Transient water content distribution and soil temperature were recorded. Values of net water flux were examined in light of Fick's law, a diffusion theory proposed by Philip and de Vries, and an irreversible thermodynamic theory used by Taylor and Cary. Fick's law consistently underpredicted the observed water fluxes while the Philip-de Vries theory yielded acceptable values. Predictions of water flux based upon the Taylor-Cary theory were not acceptable. An intensive field investigation was conducted to measure and predict the soil temperature behavior during and following infiltration. A simplified mathematical model was used to predict temperature changes from the soil surface to a depth of 2 meters. The quantities of heat added by the infiltrating water were compared with the terms in the energy balance equation for that soil surface. Water balance measured at the soil surface allowed an estimate of the water moving past the root zone of an actively transpiring crop. (Knapp-USGS)

RECENT ADVANCEMENTS IN THE USE OF STANDARD CLIMATIC DATA FOR ESTIMATING SOIL MOISTURE,
Department of Agriculture, Ottawa (Ontario). Plant Research Inst.
W. Baier.
Annals of Arid Zone, Vol 6, No 1, p 1-21, Mar 1967. 22 p, 5 tab, 3 fig, 47 ref.

Descriptors: *Arid lands, *Soil moisture, *Soil-water-plant relationships, *Climatic data, *Water balance, Soils, Wheat, Droughts, Micrometeorology, Evapotranspiration, Computer models, Statistical methods, Moisture availability, Crop response, Evaporation, Electrical resistance.
Identifiers: *Canada, Electrical resistance blocks, Potential evaporation, Parameters.

There have been many studies of plant response to microclimatic parameters, but many of the parameters are not generally available and are difficult to measure. This paper reviews advances in technique to estimate soil moisture and crop response from standard climatic data which is widely available. This technique is of particular importance in arid and semiarid zones, where soil moisture is often the limiting factor. The author also discusses results of his statistical investigation of methods for estimating soil moisture and evaporation from standard climatic data. A versatile soil moisture budget (VB) technique is discussed which accounts for most of the requirements for earlier and generally more difficult meteorological budgeting methods. Using coefficients developed for several soil zones, correlation coefficients of .90 were obtained between soil moisture estimates using VB and soil moisture block readings. Daily soil moisture under wheat on a zone-by-zone basis was estimated by VB method and checked closely with measured soil moisture. VB generally provided good estimates even at different locations. Some discrepancies were noted in estimates for lower soil zones on days of peak water loss. This suggests that during drought plants are able to utilize available water in lower zones more efficiently than they do in periods of uniform moisture distribution. (Crouse-Arizona)

MAGADIITE FROM ALKALI LAKE, OREGON,
Air Force Cambridge Research Center, Bedford, Mass.; Geological Survey, Washington, D.C.; and Air Force Academy, United States Air Force Academy, Colo.
Thomas P. Rooney, Blair F. Jones, and James T. Neal.
The American Mineralogist, Vol 54, p 1034-1043, July-Aug 1969. 10 p, 4 fig, 2 tab, 12 ref.

Descriptors: *Water chemistry, *Chemical precipitation, *Sodium compounds, *Silicates, *Playas, *Oregon, Mud, Geology, Mineralogy, Aqueous solutions, Brines, Mud flats.
Identifiers: Magadiite, Alkali Lake (Ore).

Magadiite (a hydrous sodium silicate) has been identified in veins cutting playa sediments and in muds associated with alkali salts and brines at Alkali Lake playa, Oregon. Magadiite has apparently precipitated directly from solution, perhaps as a result of pH changes on dilution by runoff. The magadiite veins may be related to syneresis cracking in very fine-grained playa sediments derived from acid volcanics. (Knapp-USGS)

Descriptors: *Fertilization, *Nitrogen, *Phosphorus, *Potassium, Hydrogen ion concentration, Fish, Lakes, Productivity, Brook trout, Shallow water, Sampling.
Identifiers: New Brunswick, Nova Scotia, Infertile waters, Enrichment, Ammonium phosphate, Potassium chloride, Bottom fauna, Microcrustacea, Crecy Lake (N B Canada), Salvelinus fontinalis, Anabaena blooms.

Addition of one ton of mono-ammonium phosphate and 500 pounds of potassium chloride to infertile 20-hectare lake increased the planktonic biomass and benthic organisms, largely Hyalella. The development of a heavy bloom of Anabaena appeared to have a deleterious effect on microcrustaceans. The soluble fraction of the introduced phosphate was rapidly decreased by biofixation from about 0.4 parts per million to 0.03 parts per million. (Wilde-Wisconsin)

COMPOSITION AND HORIZONTAL DISTRIBUTION OF CRUSTACEAN PLANKTON IN LAKE ONTARIO,
Fisheries Research Board of Canada, Winnipeg (Manitoba). Freshwater Inst.
K. Patalas.
Journal Fisheries Research Board of Canada, Vol 26, No 8, p 2135-2164, 1969. 23 fig, 1 tab, 23 ref.

Descriptors: *Distribution patterns, *Lake Ontario, *Plankton, Daphnia, Sampling, Crustaceans, Copepods.
Identifiers: *Horizontal distribution, *Crustacean plankton, Bosmina, Cyclops, Ceriodaphnia, Tropocyclops, Vertical distribution, Sampling stations, Cladocera.

Distribution of zooplankton was ascertained through collections from June-October 1967 as part of an effort to characterize the biological communities of the Great Lakes relative to natural and cultural eutrophication processes. Eleven species of copepods and cladocerans were found; most abundant forms being species of Cyclops, Daphnia, Bosmina, Tropocyclops, and Ceriodaphnia. Bosmina longirostris and Cyclops bicuspidatus were most abundant cladocerans and copepods, respectively, in summer plankton. Most species appeared in June-July at eastern end of lake, zones of abundance later expanding westward. In September, some species (Bosmina, Ceriodaphnia) occurred mainly in western end, disappearing from the east. Others (Daphnia, Cyclops) were distributed over entire lake, inclined to concentrate in offshore regions. In October, most species had decreased in western end with a slight increase in abundance in the eastern end, tending to a more uniform lakewide distribution. Total plankton concentration was highly correlated (coefficient of correlation, $r = 0.80$, degrees of freedom approximately 13) with heat content (kilocalories/square centimeter) of water. Thermal structure of lake is wind-generated. Graphical data include seasonal distribution maps of dominant zooplankters, and

detailed study of effects of Toronto Harbor on localized zooplankton populations. (Voigtlander-Wisconsin)

WATER QUALITY STUDIES ON THE GREAT LAKES BASED ON CARBON FOURTEEN MEASUREMENTS ON PRIMARY PRODUCTIVITY,
Minnesota Univ., Minneapolis.
William G. Parkos, Theodore A. Olson, and Theron O. Odlaug.
Water Resources Research Center, Minnesota Univ Graduate School, Minneapolis, WRRC Bulletin 17, 1969. 121 p, 23 fig, 25 tab, 70 ref, 10 plates, appendix A, B, C, D, E, F. OWRR Project A 011-MINN.

Descriptors: *Primary productivity, Surface waters, Productivity, Phytoplankton, Great Lakes, Lake Superior, Lake Michigan, Lake Huron, Lake Erie, Water quality.
Identifiers: Carbon-14 measurement, Shipboard incubation.

Carbon-14 measurements of surface water primary production of Lakes Superior, Michigan, Huron, and Erie are reported. Estimates are based on shipboard incubation of samples collected at irregular intervals during the 1967 and 1968 shipping seasons. Lake Superior proved to be the least productive of the lakes studied, mean surface productivity of 16.72 milligrams of carbon/cubic meter per day. The other lakes showed increasing levels of productivity: Lake Huron, 23.04 milligrams of carbon/cubic meter per day, Lake Michigan, 37.62 milligrams of carbon/cubic meter per day, and Lake Erie, 175.20 milligrams of carbon/cubic meter per day. Highest productivity levels in each lake tended to occur near large population centers. (Koonce-Wisconsin)

HYDROLOGY OF SMALL WATER AREAS IN THE PRAIRIE POTHOLE REGION,
Geological Survey, Washington, D.C.
W. S. Eisenlohr, Jr.
Canadian Wildlife Service Report Series, No 6, Saskatoon Wetlands Seminar, p 35-39, 1969. 5 p, 2 fig, 2 ref.

Descriptors: *Water balance, *Hydrologic budget, *Lakes, *Ponds, *Playas, Water chemistry, Water quality, Inflow, Evapotranspiration, Limnology, Water levels, Vegetation effects, Sedimentation.
Identifiers: Saskatchewan, Prairie potholes.

The hydrology of prairie potholes is briefly reviewed in a paper presented in a wetlands seminar. Potholes, usually shallow ephemeral lakes, are filled by rainfall on the surface of the lake, seepage, and surface inflow, and empty by seepage, evaporation, and surface outflow. When the soil is frozen it is impermeable and basin inflow takes place easily. If snow melts gradually, much of the water can evaporate. If snow melts after the ground thaws, water can seep into the ground. These conditional effects on the melting of snow can obliterate and even reverse the effects of total seasonal or annual precipitation. Basin inflow will occur only when rain falls on frozen or saturated soil, or at a greater rate than the maximum infiltration capacity of the soil. Soil moisture and to some extent the magnitude of a storm, are the effective controls over the amount of precipitation that becomes basin inflow, and that annual precipitation is meaningless as a measure of water replenishment in a slough. Vegetation affects water loss from a pothole in two ways: (1) it reduces the loss from evaporation by sheltering the water surface from incoming radiation, and (2) it may increase the loss by the amount of water is transpires. Evaporation makes the contents of a slough more saline than the inflow. Overflow, through periodic flushing, may well keep dissolved solids in many potholes from becoming very concentrated. THE LIMNOLOGY OF ONEIDA LAKE - AN INTERIM REPORT,
Geological Survey, Albany, N.Y.
Phillip E. Greeson, and George S. Meyers.
New York Water Resources Commission Report of Investigation RI-8, 1969. 64 p, 23 fig, 13 tab, 53 ref.

Descriptors: *Limnology, *New York, *Eutrophication, *Algae, Water quality, *Nutrients, Waves (Water), Seiches, Water pollution effects, Water pollution sources, Runoff, Agricultural chemicals, Nitrates, Phosphates, Water chemistry.
Identifiers: *Oneida Lake (N Y).

The general concepts of lake eutrophication are discussed and the findings of the first year of field investigations on the eutrophication of Oneida Lake, New York are presented. Routine biological and chemical data revealed that the lake has become eutrophic both through the natural processes of lake aging and from the inflow of nutrient-rich water from the fertile drainage basin. The four most important factors affecting the biological activities within the lake are: (1) the high fertility of the drainage basin, (2) the physical position and shallowness of the lake, (3) mixing of the water by wind action, and (4) the inclusion of bottom sediments in the recycling of nutrient materials. 2I. Water in Plants

LICHENOMETRY TO EVALUATE CHANGES IN GLACIAL MASS BUDGETS: AS ILLUSTRATED FROM NORTH-CENTRAL BAFFIN ISLAND, N.W.T.,
Colorado Univ., Boulder. Inst. of Arctic and Alpine Research; and Colorado Univ., Boulder. Dept. of Geological Sciences.
J. T. Andrews, and P. J. Webber.
Arctic and Alpine Research, Vol 1, No 3, p 181-194, Summer 1969. 14 p, 9 fig, 1 tab, 24 ref.

Descriptors: *Lichens, *Glaciation, *Glaciers, *Arctic, Ice, Sampling, Ablation, History, Mapping, Radioactive dating, Geomorphology, Geology.
Identifiers: *Canada, Baffin Island, *Lichenometry.

Direct measurement of the growth of Alectoria minuscula over 4.3 growing seasons enables a further assessment to be made on the value of lichenometry around the Barnes Ice Cap. Detailed lichen sampling in two formerly glacierized valleys allows isophyses to be drawn for specific diameters of A. minuscula. The gradients of the isophyses are similar to those of lateral glacial features. These reconstructions define ice margins from about 1650 A.D. to the present time and enable glacier changes in length, area, and volume to be estimated for the Lewis and Pintail glaciers. Local differences in the trend of area or volume loss are explained by differences in deglacial history. Specific ablation for the expanded Lewis Glacier below the 500 m ice contour averaged about 1.5 m ice equivalent per year, a value not dissimilar to those determined on the present glacier of about 1.3 m ice equivalent. Sampling over extended distances on substrates of similar age around the Barnes Ice Cap indicates comparable maximum lichen diameters are present. The value of lichenometry in arctic areas is reaffirmed. (Gabriel-USGS)

THE CONTROL OF SEED GERMINATION BY WATER-RELATIONS,
Hebrew Univ., Jerusalem (Israel). Dept. of Botany.
Dov Koller.
Annals of Arid Zone, Vol 6, No 1, p 35-41, Mar 1967. 3 tab, 21 ref.

Descriptors: *Germination, *Seeds, *Soil-water-plant relationships, *Soil moisture, *Inhibitors, Plant physiology, Arid lands, Seed treatment, Moisture availability, Impermeability, Humidity, Air environment, Soil environment, Environment, Vegetation establishment, Permeability.
Identifiers: *Water potential, *Plant survival.

Seeds may come in contact with water under many conditions which are unsuitable for germination and survival. Plants have evolved germination-regulating mechanisms to insure success of the species. The author draws on data of his own and information already in the literature to review and summarize germination-regulating mechanisms actuated by water-relations. Many seeds contain water-soluble inhibitors which leach out of the seed coating only after enough water has flowed past the seed into the soil to assure sufficient moisture availability for successful plant establishment. Some seeds have water-impermeable coasts which become permeable only after exposure to relatively humid conditions for some time period. In arid lands this tends to limit possibility of germination to that season of the year favorable to plant establishment. Seeds of some species are inhibited from germination even in the presence of adequate soil moisture if the water potential is not appropriate for seedling survival. Presence of liquid water in contact with the seed is not sufficient for germination. Atmospheric humidity, cycles of wetting and drying, volume of water passing into the soil and water potential of the medium may all have significant effects on germination. In arid lands or areas subject to periods of drought these mechanisms may be important to survival potential of the species. (Crouse-Arizona)
W70-03235

THE ROOT GENERATING CAPACITY OF SEEDLING TRANSPLANTS AND THE AVAILABILITY OF SOIL MOISTURE,
California Univ., Berkeley.
Edward C. Stone.
Annals of Arid Zone, Vol 6, No 1, p 42-57, Mar 1967. 9 fig, 11 ref.

Descriptors: *Arid lands, *Ponderosa pine trees, *Root development, *Planting management, *Moisture availability, Moisture stress, Soil-water-plant relationships, Semiarid climates, Plant growth, Field capacity, Soil environment, Timing, Temperature, Forestry, Forest Management, Coniferous trees, Plant physiology.
Identifiers: *Seedlings, *Plant survival.

Survival of forest tree seedlings planted in arid or semiarid climates is highly dependent on root

growth during the first growing season after planting. In the case of bare root seedlings, new root growth is strongly dependent on available soil moisture and physiological potential of the plant to grow new roots rapidly. The author tested several conifer species but found that only one, Pinus ponderosa Laws. (Ponderosa pine) seemed to have potential for survival under arid conditions. This paper presents a summary of recent literature on root growth potential of bare-root nursery stock and the author's own research into the root regenerating potential (RRP) of ponderosa pine. Since it is not always possible in arid and semiarid lands to plant when the soils are at or near field capacity, the author conducted studies of the RRP of ponderosa pine in soil at 100, 50, and 20% initial available soil moisture. A simple assessment technique is presented for determining effects of nursery location and cultural practices of the RRP of seedlings. It should also be possible to estimate survival rate of seedlings at various planting sites if soil moisture and temperature sequences of the site are known. By establishment of nurseries at different locations it should be possible to produce seedlings with a high RRP for planting at different times. (Crouse-Arizona)
W70-03236

WATER MOVEMENT IN INJECTED TREES,
Bartlett Tree Research Labs., Stamford, Conn.
Johnson Parker.
Annals of Arid Zone, Vol 6, No 1, p 58-65, Mar 1967. 4 tab, 7 ref.

Descriptors: *Droughts, *Absorption, *Deciduous trees, *Plant physiology, *Translocation, Plant diseases, Nutrients, Dye releases, Tracers.
Identifiers: *Plant water movement.

Drought with resulting soil moisture stress is thought to be a cause of several diseases of broadleafed deciduous trees. The author reports a study of the movement of water injected into trees as one step toward better understanding of this procedure. Distilled water was injected into 6 species: white oak, beech, red maple, red oak, American elm, and ash. Different species absorbed substantially different amounts of water although the amount varied widely among different trees of the same species and on the same tree on different days. Dyed water moved both up and down but tended to remain in a narrow path in the ring porous species, while in diffuse porous species it spread laterally about one inch for each foot of travel. Addition of any dissolved substance, even nutrient solutions, caused a sharp drop in the rate of water uptake. (Crouse-Arizona)
W70-03237

INTERRELATIONSHIP OF HABITAT TO GROWTH AND COMPOSITION OF ZIZYPHUS NUMMULARIA,
Central Arid Zone Research Inst., Jodhpur (India).
P. C. Nanda.
Annals of Arid Zone, Vol 6, No 1, p 66-73, Mar 1967. 4 tab, 2 ref.

Descriptors: *Arid lands, *Plant morphology, *Soil moisture, *Storage capacity, *Soil-water-plant relationships, Environmental effects, Moisture stress, Plant growth, Moisture availability, Soil types, Leaves, Water storage, Sands, Soil environment, Seasonal, Variability, Moisture content.
Identifiers: *India, Fruits, Rocky soils.

In arid lands available soil moisture becomes very low during long periods without precipitation. Plants are therefore growing under conditions of moisture stress. The author studied effects of moistures stress on the native species Zizyphus Nummularia on both deep sandy soil and a shallow rocky soil. The rocky soil had a higher moisture content during the rainy season, but because of greater total storage capacity, the sandy soil had more reserve moisture during long dry seasons. Plants on the sandy soil had less moisture content in leaves and smaller fruits. The sandy site plants put on new leaves and smaller fruits. The sandy site plants put on new leaves and developed flower buds two months earlier than plants on the rocky site. Plants on the sandy site retained leaves throughout the year whereas plants on the rocky soil dropped all leaves during the later months of the dry season. In general plants on sandy soils grew longer and faster than those on the rocky soil. There were distinct morphological differences between the same species grown on the two soil types. 2J. Erosion and Sedimentation

PRESENT RATE OF LAND EROSION,
University of East Anglia, Norwich (England). School of Environmental Sciences.
Anthony Young.
Nature, Vol 224, No 5222, p 851-852, Nov 29, 1969. 2 p, 2 fig, 41 ref.

Descriptors: *Erosion, *Geomorphology, *Land forming, Sediment load, Slopes, Topography, Cultivated lands, Sediment yield.
Identifiers: *Erosion rates.

Available estimates of the average worldwide erosion rate are reviewed. If results are divided into normal and steep relief groups, a clear difference in rates appears; normal or gentle slopes erode about 46 mm/1000 yr and steep slopes erode about 500 mm/1000 yr. These results are comparable with estimates based on sediment loads in streams. Agricultural land erosion is somewhat faster than the erosion of uncultivated land and this must be taken into account in estimating erosion rates in most areas. (Knapp-USGS)

SEDIMENT TRANSPORT BY STREAMS IN THE WALLA WALLA RIVER BASIN, WASHINGTON AND OREGON, JULY 1962 - JUNE 1965,
Geological Survey, Washington, D.C.
B. E. Mapes.
Report available from Superintendent of Documents, US Government Printing Office, Wash, DC, 20402 - Price 60 cents (paper copy). Geological Survey Water-Supply Paper 1868, 1969. 32 p, 7 fig, 1 plate, 7 tab, 18 ref.

Descriptors: *Sediment transport, *Washington, *Bed load, *Suspended load, Sediment yield, Provenance, Sediments, Alluvium, Particle size, Sands, Silts, Clays, Data collections, Hydrologic data, Streamflow, Geology, Topography, Climates.
Identifiers: *Walla Walla River basin (Wash-Ore).

The Walla Walla River basin covers about 1,750 square miles in southeastern Washington and northeastern Oregon. The mountainous eastern part of the basin is underlain at shallow depth by basalt which has a residual soil mantle. The slopes are characterized by alluvial fans and deeply cut stream valleys filled with sand, gravel, and cobbles. Average annual sediment yields ranged from 420 tons per sq mi in the mountainous area to more than 4,000 tons per sq mi in the extensively cultivated northern and central parts. The highest concentrations were contributed by the loessal deposits in the Dry Creek drainage. Two runoff events resulting from rain and snowmelt on partially frozen ground produced 76% of suspended sediment discharged. Daily suspended-sediment concentrations for the Walla Walla River near Touchet exceeded 700 mg/l about 10% of the time, and 14,000 mg/l about 1% of the time. The mean concentration was 7,000 mg/l. Silt predominates in the suspended sediment. The bedload in the mountain and upland streams was about 5-12% as much as the suspended load. In the lower basin area, the bedload was about 2-8% as much as the suspended load. (Knapp-USGS)

RESPONSE OF A LABORATORY ALLUVIAL CHANNEL TO CHANGES OF HYDRAULIC AND SEDIMENT-TRANSPORT VARIABLES,
Geological Survey, Washington, D.C.
R. E. Rathbun, H. P. Guy, and E. V. Richardson.
Report available for sale by the Superintendent of Documents, US Government Printing Office, Wash, DC, 20402 - Price $0.40 (paper cover). Geological Survey Professional Paper 562-D, p D1-D32, 1969. 32 p, 21 fig, 4 tab, 24 ref.

Descriptors: *Sediment transport, *Bed load, *Model studies, *Hydraulic models, *Flumes, Equipment, Instrumentation, Research and development, Calibrations, Sands, Sediments, Laboratory tests, Pumps.
Identifiers: *Sedimentation flumes, Recirculating flumes, Sediment-feed flumes.

The feed and recirculation systems of experimental sediment-transport flume operation were compared in a series of experiments conducted in a tilting plastic flume 10 meters long, 20 centimeters deep, and 20 centimeters wide. No significant differences were observed in the mean values of the sediment-transport rate, water-surface slope, depth of flow, and mean velocity for the two systems in the equilibrium steady state. The responses of the laboratory alluvial channel with a constant water discharge to changes of sand-bed slope, tail-water depth, and sediment-transport rate were determined. The recirculation system has the advantage of ease and economy of operation, and the feed system has the advantage of direct quantitative control of the sediment-transport rate. (Knapp-USGS)

STANDARDIZATION OF PARTICLE-SIZE RANGES.
American Society of Civil Engineers, New York.

ASCE Proceedings, Journal of the Soil Mechanics and Foundations Division, Vol 95, No SM5, Paper 6795, p 1247-1252, Sept 1969. 6 p, 3 ref.

Descriptors: *Particle size, *Sediments, *Standards, Materials, Materials testing, Clays, Sands, Silts, Sedimentology.
Identifiers: Particle size standards.

A committee was formed of members of several scientific and technical societies to recommend particle size standards acceptable for the common use of their members. After considering the positions of the participating societies, the Intersociety Committee reached agreement on a joint statement regarding the status of grain-size classes for sand, silt, and clay. The upper size limits in mm of clay, silt and sand fractions now in common use are as follows: clay = 0.002, 0.0039, and 0.005; silt = 0.05 (No 270 sieve), 0.0625 (No. 230 sieve), and 0.074 (No. 200 sieve); sand = 2.0 (No. 10 sieve) and 4.76 (No. 4 sieve). The prospects of attaining agreement on the upper size limits of clay seems good and we recommend the 0.002 mm limit. The possibilities of attaining agreement on the upper size limit of silt are slight to moderate, 0.0625 mm and 0.074 mm seem reasonable alternatives, with slight preference for the 0.074 limit. The prospect of attaining agreement on the upper sand size limit seems moderate to good and the 2.0 mm limit is recommended. (Knapp-USGS)
W70-03093

SEDIMENTATION IN UPPER STONY CREEK BASIN, EASTERN FLANK OF THE COAST RANGES OF NORTHERN CALIFORNIA,
Geological Survey, Washington, D.C.
J. M. Knott, and C. A. Dunnam.
Report available for sale by Superintendent of Documents, US Government Printing Office, Wash, DC, 20402 - Price $0.25 for paper copy. Geological Survey Water-Supply Paper 1798-F, p F1-F35, 1969. 35 p, 11 fig, 9 tab, 20 ref.

Descriptors: *Sedimentation, *Small watersheds, *Reservoir silting, *California, Suspended load, Bed load, Sediment transport, Streamflow, Storm runoff, Stream erosion, Sediment yield.
Identifiers: Coast Ranges (Calif).

Sediment surveys in 1960 and 1962 indicated that the average annual rate of accumulation in East Park Reservoir, California during the period 1910-62 was 0.37 acre-ft per sq mi of drainage area and that in Stony Gorge Reservoir during the period 1928-62 it was 0.27 avre-ft per sq mi. Maximum deposition occurred in the deeper parts of the reservoirs along prereservoir stream channels. Storage capacity of both reservoirs has been depleted approximately 0.1% per year by sediment deposition. Estimates of suspended-sediment discharge were made from periodic measurements on Stony Creek at Black Butte Dam. Annual sediment yield at this site averaged 0.93 acre-ft per sq mi during the 6-year period 1957-62. Most of the sediment load of Stony Creek and its tributaries is transported during periods of storm runoff. The sediment is predominantly of silt and clay size (less than 0.062 mm). Bedload discharge is a minor part of the Stony Creek sediment discharge. The bedload, as computed by 3 procedures (Einstein, Meyer-Peter and Muller, and Schoklitsch), was 1-6% of the suspended load. (Knapp-USGS)
W70-03099

HYDROMORPHOLOGICAL PRINCIPLES OF COMPUTATIONS OF FREE MEANDERING: 1. SIGNS AND INDEXES OF FREE MEANDERING,
N. Ye. Kondrat'yev.
Trans from Trudy GGI, No 155, p 5-38. Soviet Hydrology: Selected Papers, No 4, p 309-335, 1968. 23 fig, 5 tab, 10 ref.

Descriptors: *Channel morphology, *Meanders, Rivers, Equations, Channels, River flow, Sediment transport, Stream erosion, Alluvial channels, Sedimentary structures.
Identifiers: USSR, Channel geometry.

Four major topics dealing with free meandering are quantitatively treated. These topics are: (1) Signs and indexes of free meandering; (2) horizontal deformation of meanders during free meandering; (3) structure of the velocity field of flow in a meander of a river; and (4) computations of the deformations of a meander in free meandering. The following methods of computations are presented: (1) Computation of horizontal deformations; (2) formula for constructing the axial line of channel; (3) computation of the horizontal position of a pool hollow by Garbrecht's method; and (4) computation of the pool hollow in a single-pool meander. These methods are compared and their advantages and limitations are discussed. (Carstea-USGS)
W70-03107

DISCHARGE OF SUSPENDED SEDIMENTS IN THE DON RIVER,
V. V. Krayushin.
Transl from GGI, Sbornik Rabot po Gidrologii, No 8, p 144-151, 1968. Soviet Hydrology: Selected Papers, No 4, p 400-407, 1968. 3 fig, 7 tab, 9 ref.

Descriptors: *Sediments, *Sediment transport, Rivers, Reservoirs, Sediment discharge, Hydraulic structures, Discharge (Water), River flow, Trap efficiency, Silting, Reservoir silting.
Identifiers: *USSR, Don River, Tsimlyansk Reservoir.

The channel formation process and the operating conditions of many hydraulic installations are affected by the magnitude and regime of sediment discharge. Discharge of suspended sediment in the Don River is examined under a natural regime and with the Tsimlyansk Reservoir as a sediment accumulator. Although the suspended sediment discharge depends mainly on water discharge, there is no strict proportionality between these two parameters. The Tsimlyansk Reservoir is essentially a sediment trap for the upper, middle, and lower Don. The computations show that about 17 to 82% of the annual discharge of suspended sediments is lost at the present time in the Tsimlyansk Reservoir. (Carstea-USGS)
W70-03111

COMPUTATION OF RESERVOIR SEDIMENTATION WITH SUSPENDED LOAD (CZECH),
Jaroslav Sumbal.
English summary. Vyskumny Ustav Vodneho Hospodarstva, Bratislava, Prace a studie 51, 1968. 65 p, 19 fig, 6 tab, 15 ref.

Descriptors: *Reservoir silting, *Sedimentation, *Suspended load, *Mathematical studies, Forecasting, Water levels, Analog computers, Discharge (Water), Mapping, Hydraulic models.
Identifiers: Reservoir sedimentation.

Reservoir silting is analytically investigated on the basis of G. I. Samov's method (1954). The computation of silting is based on the assumption that the fall velocity of the suspended load particles in turbulent flows can be expressed mathematically as a function of some critical velocity. The solution of final equations derived by using this technique, by nomograms, numerically, and by analog computer yields probable heights and spatial distribution of sediments in water reservoirs. Oregon State Univ., Corvallis.
Robert V. Klucas.
Proceedings of the Eutrophication-Biostimulation Assessment Workshop, June 19-21, 1969, California Univ, Berkeley, Sanitary Engineering Research Lab and National Eutrophication Research Program, Corvallis, Ore, Pac Northwest Water Lab, p 109-116. 2 tab, 30 ref.

Descriptors: *Nitrogen fixation, *Assay, Eutrophication, Aquatic environment, Microorganisms, Enzymes, Ammonia, Radioisotopes, Bacteria, Cyanophyceae, Lichens, Clostridium, Azotobacter.
Identifiers: *Acetylene reduction, Free-living systems, Ethylene, Symbiotic systems, Root nodules, Root-associated, Rhodospirillum rubrum, Anabaena cylindrica, Anabaena flos-aquae, Calothrix, Gloeotrichia echinulata, Nostoc entophytum, Nostoc muscorum, Mastigocladus laminosus, Tolypothrix tenuis, Glycine max, Myrica cerifera, Phaseolus vulgaris, Medicago sativa, Arachis hypogea, Pisum sativum, Comptonia peregrina, Alnus rugosa, Cycas revoluta, Zamia floridana, Collema, Peltigera, Pseudocyhel-

laria, Clostridium pasteurianum, Azotobacter Chroococcum, Azotobacter vinelandii.

Biological nitrogen fixation is the enzymic conversion of molecular nitrogen to ammonia. Growth on nitrogen-free medium has been used for screening for nitrogen fixing agents, but this method lacks sensitivity and requires extended investigative periods. The nitrogen-fixing complex reducing acetylene to ethylene is the basis for a new and sensitive assay for nitrogen fixation. The procedure exposes the organism to be tested to acetylene, incubating and analyzing the gas phase for ethylene. Of numerous methods used to measure ethylene, one especially sensitive method is by hydrogen-gas flame ionization gas chromatography. Evidence suggests that acetylene is reduced by nitrogenase. Acetylene reduction assay for nitrogen fixation has been used successfully with a number of free-living and symbiotic systems. The simplicity, sensitivity, and rapidity of the method is particularly adaptable to field investigations where numerous samples must be analyzed. One aspect of eutrophication is the nitrogen input into the aquatic environment; although many sources contribute to nitrogen increase, in situ fixation by microorganisms certainly is involved in this input. With the acetylene reduction assay, a simple and sensitive method is available for ascertaining the amount of nitrogen fixation in aquatic ecosystems. (See Vol 3, No 7, entry W70-02775). GEOCHEMISTRY AND HYDROLOGY OF A SMALL BASIN IN THE UPPER BUFFALO RIVER WATERSHED, TENNESSEE,
Vanderbilt Univ., Nashville, Tenn., and Tennessee Div. of Water Resources, Nashville.
Richard G. Stearns, and John M. Wilson.
Interim Report, Tennessee Water Resources Research Institute, 1969. 3 p. OWRR Project A-011-TENN.

Descriptors: *Geochemistry, *Small Basin, *Hydrology, Rainwater, Groundwater, Surface Water, Weathering, *Leaching, *Precipitation, *Cherty Limestone, Soil, Residuum.

Passing through soil, rainwater pH drops 7 to 5 (CO_2 added); silica increases from 1 to 5 ppm, and calcium decreases from over 10 to less than 1 ppm. (Source of 'fallout' calcium is a mystery.) Groundwater regains calcium (to 50 or more ppm) and picks up more silica (to nearly 10 ppm) in the residuum. The surface stream is low in hardness (7 ppm) and pH (about 6) until it intersects permanent springs where it gains calcium (to 40 ppm) and pH increases (to about 7), as it mixed with groundwater that had been in contact with bedrock. Iron appears to be depositing at 4 pounds per acre per year. Silica appears to be carried away at 30 pounds per acre per year, and calcium at 8 pounds. Bedrock consists mainly of the minerals quartz, calcite and dolomite (cherty dolomitic limestone). Soil and residuum are impoverished in all but quartz, and there is an abrupt contact with a chert layer on bedrock. Groundwater percolates down to the top of rock where it moves laterally. Chert layers at least partially protect bedrock calcite from solution.

CHEMICAL QUALITY OF WATER IN NORTHERN NIGERIA, 1965-1968,
Geological Survey, Kaduna (Nigeria).
Raymond T. Kiser
Geol Surv Open-file Report, Dec 1968. 41 p, 1 fig, 6 tab, 7 ref.

Descriptors: *Water resources, *Surface waters, *Groundwater, *Water quality, Streamflow, Water wells, Springs, Water yield, Water utilization, Stock water, Domestic water, Irrigation water, Hydrologic data, Data collections.
Identifiers: *Nigeria.

More than 300 complete chemical analyses of water samples were collected during the period July 1965 to August 1968 from widespread sources in northern Nigeria. Most of the samples were obtained from groundwater sources, lakes, ponds, and streams in the Chad, West Chad, and Sokoto basins, Kerri Kerri area, Kaduna-Zaria area, and other scattered localities. The waters vary widely in dissolved solids concentration and chemical type, but most sources are suitable for livestock and man. Nearly half the water samples, however, from dug wells in West Chad basin and Kerri Kerri area have high nitrate, and many water sources from boreholes (drilled wells) in Chad and Sokoto basins have undesirable amounts of iron or manganese. Some groundwater sources, particularly in the Chad basin, are limited in their suitability for irrigation use because of salinity, sodium, or bicarbonate hazards. (Knapp-USGS)

DISCHARGE OF DISPERSED AND RARE ELEMENTS (MICROELEMENTS) IN SOLUTION AND IN SUSPENDED SUBSTANCES FROM THE TERRITORY OF THE USSR,
Nauchno Issledovatelskii Gidrokhimicheskii Institut, Novocherkassk (USSR).
A. A. Ivanova, and G. S. Konovalov.
Transl from Gidrokhimicheskiye Materialy, Vol 44, p 63-82, 1968. Soviet Hydrology: Selected Papers, No 4, p 336-353, 1968. 1 fig, 1 tab, 9 ref.

Descriptors: *Trace elements, *Water chemistry, *Water quality, Rivers, Watersheds (Basins), Cobalt radioisotopes, Copper, Molybdenum, Sediments, Manganese, Geochemistry.
Identifiers: *USSR, Silver, Vanadium, Nickel, Lead, Zinc.

Mechanical, physical, chemical, and biological processes taking place in a hydrographic basin are usually reflected in the amount of microelements removed from the land. The magnitude of the removal is also determined by the chemical properties of the elements themselves. Mountain rivers remove most of the microelements in suspension. In contrast, lowland rivers frequently remove microelements in solution. The USSR discharge of vanadium, manganese, cobalt, nickel, copper, zinc, lead, silver, and molybdenum is computed. The total amount of these elements which are removed into the sea is approximately 1,096,000 tons/year. Only one-fifth of this amount is removed in solution. (Carstea-USGS)

HYDROCHEMICAL STUDY OF ATMOSPHERIC PRECIPITATION,
P. P. Voronkov.
Transl from GGI, Sbornik Rabot po Gidrologii, No 8, p 67-81, 1968. Soviet Hydrology: Selected Papers, No 4, p 381-392, 1968. 6 tab, 14 ref.

Descriptors: *Water chemistry, *Water quality, *Precipitation (Atmospheric), Dust storms, Soils, Agricultural watersheds, Forest soils, Soil chemical properties, Snow cover.
Identifiers: *USSR, Kazakhstan, Altai.

The chemical composition of precipitation can change very rapidly in the southern regions of the USSR. In contrast, precipitation retains its characteristic chemical features for a long time in the northern regions. The upper soil layer can become a source of pollution of the air layer near the ground, as illustrated by observations in one of the lowland regions of the Altai. Significant differences were measured in the chemical composition of field and forest snow, and were attributed to soil dust. The snow water from the field had a much higher content of bicarbonate, Ca, and pH than the snow from forested land. Differences in the chemical composition of water obtained from the upper and lower snow layers are discussed for the steppe regions of Kazakhstan. The mineralization of water increased from upper to the lower snow layers. Examples from other geographic regions are given. (Carstea-USGS)

GEOLOGICAL SIGNIFICANCE OF NORTH SEA SAND TRANSPORT RATES,
National Inst. of Oceanography, Wormley (England).
M. A. Johnson, and A. H. Stride.
Nature, Vol 224, No 5223, p 1016-1017, Dec 6, 1969. 2 p, 1 fig, 4 ref.

Descriptors: *Sediment transport, *Sands, *Bottom sediments, *Tidal waters, *Ocean currents, Tidal effects, Bed load, Sand waves, Ripple marks, Sediment yield, Provenance.
Identifiers: *North Sea, *Netherlands, *England.

In the southern part of the southern bight of the North Sea, tidal currents reach peak speeds of about 2 knots and the sea floor is composed of medium sand in large waves transverse to the flow. In the northern part, tidal currents are weaker and the floor of well-sorted fine sand is flat or ripple marked. The net sand transport is south to north, with erosion in the south and deposition in the northern reaches. Water depth is about 80-120 ft., both tidal and wind-driven currents are important. Transport rates obtained by use of a theoretical model using estimated currents, results of lab studies, wave measurements, and sedimentation data are consistent with quantitative data on sea floor changes. The small steady transport rate can be obscured by large storm flow events, but it is quantitatively more significant over long periods. The yearly net sand transport is about 2.4 million cubic meters. (Knapp-USGS)

CALORIC AND CARBON EQUIVALENTS OF ZOOPLANKTON BIOMASS,
Fisheries Research Board of Canada, Dartmouth (Nova Scotia). Marine Ecology Lab.
Trevor Platt, Vivien M. Brawn, and Brian Irwin.
Journal Fisheries Research Board of Canada, Vol 26, No 9, p 2345-2349, 1969. 1 fig, 11 ref.

Descriptors: *Biomass, *Carbon, *Methodology, Zooplankton.
Identifiers: Caloric equivalents, Energy flow, Predictive equations, Second-order equations.

On the basis of zooplankton samples analyzed for caloric content, carbon, and ash, the dependence of caloric content of zooplankton (y) on percent organic matter (x) was described by the quadratic equation y = -3370 + 136x --0.514 x-squared. Carbon content and caloric content were highly correlated r = 0.94, 21 degree of freedom. Variation in energy equivalent of zooplankton (calorie/gram dry weight) was fivefold; variation appears as result of changing age distributions and species composition among plankton. Carbon content can be used as a reliable predictor of energy equivalent by the equation calorie/gram dry weight = -227 + 152 (% carbon). Multiple correlation coefficient among calories, carbon content, and ash was 0.98 (16 degree of freedom). Where carbon and ash contents are known, caloric content is predicted by the equation calorie/gram dry weight = 1351 + 106 (% carbon) -21.2 (% ash), with standard error of estimate being 253 calories. The seasonal variations in caloric content (fivefold variation caloric variation versus 14-fold variation in dry weight) suggest an expression of a compensatory mechanism in energy flow. EVALUATION OF FLOW IN TIDAL REACHES OF THE CONNECTICUT RIVER BY MATHEMATICAL MODEL,
Geological Survey, Washington, D.C.; and Geological Survey, Hartford, Conn.
Chintu Lai, Frederick H. Ruggles, and Lawrence A. Weiss.
Paper presented at 50th Annual Meeting of American Geophysical Union, Wash, DC, Apr 21-25, 1969. 16 p, 9 fig, 4 tab.

Descriptors: *Estuaries, *Rivers, *Mathematical models, River flow, Model studies, Water supply, Sewage disposal, Unsteady flow, Boundaries (Surfaces), Discharge (Water), Tidal waters, Channel morphology, Theoretical analysis.
Identifiers: Connecticut River, Characteristics method.

The Connecticut River has been used for many years for domestic and industrial water supplies, sewage disposal, agriculture, and recreation. The growing economic importance of this river has increased the demand for more reliable flow information in the estuary. Because of the unsteady nature of the flow, there are only limited streamflow data available prior to 1965, which probably limited the ability of engineers to design facilities to properly utilize its water. Research work in the field of unsteady open-channel flow led to digital models using mathematical methods, such as the method of characteristics. The unsteady flow computation using this technique was first performed for a short reach and extended later to a much longer reach. This mathematical method requires boundary value and channel geometry data as computer inputs. In addition, occasional discharge measurements through tidal cycles are necessary to determine essential coefficients and parameters, and to provide a means for checking the accuracy of modeling. With such a theoretical analysis of unsteady flow, the following stream hydrology data are now economically obtainable for engineering design: space- and time-wise variations of stage, velocity, and discharge; volume interchange; water-surface profile and its movement; and flushing time. (Carstea-USGS)

3A. Saline Water Conversion

THERMOSORB PROCESS FOR DESALTING WATER,
Marquardt Co., Van Nuys, Calif.
A. W. Venolia.
Report available for sale from Superintendent of Documents, US Government Printing Office, Wash, DC, 20402 - Price $0.65. Office of Saline Water Research and Development Progress Report No 502, Dec 1969. 67 p, 33 fig, 10 tab, 13 ref. OSW Contract No 14-01-0001-1469.

Descriptors: *Desalination processes, *Activated carbon, *Resins, *Ion exchange, Separation techniques, Economic efficiency, Temperature, Thermal capacity, Aqueous solutions, Methodology, Sodium chloride, Feeding rates.
Identifiers: *Thermosorb process, Aqueous sodium chloride, Kinetic technique.

Experimental results are described that indicate carbon beds provide an attractive alternative to desalting with thermally cycled ion exchange resins. Inexpensive raw materials were used with moderate temperatures. No evidence of a durability problem was encountered in an uninterrupted desalting run of more than 2000 hr. Beds of salt-sorptive carbons appear to be competitive with the resin beds on the basis of effective capacity per weight of sorbent. Carbons probably will outperform ion exchange resins on the basis of initial cost and durability. (Lang-USGS)

GRAPHITIC OXIDE CONTAINING REVERSE OSMOSIS MEMBRANES,
Westinghouse Electric Corp., Pittsburgh, Pa.
L. C. Flowers, P. K. Lee, E. S. Bober, M. H. Gjertsen, and Daniel Berg.
Rep avail for sale by Superintendent of Documents, US Government Printing Office, Wash, DC, 20402 - Price $1.75. Office of Saline Water Research and Development Progress Report No 418, Apr 1969. 202 p, 33 fig, 27 tab, 28 ref, 1 append. OSW Contract No 14-01-0001-550.

Descriptors: *Membranes, *Reverse osmosis, *Desalination processes, Clays, Clay minerals, Bentonite, Temperature, Acidity, Salts, Ions, Feeding rates, Sodium chloride, Membrane processes.
Identifiers: *Graphitic oxide membranes, Salt rejection efficiency, Vermiculite membranes, Bentonite membranes.

Reverse osmosis membranes containing graphitic oxide and membranes formed from bentonite and vermiculite were tested. The graphitic oxide membranes were tested by varying the temperature, pH, sodium chloride concentration and salt-ion valence of the feed solutions. These membranes showed a decrease in salt rejection from 85-90% to 75% with time, while flux increased from 2-5 to 7-10 gpd per sq ft. Aging may be the reason for the changed performance. Bentonite membranes with sodium hexametaphosphate or tannic acid as edge modifier had a rejection efficiency of 57% and 60% respectively. The efficiencies of vermiculite membranes were approximately 10%. (Carstea-USGS)

STUDY OF METHODS TO RETARD COMPACTION OF CELLULOSE ACETATE MEMBRANES IN REVERSE OSMOSIS DESALINATION,
DeBell and Richardson, Inc., Hazardville, Conn.
Bernard Baum, Stanley A. Margosiak, and William H. Holley.
Rep avail for sale by Superintendent of Documents, US Government Printing Office, Wash, DC, 20402 - Price $0.70. Office of Saline Water Research and Development Progress Rep No 467, Oct 1969. 75 p, 13 fig, 17 tab, 18 ref, 2 append. OSW Contract No 14-01-0001-1177.

Descriptors: *Reverse osmosis, *Desalination processes, *Membranes, Cellulose, Pigments, Reinforcement, Permselective membranes, Permeability, Desalination apparatus, Compaction, Aluminum, Silicates.
Identifiers: *Cellulose acetate membrane, Unfilled membrane, Burgess KE reinforced membrane.

Cellulose acetate can be effectively crosslinked with hexamethoxymethyl melamine, acetyl acetonate titanium chelate, sodium dichromate, or lead oxide to prevent desalination membrane compaction. Only pigment reinforcement was promising in preventing the creep of pastics under mechanical stress. Flat membranes were tested for salt rejection, intrinsic salt permeability, intrinsic water permeability, and thickness before and after desalination use in a high-pressure reverse osmosis desalination apparatus. The following types of membranes were used in experimental work: (1) unfilled membranes; (2) Burgess KE reinforced membranes and (3) Burgess KE reinforced and coated membranes. Burgess KE on anhydrous, organic-coated aluminum silicate was the most effective pigment tried for reducing wet compressive creep. (Carstea-USGS)
W70-02846

ULTRASONIC DETECTION OF CALCIUM SULFATE SCALE ON METAL SURFACES,
Midwest Research Inst., Kansas City, Mo.
Fred R. Rollins, Jr.
Rep avail for sale by the Superintendent of Documents, US Government Printing Office, Wash, DC, 20402 - Price $0.50. Office of Saline Water Research and Development Progress Rep No 444, June 1969. 39 p, 22 fig, 4 ref. OSW Contract No 14-01-0001-1718.

Descriptors: *Calcium sulfate, *Scaling, *Analytical techniques, *Desalination, Instrumentation, Heat transfer, Water temperature, Velocity, Research and development.
Identifiers: Ultrasonic detection, Transducers, Scale detection.

A study of ultrasonic reflectivity at liquid-metal interfaces where calcium sulfate scale is present led to a technique useful for fixed-station scale detection in saline water conversion plants. Small high-temperature transducers can be soldered directly to the outside surface of heat-transfer tubes. With suitable electronic gear, the system provides nearly exponentially decaying echo trains at frequencies from a few megahertz up to 20 MHz. These echo trains remain remarkably stable at water temperatures as high as 280 deg F and flow velocities of 3 ft/sec. The decay rate of the echo train is strongly affected by the presence of scale on the inside surfaces of the heat transfer tube. The sensitivity of the technique for scale detection increases with increased frequency; but problems such as attenuation by water ultimately set an upper limit on a practical frequency. The decay rate also depends on the exact nature of the scale. The technique appears to be capable of detecting deposits with thicknesses of 1 mil or more.

STUDY OF 250-MGD MULTISTAGE FLASH DISTILLATION PLANT WITH TWO-LEVEL BRINE FLOW: PART 1. DESIGN AND COST ESTIMATE.
Oak Ridge National Lab., Tenn.

Rep avail for sale by Superintendent of Documents, US Government Printing Office, Wash, DC, 20402 - Price $3.50. Office of Saline Water Research and Development Progress Rep No 389, Mar 1969. 78 p, 2 fig, 8 tab, 3 ref, 2 append. ORNL-OSW Agreement No 14-01-0001-534.

Descriptors: *Cost analysis, *Desalination processes, *Desalination plants, Brines, Flow, Capital costs, Economics, Design criteria, Distillation.
Identifiers: Multistage flash distillation plants, Oak Ridge National Laboratory.

Cost estimates were obtained for a 250-mgd multistage flash desalination plant designed by the Oak Ridge National Laboratory. Development of design criteria was based on the assumption that the plant would be located in southern California. Preparation of cost estimates included capital, operating and maintenance costs. A 250-mgd multistage flash desalination plant can be built at a cost of $149,725,000. Annual operating costs with a 5.6% charge rate will amount to 20.6 cents/1000 gallons. (See W70-02850). (Carstea-USGS)
W70-02849

STUDY OF 250-MGD MULTISTAGE FLASH DISTILLATION PLANT WITH TWO-LEVEL BRINE FLOW: PART 2. PRELIMINARY ENGINEERING ANALYSIS AND CAPITAL COST ESTIMATE.
Bechtel Corp., San Francisco, Calif.

Rep avail for sale by Superintendent of Documents, US Government Printing Office, Wash, DC, 20402 - Price $3.50. Office of Saline Water Research and Development Progress Rep No 389, Mar 1969. 176 p, 26 fig, 2 tab, 4 ref, 3 append. Oak Ridge Nat Lab-OSW Agreement No 14-01-0001-534 ORNL-Bechtel Corp Subcontract No 3084.

Descriptors: *Capital costs, *Desalination plants, Brines, Flow, Distillation, Cost analysis, Evaporators, Economics, Design criteria, Design flow.
Identifiers: *Multistage flash distillation plants.

A preliminary engineering review was made and a capital cost estimate was made of a 250-mgd multistage flash evaporator desalting plant. The following work was performed: (1) structural, mechanical, instrumentation and electrical engineering review of the plant design provided by the Oak Ridge National Laboratory; (2) a preliminary estimate of capital cost for the plant. A 250-mgd plant could be designed and built in southern California for $149,725,000. The costs of spare parts and replacements were not included in this estimate. (See W70-02849). (Carstea-USGS)
W70-02850

LIMITING CURRENTS IN ELECTRODIALYSIS MEMBRANE CELLS,
N. W. Rosenburg, and C. E. Tirrell.
Water Research Foundation of Australia Report No 29, Papers from Symposium on Aspects of Saline Water held at Adelaide, Feb 20-21, 1969, p 4.1-4.11, Sept 1969. 11 p, 6 fig, 3 tab, 15 ref.

Descriptors: *Electrodialysis, *Membrane processes, *Desalination processes, Electrochemistry, Chemical properties, Water purification, Saline water, Electrolytes, Ion transport, Currents (Water), Turbulent flow, Efficiencies.
Identifiers: Electrodialysis cell design.

High density currents passed through cells containing ion-transfer membranes are limited by concentration gradients occurring at membrane-solution interfaces. In unstirred solutions, high electrical resistance pH changes, and low current efficiencies occur if ratios of current density to solution concentration in meq per cc are above 50 ma per sq cm. By using high velocity solution flow past membrane faces, this limiting current ratio can be increased to above 500. High linear velocities, thin cell spacing, and in the streamline flow region, closely spaced eddy-promoting obstructions are desirable to maximize permissible current densities. It is concluded that turbulent flow, to be effective, must be obtained by increased velocity instead of increased cell thickness. (Knapp-USGS)
W70-02851

HYDRATE REACTION KINETICS AND ICE CRYSTAL GROWTH RATES: 1. THE GROWTH RATE OF ICE CRYSTALS IN FLOWING SUBCOOLED WATER,
Syracuse Univ., N.Y.
Jacques Poisot.
Report available for sale from Superintendent of Documents, US Government Printing Office, Wash, DC, 20402 - Price $0.70. Office of Saline Water Research and Development Progress Report No 370, p 1-23, Nov 1968. 23 p, 11 fig, 3 tab, 14 ref. OSW Grant No 14-01-0001-1455.

Descriptors: *Growth rates, *Crystal growth, *Desalination processes, *Ice, Freezing, Ice-water interfaces, Melting, Brines, Flow, Heat transfer, Cooling, Fresh water.
Identifiers: *Ice crystal growth, Subcooled water flow.

The formation of ice crystals which are later melted to regenerate pure water is involved in freezing processes for desalting saline waters. Growth rates of single ice crystals in flowing subcooled water and brine are discussed. The design of a new cell made it possible to reduce the time necessary to prepare the run itself. Four water velocities have been studied; namely 1.0, 2.18, 8.0 and 16.0 cm/sec, and the degrees of subcooling varied between 0.05 deg C and 0.70 deg C. The growth equation predicts a zero growth in quiescent water for any degree of cooling. The experimental data show that variation of the flow velocity allows control of the heat transfer away from at least part of the crystal. As a practical application it seems possible to save on cost of refrigeration by increasing the fluid velocity, or to obtain growth as fast as desired. The industrial application is more complex and is briefly described. (See W70-03074). (Carstea-USGS)
W70-03073

HYDRATE REACTION KINETICS AND ICE CRYSTAL GROWTH RATES: 2. THE RATE OF FORMATION OF FREON 31 HYDRATE,
Syracuse Univ., N.Y.
Gilbert M. Roux.
Report available for sale from Superintendent of Documents, US Government Printing Office, Wash, DC, 20402 - Price $0.70. Office of Saline Water Research and Development Progress Report No 370, p 24-71, Nov 1968. 48 p, 10 fig, 17 tab, 22 ref, append. OSW Grant No 14-01-0001-1455.

Descriptors: *Rates, *Hydrates, *Desalination processes, Hydration, Sodium chloride, Sea water, Temperature, Crystallization, Salts.
Identifiers: Methyl-bromide hydrate, Hydration desalination.

The development of the hydrate process for seawater desalination requires the knowledge of the reaction rate of the hydrate used (F-31). The formation rate of F-31 hydrate was studied in aqueous solutions of sodium chloride in a one gallon continuously stirred reactor. The main independent variables studied were the effects of agitation, temperature driving force, salt concentration, and fraction of liquid hydrating agent. Liquid F-31 has been found to hydrate 6 times as fast as does methyl bromide for the same agitation rate (0.07 hp/gal). Above temperature differences greater than 0.3 deg C and for 0.19 hp/gal input to the reactor, the reaction rate varies approximately as the square of the temperature difference. The presence of 5.3 wt.% NaCl causes a decrease in the reacation rate, presumably because of transport of salt away from the crystallization site. The rate was found to be dependent on the relative amount of liquid hydrating agent in the reactor when this amount was less than 3% by volume. (See W70-03073). (Carstea-USGS)
W70-03074

CONCENTRATION OF SEAWATER BY ELECTRODIALYSIS,
Japan Monopoly Corp.
M. Kaho, and T. Watanabe.
Paper presented at 3rd Symposium on Salt sponsored by Northern Ohio Geological Survey, Salt Institute, and Solution Mining Research Council, Cleveland, Ohio, Apr 21-24, 1969. Industrial Water Engineering, Vol 6, No 11, p 30-32, Nov 1969. 3 p, 4 fig.

Descriptors: *Desalination, *Electrodialysis, *Salts, *Byproducts, *Costs, Membrane processes, Separation techniques, Electrochemistry.
Identifiers: Salt production (Electrodialysis).

The sea is the sole raw material for salt production in Japan, and 120,000 tons or 13% of the total annual production of salt is now obtained by electrodialysis. The cost of salt production can be reduced by increasing the operating current density, improving the membrane permselectivity to univalent ions, the utilization of by-products, and a combination of a dual purpose plant (power generation and desalination) and salt production with ion-exchange membranes. The dual purpose plant will make it possible to obtain concentrated seawater which in turn will make operation at higher current densities than at present feasible. (Knapp-USGS)
W70-03079

3B. Water Yield Improvement

PRECIPITATION AFFECTS INCREASES IN STREAMFLOW AFTER CONVERTING BRUSH TO GRASS IN ARIZONA,
Agricultural Research Service, Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
Alden R. Hibbert.
Paper presented at 50th Annual Meeting of American Geophysical Union, Wash, DC, Apr 21-25, 1969. 22 p, 5 fig, 2 tab, 7 ref.

Descriptors: *Water yield improvement, *Clear-cutting, *Watershed management, *Rainfall-runoff relationships, *Arizona, Precipitation (Atmospheric), Streamflow, Brush, Grasslands, Seasonal, Rainfall, Winter, Summer, Water yield, Demonstration watersheds.
Identifiers: Chaparral removal.

Water yield has increased substantially on two small chaparral watersheds in central Arizona following control of brush and conversion to grass. The increases in streamflow on the treated watersheds have varied from 1.5 to 14.0 inches per year during the past 7 years. Winter precipitation appears to be the dominant factor controlling the amount of increase. Summer rainfall normally accounts for about one-third of the annual precipitation, but generally has little effect on streamflow. When annual precipitation is less than 16 inches, the increase in water yield for that year is likely to be less than 2 inches. However, the efficiency of the conversion for producing extra water improves as rainfall increases, at least up to 34 inches. At 34 inches of annual precipitation, the increase in flow may reach 12 inches or more, depending on seasonal distribution of the rainfall. (Carstea-USGS)
W70-02882

THE CHANGING ROLE OF WATER IN ARID LANDS,
Gilbert F. White.
Tucson, Arizona, The University of Arizona Press, 1962. 15 p.

Descriptors: *Arid lands, *Water management, Recreation, Water allocation, Industrial water, Urbanization, Population, Pricing, Irrigation, Water supply, Forecasting.
Identifiers: Trends, Santa Cruz Valley, Colorado basin, Social aims, Public attitudes, Nomadism, Recreational use.

A few trends may be noted from the spotty experience of the arid one-third of the earth's land

surface. The current vogue of projecting our resource future by extrapolating past trends in the use and supply of natural wealth has heuristic value in trying to ascertain the future but it carries the danger of these trends being accepted as possible guides for that growth. Sometimes they obscure realization that a present view of resources in itself shapes future use of those resources. As such, the author is provided with an excuse for reviewing familiar experience with water management. Today's vision of the role of water in the Santa Cruz Valley, in the Colorado basin, and in the arid zone as a whole, seems likely to affect the complex of individual decisions determining how remaining waters of those areas will be allocated or reallocated for human use in the decades ahead. According to the framework of public attitudes in which both familiar and unfamiliar hydrologic facts are arranged, water may be cast in roles which will either inhibit or advance social aims. These public attitudes may be expected to reflect in some measure the sweeping changes in social progress and its forces and in turn determine the water allocation decisions of the future. EFFECTS OF CULTIVATION AND GRASS ON SURFACE RUNOFF,
Agricultural Research Service, Coshocton, Ohio. Corn Belt Branch.
Frank J. Dragoun.
Paper No H-28, presented at 50th Annual Meeting of American Geophysical Union, Wash, DC, Apr 21-25, 1969. 13 p, 3 fig, 3 tab, 7 ref.

Descriptors: *Rainfall-runoff relationships, *Cultivation, *Surface runoff, *Water yield improvement, Grasslands, Crops, Land use, Watersheds (Basins), Runoff, Nebraska, Great Plains, Watershed management.
Identifiers: Hastings (Neb).

More than a million acres of marginal cropland have been converted to permanent vegetation in the Great Plains, and conversion is proposed for many more acres. This report presents results of research showing the effect of drastic changes in land use on watershed surface runoff from 4-acre watersheds near Hastings, Nebraska. Surface runoff was significantly reduced two years after converting marginal cultivated fields to perennial grass, and was representative of runoff from native meadow after the third year. Conversely, runoff increased greatly the first year after native meadow was placed in cultivation. (Carstea-USGS)

WATER-RESOURCES APPRAISAL OF CLAYTON VALLEY-STONEWALL FLAT AREA, NEVADA AND CALIFORNIA,
Nevada State Dept. of Conservation and Natural Resources, Carson City.
F. Eugene Rush.
Nevada Department of Conservation and Natural Resources, Water Resources-Reconnaissance Series, Report 45, 1968. 54 p, 6 tab, 1 map, 3 fig, 34 ref.

Descriptors: *Nevada, *Arid lands, *Groundwater, *Water yield, *Water resources, California, Evapotranspiration, Groundwater basins, Valleys, Groundwater movement, Subsurface flow, Water quality, Saline water, Alkaline water, Mineral industry, Spring waters, Hydrologic aspects, Geology, Geologic formations, Phreatophytes, Hydrologic data, Surveys.

This report is a water resource reconnaissance appraisal of the Clayton Valley-Stonewall Flat area which extends from just south of Tonapah, Nevada, to the north end of Death Valley, California. Hydrologic characteristics of the 6 valleys of the study area are summarized. Evapotranspiration accounts for most of the natural discharge from the Clayton Valley while subsurface flow accounts for most of the loss from the remaining valleys. The only important perennial yield is an estimated 22,000 acre feet per year from the Clayton Valley of which only 2,000 is developed at present. The general geological structure and physiography of the area are discussed. The average growing season ranges from about 120 to 200 days depending upon elevation. General intervalley groundwater flow is from north to south with the southernmost units discharging into Death Valley. The area is located in a rain shadow, with average precipitation in the valleys of from 3 to 6 inches. Some mountain areas receive as much as 15 inches. Surface water flow is minimal. The groundwater quality ranges from fair to poor for agriculture and is marginal for domestic use. (Crouse-Arizona)

3C. Use of Water of Impaired Quality

SALINITY TOLERANCES OF CERTAIN TROPICAL SOILS AND RELATIONSHIPS BETWEEN SODIUM ION ACTIVITIES AND SOIL PHYSICAL PROPERTIES,
Hawaii Univ., Honolulu.
S. A. El-Swaify, L. D. Swindale, and G. Uehara.
Report available for sale from Superintendent of Documents, US Government Printing Office, Wash, DC, 20402 - Price $0.55. Office Saline Water Research and Development Progress Report No 419, Mar 1969. 49 p, 15 fig, 14 tab, 74 ref. OSW Grant No 14-01-0001-673.

Descriptors: *Tropical regions, *Soils, *Soil physical properties, *Soil chemical properties, *Hawaii, Calcium, Magnesium, Sodium, Soil water, Irrigation water, Hydraulic conductivity.
Identifiers: *Tropical soils, Soil salinity tolerances, Peptization.

Two tropical soils from Hawaii were tested for salinity tolerances, the ability of the soils to resist physical deterioration by saline waters. Hydraulic conductivity measurements showed that presently permissible limits of salinity and sodium in irrigation water can be safely raised because significant hazardous physical conditions are not likely to occur. Both soils possess high resistance to detrimental peptization even when exposed to extreme sodic conditions. The original acidities of soils are highly resistant to change under leaching. Neither soil had a tendency to accumulate soluble salts by extraction from percolating saline waters. The direct determination of ionic activities for sodium, calcium and magnesium ions as a new and more fundamental tool in soil salinity work is discussed. (Carstea-USGS)
W70-02848

UTILISATION OF SALINE WATER: THE ROLE OF DESALINATION,
Australian Mineral Development Labs., Adelaide.
N. V. Blesing, R. E. Wilmshurst, and J. D.
Melbourne.
Water Research Foundation of Australia Report No 29, Papers from Symposium on Aspects of Saline Water, held at Adelaide, Feb 20-21, 1969, p 3.1-3.9, Sept 1969. 9 p, 3 tab, 3 ref.

Descriptors: *Desalination, *Desalination processes, *Costs, Water quality, Water utilization, Water chemistry, Water demand, Saline water, Groundwater, Surface waters, Water supply Economics.
Identifiers: *Australia.

If sea-water is excluded, the role of desalination in permitting increased utilization can be shown to fall into one of two major categories, depending on the end use of the water. In one broad category are municipal uses - including domestic, industrial and agricultural, while the other includes pastoral applications. The water quality required for each of these uses is reasonably well defined, and the appropriate standards are presented and discussed. The processes available for achieving these qualities are reviewed and technical problems outlined. Comparative cost data are presented. A number of problems, not widely recognized, are defined, and approaches are suggested which may lead to wider recognition of the value of saline water. (Knapp-USGS)

SOME EXPERIENCE IN LEACHING OF SALINE SOILS IN SOUTH KAZAKHSTAN (RUSSIAN),
Ya. D. Kalinin.
Gidrotekhnika i Melioratsiya, No 8, p 66-75, Aug 1969. 2 fig, 8 tab, 7 ref.

Descriptors: *Saline soils, *Leaching, Climates, Seasonal, Crops, Cotton, Humidity, Irrigation engineering, Soil chemistry, Clays, Water demand, Plants, Geology, Groundwater, Water loss, Evaporation.
Identifiers: *USSR, Kazakhstan.

Methods for analysis of ground salt contents and leaching as deep as 40 meters are described on the basis of their application to a 2000-acre area in the saline area of Kazakhstan. The use of 3,500 to 7,500 cum of leaching water per acre on ground containing 0.75 to 1.75% salt gives the best results. Formulas are available to calculate the necessary water volumes for achieving efficient leaching in soils of various chemical compositions. (Gabriel-USGS)
W70-03124

INTRASOIL UTILIZATION OF SEWAGE WATER SEDIMENTS (RUSSIAN),
Institute of Medical Parasitology and Tropical Medicine (USSR).
N. A. Romanenko.
Gidrotekhnika i Melioratsiya, No 8, p 92-95, Aug 1969. 1 tab, 10 ref.

Descriptors: *Sewage disposal, *Sewage treatment, *Soil formation, *Soils, *Soil treatment, Pollutants, Agricultural engineering, Biological communities, Biology, Sampling.
Identifiers: *USSR, Sewage water sediments.

A method of introducing sewage water sediments into the soil and the results obtained are discussed on the basis of the data obtained at an experimental station in the Moscow region. Use of relatively shallow furrows for the introduction of sewage-water sediments into the soil leads to a higher productivity of several crops, such as potatoes, beets, etc. (Gabriel-USGS)
W70-03125

A STUDY OF THE TECHNICAL AND ECONOMIC FEASIBILITY OF USING SEWAGE EFFLUENT FOR IRRIGATION IN LINCOLN PARISH, LOUISIANA,
Louisiana Polytechnic Inst., Ruston. Dept. of Agricultural Engineering.
Charles W. Wilson, and Robert P. Centrell.
Available from the Clearinghouse as PB-189 085, $3.00 in paper copy, $0.65 in microfiche. Paper presented at American Society of Agricultural Engineers, Southwest Region, Baton Rouge, Louisiana, Apr 3-5, 1968. 34 p, 4 tab, 34 ref, 6 fig. OWRR Proj No A-009-LA.

Descriptors: *Irrigation practices, *Effluents, *Sewage disposal, *Waste water (Pollution), Legal aspects, Public health, Economic feasibility, Biochemical oxygen demand.
Identifiers: Lincoln Parish (La).

The sewage effluent used for irrigation acts as a natural fertilizer, and, such use is expected to increase the pollution abatement of streams and rivers. The technical aspects of using sewage effluent for irrigation purposes are: Corrosion potential, plugging effect of sprinkler nozzles, effect of storage reservoirs on effluent quality, effect of salts on soil and crops, effects of effluent on infiltration, effects of effluent on soil organisms, and fluctuating supply and demand for irrigation water. The following public health aspects are discussed: Organisms present in sewage effluent, pollution of soil and groundwater, and pollution abatement of water ways. Some legal aspects are discussed. The economic benefits of irrigation in humid areas depend large on good management practices. An economic analysis was made for each irrigation system in Lincoln Parish, Louisiana. (Grossman-Rutgers)
W70-03159

BRIEF INTRODUCTION TO SOME BASIC KNOWLEDGE ON SALINE SOILS,
Ching-Sheng Ch'en.
Available from the Clearinghouse as AD-692 153, for $3.00 in paper copy, $0.65 in microfiche. Ti Li (Geography), No 1, p 35-40, 1966. Edited translation FTD-HT-23-1109-68.

Descriptors: *Soil salinity, *Soil-water-plant relationships, *Saline soils, *Salts, Irrigation practices, Soil physical properties, Soil chemical properties, Salt tolerance, Irrigation, Drainage, Farm management, Agriculture, Plants, Climatic zones, Rice, Damages, Crop response, Soil classifications, Topography, Hydrogeology.
Identifiers: *China, Ning-hsia region, China.

The types of salts found in saline soils are listed and the effects on soil properties and plants of each salt are discussed. Saline soils are classified by degree of salinity. The types of crops that can be grown in each saline class are discussed. No agricultural crops will grow in soils with salt content of 1 percent or more. Virtually nothing will survive at 3 percent salt content. Types of soil salinity in various regions of China are presented in tabular form. The climatic conditions associated with saline properties in various regions are discussed. The dangers of secondary salinization are presented by region. Finally, the influence of proper irrigation and farming practices can improve or eliminate salinity problems. Application of too much water, rice growing in the wrong soil, or improper drainage can create a salinity problem. (Crouse-Arizona)

3D. Conservation in Domestic and Municipal Use

WATER SUPPLY FOR PORT-AU-PRINCE,
Centrale Autonome Metropolitaine d'Eau Potable (Haiti); MacLaren International Ltd., Toronto (Ontario); and Engineering-Science, Inc., Arcadia, Calif.
E. Limousin, H. Fennerty, and R. G. Ludwig.
Water and Sewage Works, Vol 116, No 7, p 272-275, July 1969. 4 p, 1 fig, 1 photo.

Descriptors: *Water supply, *Water sources, *Water management (Applied), *Municipal water, Water consumption, Water conveyance, Scaling, Water distribution (Applied), Water policy.
Identifiers: Port-au-Prince (Haiti).

Port-au-Prince, Haiti, currently obtains its water supply from springs which issue from the slopes of the Morne l'Hopital mountain ridge. The Morne l'Hopital is a limestone massive of the Oligocene period. Its geologic structure includes faults and fractures and it is along these faults that the springs appear. The yield of these springs has been increased by the construction of sub-surface collection pipe systems in the alluvial material and by tunnels (infiltration galleries) driven horizontally into the slopes of the Morne l'Hopital. The water supply sources serving the Metropolitan area are characterized by their relatively high calcium hardness, alkalinity and carbon dioxide. In addition they are in a state of supersaturation in varying degrees with respect to calcium carbonate. The present criteria for operation of the distribution system is that all consumers receive water for at least one hour per day. The average daily per capita requirement for the study area is estimated at 46 gpd. For fire, an allowance of 500 gpm was adopted for all areas except the main downtown district of the city, where an allowance of 1,000 gpm was adopted. The problem of supersaturation should be amenable to conventional treatment methods. First phase improvements are designed to supply the source and transmission needs through the year 1978. (Knapp-USGS)

ACQUISITION OF WATER RIGHTS BY PUBLIC WATER SUPPLY AGENCY.

Pa Stat Ann tit 32, secs 632-641 (1967).

Descriptors: *Pennsylvania, *Water rights, *Public utilities, *Water supply, Water sources, Eminent domain, Water yield, Water permits, Permits, Water policy, Water, Water management (Applied), Water contracts, Water control, Water utilization, Legislation, Legal aspects, Regulation, Administrative agencies, Appropriation.

Water rights of any public water supply agency which are unused within one year after the effective date of this act are hereby declared null and void. No acquisitions of water rights shall preclude the future acquisition of water rights in the same source unless the water supply shall within one year produce to the Water and Power Resources Board the record upon which such acquisition is founded. It shall be the duty of the Board to consider and pass upon such claims and to keep the Water Acquisitions Record. An actual taking of water for public use shall be construed as prima facie evidence of the validity of the claim, and confirmation by the Board shall constitute a validation of the right. No public water supply agency shall hereafter acquire water except as provided in this act. Any such agency desiring to acquire new water rights shall make application to the Board, which shall make necessary investigations and issue permits or modification orders. The Board may revoke permits for non-use or extend the time for acquiring said water rights. Such agencies shall have the power of eminent domain regarding rights named in the Board's permit. (Smith-Florida)

GENERAL ECONOMIC ASPECTS OF UTILIZATION OF UNDERGROUND WATER FOR IRRIGATION IN HIGH PLAINS OF TEXAS,
Vernon T. Clover.
Department of Economics, Texas Technical College, Lubbock, 1961. 147 p.

Descriptors: *Economics, *Irrigation, Texas, Climate, Geology, Playas, Lakes, Recharge, Conservation, Value, Prices, Income, Taxes.
Identifiers: *Underground water, High Plains, Geography, Economic indicators, Land values.

The purpose of this study was two-fold: (1) to bring together the economically significant facts concerning the use of underground water for irrigation in the High Plains of Texas, and (2) to discover and analyze the general economic implications of these conditions. Chapter 6 of this study provides five indicators of the economic value of underground water. They are: (1) the relationship between land values and the prevalence of irrigation; (2) the relative dependence of farmers upon irrigation as indicated by (a) the percentage of farm land irrigated, and (b) the percentage that irrigated acreage was of harvested acreage; (3) the difference between the market prices of irrigated and dryland farms; (4) the differences between dryland and irrigated farms in regard to yields and the amount of net return to land and management; and (5) the relationship between the percentage of farm land irrigated and the dollar sales per acre. LAND AND WATER DEVELOPMENT IN SOUTHERN FRANCE,
National Co. for the Management of the Lower Rhone and Languedoc Region.
P. Lamour.
In: Comparisons in Resource Management, Baltimore, Johns Hopkins Press, 1961, p 227-250, 34 p, 1 map.

Descriptors: *Agriculture, *Water resources development, *Irrigation, *Economics, Canals, Industries, Economic impact, Water use, Transportation, Navigation, Waterways, Rainfall, Rivers, Flooding, Dams.
Identifiers: *Rhone-Languedoc, *Economic balance, *Power generation, Public utility works.

This article deals with the efforts to improve the use of land and water resources in the Lower Rhone-Languedoc area of Southern France during the past ten years. These efforts are designed to bring a balanced renewal of all economic and social activities to this area and to bring income stability and job opportunities to its inhabitants. The main effort of the development program is an irrigation works system, which was proposed and started in 1957, and which should be concluded around 1980. This irrigation system permits a rapid and spectacular improvement both in agriculture and industry and is drawing many individuals to the area. The development has brought about the disappearance of the 'French desert areas,' and has generated significant economic and social growth in the region. The policies of this program may prove relevant to similar water problems and conditions in the United States. (See Vol. 2, No. 24, Field 6B, entry W69-09952). (Murphy-Rutgers)

SUBSURFACE IRRIGATION RESEARCH IN ARKANSAS,
Arkansas Univ., Fayetteville. Dept. of Agricultural Engineering.
John P. Hoskyn, and Billy B. Bryan.
Available from the Clearinghouse as PB-189 081, $3.00 in paper copy, $0.65 in microfiche. Water Resources Research Center Publication No 3, Arkansas University Experiment Station Report Series 179, June 1969. 28 p, 12 fig, 5 tab, 15 ref. OWRR Proj No A-002-ARK.

Descriptors: *Irrigation, *Irrigation systems, *Subsurface irrigation, *Application equipment, Irrigation design, Equipment, Laboratory tests, On-site tests, Pipes.
Identifiers: Plastic pipe, Pipe perforating techniques.

Subsurface irrigation of cotton was studied to determine and evaluate the hydraulic problems in distributing water in small-diameter perforated plastic pipe at low pressures and to develop optimum design criteria. A greenhouse study of a subirrigation system indicated that 2 psi should be considered as a lower-limit pressure when orifices are built into the pipe wall. A placement depth of 12 inches was preferable to 18 inches in terms of the amount of water required. Twelve inches was used as the depth of placement for a field subirrigation system. From the standpoint of seasonal soil moisture levels and from observations of the system in operation, the following conclusions are drawn: (1) a pressure head of 6 feet of water is preferable to 10 feet, (2) 38-inch lateral spacing is preferred over 76-inch spacing, and (3) an orifice spacing of 30 inches is preferable to a spacing of either 12 or 48 inches. Internal plugging of orifices because of poor quality water was evident. A sufficient selection of valves, timers, engine motor controllers, etc., is already commercially available. (Knapp-USGS)

All-Union Research Inst. for Water Engineering and Reclamation, Moscow (USSR).
N. I. Rabinovich.
Gidrotekhnika i Melioratsiya, No 8, p 31-36, Aug 1969. 2 fig, 2 tab, 1 ref.

Descriptors: *Farm management, *Crop production, *Irrigation practices, *Irrigated land, *Mechanical control, *Automation, Sprinkler irrigation, Productivity, Personnel, Statistics, Cost analysis.
Identifiers: *USSR, Irrigation process automation.

A statistical study of the devices and sprinkling systems used for the irrigation of farm lands in the USSR is described. Their technical and economic characteristics are discussed and a detailed table shows costs associated with introduction and construction of automated sprinkling systems, on the basis of the experience gained during their construction and operation at 5 agricultural sites of the USSR. (Gabriel-USGS)
W70-03122

SPRINKLING IRRIGATION ON LIGHT CHESTNUT SOILS IN THE VOLGOGRAD REGION (RUSSIAN),
G. E. Listopad, and G. I. Chizhikov.
Gidrotekhnika i Melioratsiya, No 8, p 44-46, Aug 1969. 3 fig, 2 tab.

Descriptors: *Sprinkler irrigation, *Chestnut soils, *Application equipment, Crops, Crop response, Parametric hydrology, Runoff, Soil density, Statistics, Evaporation.
Identifiers: *USSR, Volgograd region.

The effects of continuous and discrete sprinkling, sprinkling intensity, and the speed of motion of a sprinkling device on chestnut soils of the Volgograd region were experimentally investigated. In irrigation of the chestnut soils of the Volgograd region, the intensity of continuous sprinkling irrigation should not exceed 0.2 to 0.4 mm/min. In using discrete sprinkling, this rate can be considerably increased (up to 3 times). Higher speed of motion of sprinkling devices leads to higher productivity. (Gabriel-USGS)
W70-03123

COMPUTER SIMULATION PROGRAMMING: AN AID TO THE SELECTION AND MANAGEMENT OF CENTER PIVOT SPRINKLER SYSTEMS,
North Dakota State Univ., Fargo. Dept. of Agricultural Engineering.
E. C. Stegman, and A. Bauer.
Available from the Clearinghouse as PB-189 079, $3.00 in paper copy, $0.65 in microfiche. C.S.A.E. Conference Report, Saskatoon, Saskatchewan, Aug 1969. 31 p, 5 fig, 2 tab, 3 append. OWRR Project B-007-NDAK.

Descriptors: *Simulation analysis, *Sprinkler irrigation, *Management, *Design, *Input-output analysis, Droughts, Planning, Economic feasibility, Crop production, Soils, Water balance.
Identifiers: Center pivot sprinkler.

A computer simulation model was developed for a center pivot sprinkler irrigation system. The objective of the study was to simulate the operating characteristics of the center pivot sprinkler system which would permit the imposition of management scheme variations and offer improved methods of analyzing the suitability of designs for specific applications. The simulation program included (a) the definition of input variables, (b) water balance computations (c) 'when' to irrigate determination (d) 'which' field to irrigate determination, (e) drought day, stress period and yield potential evaluations, (f) yearly summary computation and (g) long record summary. The simulation program was applied to several selected combinations of soils and crop rotations in North Dakota. The data obtained in the study provided the planner with a base on which to estimate the physical adequacy, operational practicality and economic potential associated with a particular design. (Thiuri-Cornell)

PREDICTION OF FLOW RESISTANCE IN FURROWS FROM SOIL ROUGHNESS,
Colorado Agricultural Experiment Station, Ft. Collins.
D. F. Heermann, R. J. Wenstrom, and N. A. Evans.
American Society of Agricultural Engineers, Transactions, Vol 12, No 4, p 482-485, 489, 1969. 1 tab, 2 fig, 6 ref.

Descriptors: *Furrow irrigation, *Irrigation efficiency, *Flow resistance, *Roughness coefficient, *Agricultural engineering, Irrigation, Infiltration, Energy gradient, On-site investigations, Colorado, Statistical methods, Soil physical properties, Roughness (Hydraulic), Resistance, Equations, Surface irrigation, Data collections, Model studies, Stochastic processes.
Identifiers: *Resistance coefficient, *Water advance rate, *Water recession rate, *Soil roughness.

Efficient surface irrigation is possible only with the proper combination of rates of water advance, and recession and thus, infiltration depth. Resistance to flow in furrows caused by surface roughness has an effect on all 3 factors. Studies of surface-roughness characteristics were carried out near Fort Collins and Grand Junction, Colorado. The field procedures are described in detail. The resistance coefficient is related empirically to the standard deviation of roughness height by an equation developed from laboratory observations. It was found that this relationship can be applied directly to field conditions for the range of discharges studied in rectangular and parabolic channels. In the field the standard deviation of roughness height was estimated with 6 randomly selected one-foot

records. It was found that for short furrow reaches (20 to 40 feet) the energy gradient could differ greatly from bottom slope. Therefore, caution must be used in predicting hydraulic variables with the bottom slope in place of energy gradient. On the other hand, for furrows of 140 feet or more, energy gradient can be replaced with bottom slope without serious errors in prediction. (Crouse-Arizona)

SOIL MOISTURE ON NATIVE GRAZING LANDS IN THE SEMIARID NORTHERN PLAINS OF USA,
Agricultural Research Service; and Montana Agricultural Experiment Station, Bozeman.
Walter R. Houston.
Annals of Arid Zone, Vol 7, No 2, p 230-234, 1968. 5 p, 2 tab, 1 fig, 4 ref.

Descriptors: *Soil moisture, *Semiarid climates, *Moisture stress, *Stocking, *Grazing, Soil properties, Soil compaction, Moisture availability, Livestock, Carrying capacity, Loam, Clays, Silts, Montana, Great Plains, Moisture stress.

The amount and duration of available soil moisture is critical for plants in arid and semiarid lands. A study of soil moisture conditions on 3 soils near Miles City, Montana was conducted. There was one range that had been heavily grazed for over 20 years and one only lightly grazed during that time. There were significant differences in soil moisture associated with intensity of grazing. Soil moisture was measured to 107 cm depth. During the favorable year soil moisture increased at 46 cm. and below in loam soil with heavy stocking, while there was less moisture accumulation with light stocking. Apparently there were more deeply rooted plants under light stocking. In contrast, on silty clay soil moisture accumulation at 76 cm. and below was greatly reduced under heavy grazing, probably due to soil sealing and compaction from livestock trampling. During the drought year the soil became dry under both conditions. Prolonged drought reduced forage production to the same level under both grazing conditions possibly owing to death of some plants in the lightly stocked range. (Crouse-Arizona)
W70-03222

THE DEVELOPMENT OF AN IRRIGATION BUDGET,
Department of Agriculture, Edmonston (Alberta). Water Resources Div.; and Saskatchewan Univ., Saskatoon. Dept. of Agricultural Engineering.
H. A. Kerr, and J. M. Murray.
Canadian Agricultural Engineering, Vol 10, No 1, p 12-16, 1968. 1 tab, 3 fig, 15 ref.

Descriptors: *Irrigation, *Irrigation efficiency, *Soil-water-plant relationships, *Soil moisture, *Moisture availability, Irrigation practices, Agriculture, Plant growth, Nuclear moisture meters, Moisture tension, Root zone, Wilting point, Field capacity, Moisture content, Arid lands, Semiarid climates, Atmometers, Evapotranspiration, Water balance, Estimating, Alfalfa, Bromegrass.
Identifiers: *Canada, *Irrigation budget, Saskatchewan.

In arid and semiarid lands irrigation is used to supplement rainfall so that agricultural crops will not be deprived of water required for proper development. An adequate yet efficient irrigation schedule is not possible without knowledge of water requirements of crops and soil moisture conditions. For 2 years soil moisture levels were measured under irrigated stands of alfalfa and brome grass in Saskatchewan, Canada, with a neutron gauge. Measured soil moisture in the top 4 feet of soil was compared with calculated soil moisture using Bellani plate atmometer readings. Soil moisture as predicted from calculated soil moisture budget closely paralleled measured soil moisture. The calculated moisture budget considered the effects of crop height, soil and plant rooting characteristics on the rate of soil moisture use, as well as the evaporation potential. The budget calculation technique is described and graphs are presented comparing measured and estimated soil moisture. (Crouse-Arizona)
W70-03223

PERFORMANCE OF TILE DRAINS UNDER IRRIGATION IN SOUTHERN ALBERTA,
Department of Agriculture, Lethbridge (Alberta); and Manitoba Univ., Winnipeg. Dept. of Agricultural Engineering.
E. Rapp, and G. E. Laliberte.
Canadian Agricultural Engineering, Vol 10, No 2, p 64-69, 1968. 2 tab, 6 fig, 11 ref.

Descriptors: *Irrigation, *Saline soils, *Saturated soils, *Drainage systems, *Tile drainage, Arid lands, Semiarid climates, Groundwater, Subsurface drainage, Drainage effects, Loam, Sands, Tiles, Irrigation engineering, Water table.
Identifiers: *Canada, Alberta.

In an arid environment where irrigation is necessary to agricultural production, tile drains are often used to prevent water logging and salinity or to reclaim soil that was originally saline. The proportion of water applied that must be handled by the drainage system will vary according to soil, water and climatic conditions. The study was conducted in southern Alberta to provide guide lines for designing irrigation drainage systems for that area. Five tile drain systems were tested in areas of sandy loam and loams over sand for a 12-year period. Two interceptor tile drain systems proved highly effective in removing excess water and salts. The performance of three relief tile drains was highly variable. Since salinity of the effluent from relief drains showed no decrease with time, they were judged doubtful for reclamation purposes although they did effectively remove excess water. If relief drains are to be used, the authors suggest that spacing should be no more than 700 to 800 feet to achieve greater effectiveness. (Crouse-Arizona)

COMMITTEE REPORT. SOIL SCIENCE IN RELATION TO WATER RESOURCES DEVELOPMENT: III. SOIL MOISTURE CONSERVATION.
Soil Science Society of America, Inc., Madison. Water Resources Committee.

Soil Science Society of America, Proceedings, Vol 33, No 3, p 480-482, 1969. 3 ref.

Descriptors: *Soil science, *Evapotranspiration, *Evaporation control, *Agriculture, *Water resources development, Soil moisture, Water loss, Soil surfaces, Stomata, Solutes, Mulching, Great Plains, Arid lands, Semiarid climates, Water conservation, Consumptive use, Water amanagement (Applied), Water utilization.

Though all plants require water for growth, some utilize moisture more efficiently than others. Rarely is more than 2% of the water consumed converted into usable products. An estimated 70% of annual precipitation in the U.S. is consumed in evapotranspiration. If only 10% of this could be conserved through more efficient plant use or soil surface conservation, the additional amount available for urban industrial use would be significant. Movement of water into and through soil is reviewed in this article and possible areas for conservation are indicated. Ideally, agriculture would remove from the soil only that moisture required for satisfactory plant development. Soil scientists are conducting studies such as stomatal control, fogging to reduce atmospheric demand, use of barriers against direct evaporation from the soil surface and use of water of higher solute content. Continued efforts of soil scientists can make more nonagricultural uses compatible with agricultural needs. (Crouse-Arizona)

RANGELAND DEVELOPMENT IN KENYA,
Ministry of Agriculture and Animal Husbandry, Nairobi (Kenya). Range Management Div
D. J. Pratt.
Annals of Arid Zone, Vol 7, No 2, p 179-208, 1968. 2 tab, 3 fig, 17 ref.

Descriptors: *Arid lands, *Range management, *Water resources development, *Rural sociology, *Long-term planning, Brush control, Carrying capacity, Grazing, Vegetation regrowth, Soil conservation, Water shortage, Land tenure, Water table, Social adjustment, Social impact, Economics, Economic feasibility, Management, Welfare (Economics), Ecology, Plant ecology, Wildlife, Grasslands, Population, Governments, Programs, Research and development, Tropical regions, Conservation.
Identifiers: *Kenya, *Pastoralism, East Africa.

In arid and semiarid grazing regions of Africa increased population and demand for food has placed tremendous pressure on the land. The indigenous population has attempted to use these dry lands according to traditional methods, thereby creating a major socioeconomic problem. An intricate approach toward this problem is being attempted in Kenya. The objective is to develop planning and management programs based on careful studies of the ecology, sociology, land tenure, and natural resources of the area. Each of these factors is reviewed in some detail with emphasis on the peculiarities of East Africa and Kenya in particular. It is concluded that a key to encouraging the social change necessary to changing subsistence pastoralism into commercial livestock production lies with establishment of secure tenancy to adequate management units. But land title should be given only when there is evidence that adequate water development, animal health, and sound management procedures are being followed. (Crouse-Arizona)

DROUGHT HAZARDS TO SEED GERMINATION,
Nottingham Univ. (England). School of Agriculture.
Walter Heydecker.
Annals of Arid Zone, Vol 6, No 1, p 22-34, Mar 1967. 9 tab, 1 fig, 14 ref.

Descriptors: *Droughts, *Germination, *Soil moisture, *Moisture availability, *Seeds, Drought tolerance, Bulk density, Soil temperature, Soil types, Moisture stress, Field capacity, Planting management, Soil-water-plant relationships, Arid lands, Solutes, Salinity, Osmotic pressure, Plant physiology, Compacted soils, Crop response.
Identifiers: *Water potential, Seedlings.

Germination trials of researchers are reported in a discussion of effects of drought, high soil temperatures and salinity on seed germination. Not all of the studies reviewed were conducted in normally arid lands but the conditions are common to arid lands. The degree of drought under which seeds germinated varied substantially by species. Thus, cabbage and corn seeds could germinate under much drier conditions than onions, carrots, or lettuce. In many cases high temperatures such as are common in arid lands interacted with low soil moisture to further inhibit germination. From data presented it was also apparent that too much soil moisture might also suppress germination. Germination of cabbage and spinach, for example, was much higher at soil water potential of -1.0 atmospheres than under drier conditions or at field capacity. Germination was also better in loamy media with good moisture conductivity than in

media of lower bulk density with resulting poor moisture conductivity. This suggests desirability of compression of low bulk density soils to make more moisture available to germinating seeds. Crusting, however, should be avoided since this can mechanically interfere with successful emergence after germination has taken place. Osmotic potentials of salt solutions in the soil water can also impede germination of seeds in a manner similar to actual moisture stress. Finally, even if the seed does germinate there must be sufficient soil moisture to permit successful development of a root system if the seedling is to grow further. In general the information reported can be useful in developing successful irrigation practices in arid lands. (Crouse-Arizona)

LAND RECLAMATION AND IRRIGATION IN SOVIET AGRICULTURE: AZERBAIDZHAN LEADER REVIEWS LAND RECLAMATION,
V. Yu. Akhundov.
Translated from Bakinskiy rabochiy, Nov 19, 1968. p 3. Land Reclamation and Irrigation in Soviet Agriculture, Joint Publications Research Service, JPRS 47380, p 17-23, 1969.

Descriptors: *Land reclamation, *Irrigated lands, *Project planning, *Construction, *Coordination, Working conditions, Human resources, Salinity, Alkalinity, Gypsum, Arid lands, Soil conservation, Erosion control, Water quality, Water resources development.
Identifiers: *USSR, *Azerbaidzhan.

In 1965 some 162,000 of 1,278,000 hectares of irrigated land were not in production. Since then 11,100 hectares of new lands have been irrigated, others have improved water supplies and agricultural use of irrigated land is up to 97.1%. Productivity remains unsatisfactory. Salinity and alkalinity have become problems. In 1967 a plan called for applying gypsum to 21,800 hectares. Application was carried out on only 725 hectares. There is poor coordination among the several agencies involved in land reclamation and improvement. There is a shortage of skilled labor and technical personnel. Lack of adequate housing and cultural facilities in the newly developed lands also exists. There must be an improvement in determining and meeting completion dates and in the quality of construction on water control systems if agricultural productivity goals are to be met. There is a need for more careful consideration of economic efficiency in planning and executing irrigation and agricultural development projects. There is also a necessity for better forestry practices in the water source areas to protect them from erosion and decline in water quality. (Crouse-Arizona)

LAND RECLAMATION AND IRRIGATION IN SOVIET AGRICULTURE: TADZHIK PARTY LEADER REVIEWS ROLE OF IRRIGATION,
D. R. Rasulov.
Translated from Kommunist Tadzhikistana, Nov 20, 1968. p 2, 3. Land Reclamation and Irrigation in Soviet Agriculture, Joint Publications Research Service, JPRS 47380, p 7-10, 1969.

Descriptors: *Irrigation projects, *Working conditions, *Project planning, *Coordination, *Water resources development, Drainage systems, Arid lands, Irrigated land, Irrigation, Productivity, Labor supply, Investment, Rural areas, Urbanization, Management, Personnel, Land reclamation.
Identifiers: *USSR, *Tadzhikistan.

In Tadzhikistan, USSR, efforts to bring new arid land into cultivation with irrigation have been sharply reduced in effectiveness because of poor coordination between agencies. For example, some 24,000 hectares provided with irrigation in the Zafarobod area show low productivity because housing and cultural facilities were not provided for a potential labor force. In Yavan only 44% of the funds allocated for housing in 1968 was actually used. Major capital investments have been frozen in unproductive irrigation projects owing to lack of coordination between agencies. In several locations productive irrigated land is being encroached upon by urban sprawl. An estimated 70,000 hectares are nonproductive because of lack of drainage systems. A new agency-the Ministry of Rural Construction-has been organized to provide needed housing, roads and community buildings. However, it is slow in attacking the problem because of substandard quality construction and lack of skilled personnel. Full scale reform and a systematic approach to rural development is necessary. (Crouse-Arizona)
W70-03241

LAND RECLAMATION AND IRRIGATION IN SOVIET AGRICULTURE: TURKMEN PARTY LEADER OUTLINES IRRIGATION PLANS,
B. Ovezov.
Translated from Turkmenskaya iskra, Nov 29, 1968. p 1, 3. Land Reclamation and Irrigation in Soviet Agriculture, Joint Publications Research Service, JPRS 47380, p 11-16, 1969.

Descriptors: *Land reclamation, *Irrigation projects, *Working conditions, *Project planning, *Salinity, Drainage, Rural areas, Irrigation canals, Irrigated land, Land development, Soil conservation, Erosion, Drainage systems, Irrigation practices, Arid lands, Agriculture, Planning, Land forming.
Identifiers: *USSR, *Turkmenistan, Karakum Canal, Land leveling.

During 1966-1967 more than 2 million hectares were newly irrigated and drained throughout Turkmenistan, USSR. Reclamation has become a major part of agricultural activity there. Productivity has greatly increased on the collectives. Technical personnel with higher education increased from 2,100 in 1963 to 3,400 in 1968. Capital construction increased by 67%. In Turkmenistan improved irrigated land increased by 110,000 hectares. Construction of the Karakum Canal has continued until it now irrigates some 210,000 hectares including 140,000 of virgin lands. Drainage systems have been improved with 3,200 km. of collectors built. Some areas are still unproductive due to salinity and erosion. The current five-year plan calls for 90,000 additional hectares of irrigated land, improved irrigation practices on 200,000 hectares and leveling of 300,000 hectares. Current planning for the Karakum Canal scheme calls for a total of 600,000 hectares of irrigated land by 1980. For this plan to be successful, there must be increased construction of housing and other improvements in rural working conditions. (Crouse-Arizona)
W70-03242

LAND RECLAMATION AND IRRIGATION IN SOVIET AGRICULTURE: KIRGIZ PARTY LEADER DISCUSSES IRRIGATION PROBLEMS,
T. V. Usubaliyev.
Translated from Sovetskaya Kirgiziya, Nov 27, 1968. p 2, 3. Land Reclamation and Irrigation in Soviet Agriculture, Joint Publications Research Service, JPRS 47380, p 1-6, 1969.

Descriptors: *Land reclamation, *Irrigated land, *Irrigation operation and maintenance, *Productivity, *Alkalinity, Saturated soils, Salinity, Irrigation efficiency, Irrigation practices, Economic efficiency, Leaching, Water conveyance, Water loss, Water management (Applied), Grazing, Range management, Labor supply, Agriculture, Land forming.
Identifiers: *USSR, *Kirgiz, Land leveling.

Irrigation problems in Kirgiz are discussed. Work on irrigation has been done, but many of the areas with irrigation water supply have low productivity. More than 4 million hectares are in poor condition due to water logging, salinity, alkalinity and stony conditions. Millions of rubles worth of production are lost yearly to saline conditions. The new five-year plan calls for new and improved drainage systems, improvement of existing irrigations systems, and extensive land leveling. Total irrigated land will increase by 19,000 hectares and 61,000 hectares of grazing land will be provided with water. The irrigation water supply to 100,000 hectares will be increased and 28,000 hectares will be leveled. These plans will require improved efficiency in water development organizations and more effective investment planning. One-half of the water supply is lost in transfer through poorly built or maintained irrigation systems. Part of the trouble is caused by poor coordination among agencies and poor working and living conditions for labor. (Crouse-Arizona)

04. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control of Water on the Surface

FLOOD PLAIN INFORMATION, AMERICAN FORK AND DRY CREEK, AMERICAN FORK AND LEHI, UTAH.
Corps of Engineers, Sacramento, Calif.

Prepared for Utah Div of Water Resources and Utah County. Corps Engineers Flood Plain Report, Nov 1969. 29 p, 15 fig, 8 plate, 8 tab.

Descriptors: *Floods, *Flood damage, *Utah, Flood plains, Flood control, Non-structural alternatives, Maximum probable flood.
Identifiers: *American Fork (Utah), Lehi (Utah), Standard project flood, Intermediate regional flood.

Flooding of the American Fork and Dry Creek, Lehi, Utah is described in a report of flood plain problems based on records of rainfall, runoff, and historical and present flood heights. Maps, photographs, profiles, and cross sections indicate the extent of flooding that has occurred and which may be expected to occur in the future. The information is for use in study and planning ways to minimize vulnerability to flood damages by control of flood plain use by zoning and subdivision regulations, the construction of flood protection works, or by combinations of these approaches. THE LAW OF UNDERGROUND WATER; A HALF-CENTURY OF HUBER V MERKEL (NON-STATUTORY RULES),
David L. Uelmen.
Wis L Rev, Vol 1953, No 3, p 491-503, May 1953.

Descriptors: *Reasonable use, *Subsurface waters, *Water law, *Underground streams, Riparian rights, Prior appropriation, Groundwater, Hydrologic cycle, History, Percolating water, Judicial decisions, Water policy, Water resources, Artificial use, Competing uses, Legal aspects, Natural use, Ownership of beds, Administrative decisions, Water allocation, Usufructuary right.

While the law regarding surface water is well settled along the lines of reasonable use and rights of riparian owners, the law of underground waters is not as well defined. Three groups of non-statutory rules exist today. The English common law rule is that percolating water existing in the earth is regarded as a part of the soil in which the person owning the land has a property right. This principle is based upon the maxim, to whomsoever the soil belongs, he owns also the sky and to the depths. Early American decisions followed this rule. In later cases, the reasonable use or American rule was developed. When the absolute water rights of one owner conflict with the absolute water rights of another, the person causing the injury must show a reasonable use in connection with the land from which the water is taken and a lack of malice. The California or correlative rights, rule recognizes situations where both land owners want to use the water reasonably on their land, and the supply is insufficient. Here, apportionment of the water provides a solution. (See W70-02898). (Schram-Florida)

CONSTITUTIONAL LAW--NAVIGABLE WATERS--EXTENSION OF THE FEDERAL PEROGATIVE,
Orton Alan Jones.
W Va L Rev, Vol 63, No 1, p 59-62, Dec 1960. 4 p.

Descriptors: *Navigable waters, *Tributaries, *Federal-state water rights conflicts, *Judicial decisions, Federal government, State governments, Regulation, Eminent domain, Watershed management, Flood control, Hydroelectric power, Admiralty, Water law, Federal jurisdiction, Non-navigable waters.
Identifiers: Commerce power.

United States v Grand River Dam Authority, 80 S Ct 1134 (1960), held that Congress may, under the commerce clause, regulate the water flow of a navigable stream. When it does so, there is no taking of property within the meaning of the Fifth Amendment. Under the commerce power, Congress can treat watersheds on navigable streams and their tributaries, and on non-navigable tributaries of navigable streams, as vital to flood control, and can thereby subject them to federal control. The original rule that federal control of interstate commerce extends to all public navigable lakes and rivers has been expanded by the courts to allow federal control to extend over non-navigable portions of navigable streams, and even over intrastate waterways, if such waterways are part of a continuous interstate system. The instant case permits federal control over not only non-navigable portions of a navigable stream, but also non-navigable tributaries of a navigable stream. The trend is toward a rule that would afford the federal government potential control over all the streams in the country that could be classified as being within the watershed of a navigable waterway. (Barnett-Florida)
W70-02902

NAVIGABILITY AS APPLIED TO LAKES IN LOUISIANA.

La L Rev, Vol 6, No 4, p 698-706, May 1946. 9 p, 28 ref.

Descriptors: *Louisiana, *Lakes, *Riparian rights, *Navigable waters, Judicial decisions, Lake beds, Beds, Dry beds, Beds under water, Lake shores, Riparian land, Ownership of beds, Riparian waters, Riparian water loss, Navigation, Bodies of water, Non-navigable waters, Water policy, Accretion (Legal aspects), Boundaries (Property), State governments.

The scope of the laws of alluvion and dereliction and the rights of riparian owners generally do not extend to lakes. According to public policy, the bed of a navigable lake belongs to the state since ownership of the banks by private individuals would practically preclude navigation. The courts have found Articles 509 and 510 of the Civil Code to be inapplicable to lakes, although the proper classification of waterbodies continues to be a source of litigation. A 1910 act provides that beds of lakes not under private ownership are the property of the state, so riparian claims as to non-navigable lakes are against state owned land. Therefore, riparian owners have no claim to the dry bed of a non-navigable lake, since it is either under direct private ownership or is owned by the state. The definition of navigability is not based on whether the body of water has been navigated in the past, but whether it is in fact available for commerce. The burden of proof is on the party who claims that the body of water is navigable. (Douberley-Florida)
W70-02906

NAVIGABLE WATERS, HARBORS AND NAVIGATION.
Wis Stat Ann secs 30.01-30.06 (1964), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Navigable waters, *Public rights, *Bulkhead line, Legislation, Legal aspects, Resource development, Cities, Transportation, Docks, Piers, Basins, Bulkheads, Beds, Lake Michigan, Administrative agencies, Federal jurisdiction, State jurisdiction, Shores, Regulation, Control, Remedies, United States.
Identifiers: *Harbor facilities, *Dock line, Ferries.

A number of terms are defined, including harbor facility, pier, and wharf. Harbor facility means every facility which is useful in the maintenance or operation of a harbor. Pier means any structure which extends channelward from the shore with water on both sides and which is used to moor or unload watercraft. Wharf means any structure which extends along the shore and which is used to moor or unload watercraft. Whenever there is a violation of the statutes relating to navigable waters or an infringement of public rights therein which the Department of Resource Development believes will not be adequately remedied by imposition of penalty, the Department may order the parties responsible to abate the violation. If the Department's order of abatement is ineffective, the attorney general will institute proceedings for enforcement of the Department's order. A shore line established prior to January 1, 1960 is deemed to be a bulkhead line subsequent to such date; a dock line established prior to such date is deemed to be a pierhead line subsequent to such date. None of the foregoing provisions are applicable to submerged shore lands in Lake Michigan owned by municipalities. The Department may waive the applicability of the foregoing provisions as they relate to navigable waters falling within the concurrent jurisdiction of the United States. (Keith-Florida)
W70-02907

HARBORS AND NAVIGATION.

Wis Stat Ann secs 30.30-30.35 (1964), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Water resources development, *Harbors, *Shore protection, Legislation, Legal aspects, Navigable waters, Cities, Canals, Watercourses (Legal), Navigation, Construction, Maintenance, Administrative agencies, Leases, Comdemnation, Contracts, Regulation, Federal government, Flood control, Dredging, Financing, Riparian land, Riparian rights, Bonding, Railroads.
Identifiers: *Harbor improvement.

Every city having navigable waters within or adjoining its boundaries is authorized to: (1) construct, maintain, and improve harbor facilities; (2) construct and maintain shore protection walls; (3) acquire land by condemnation and make special assessments to carry out the foregoing provisions; (4) cooperate with the federal government in the latter's harbor improvement projects; and (5) lease the wharfing privileges of navigable waters at the ends of streets. The procedural and public policy considerations by which cities are to be guided in carrying out the foregoing powers are set forth. Statutory guidelines are provided for the letting of contracts by cities for the construction, maintenance and improvement of harbor facilities and shore protection walls. Any city operating a public harbor through a board of harbor commissioners may construct, maintain, and operate railway facilities connecting various harbor facilities with one another or with other railroads in the vicinity of the city. Provision is made for the financing of shore protection walls and harbor facilities. (Keith-Florida)
W70-02908

HARBORS AND NAVIGATION.

Wis Stat Ann secs 30.77-30.90 (1964).

Descriptors: *Wisconsin, *Boating regulation, *Local governments, *Legislation, Administrative agencies, Boats, Cities, Permits, Boating, Marinas, Boat-launching ramps, Inspection, Aircraft, Financing, Safety, Navigable waters, Public health, Iced lakes, Lakes, Access routes, Recreation facilities, Water pollution.
Identifiers: *Enforcement, *Commercial boating, *Sea planes.

Except as otherwise provided, no municipality may regulate boats or exclude them from the free use of the waters of the state. However, municipalities may adopt regulations relative to the equipment and use of boats consistent with this chapter. Municipalities bordering on inland lakes may regulate the use of boats on those lakes provided all municipalities bordering such lakes have enacted identical regulations. Municipalities may charge fees for using municipally owned launching facilities and may regulate boats carrying passengers for hire. All local regulations must be published. Municipalities may regulate the operation of sea planes on the surface of waters adjoining such municipalities. The state shall give financial aid to municipalities for local enforcement of this chapter by water safety patrol units. The Conservation Commission may establish the jurisdiction of local enforcement units. Such units shall have the enforcement powers of a sheriff. Penalties are provided for violations of this statute. Municipalities may regulate the operation of boats and vehicles on icebound inland lakes. Such regulation shall not render any municipality liable for accidents on regulated lakes. No public access may interfere

with the use of Lions Lake as a recreational area for the physically handicapped. (Dearing-Florida)
W70-02910

DAMS AND BRIDGES.

Wis Stat Ann secs 31.30-31.35 (1967), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Administrative agencies, *Dams, *Water levels, Mills, Mill dams, Non-navigable waters, Wildlife conservation, Fish passages, Water control, Flow, Rivers, Streams, Lakes, Ponds, Cranberries, Crops, Compensation, Damages, Licenses, Leases, Regulation, Discharge, Trout, Fish management, Conservation, Marshes, Damsites, Dam construction, Natural flow, Obstruction to flow, Regulated flow.
Identifiers: *Penalties (Civil).

With the exception of three specified sites or other sites chosen by the Conservation Commission and the Department of Resource Development, no dams shall be constructed across the Brule River and its tributaries. Such dams are to have adequate fishways for the conservation of trout. Water mills and dams may be erected and maintained on streams non-navigable in fact in accordance with delineated regulations. Municipalities may exercise the same rights upon such streams as upon ones navigable for any purpose. Construction of dams to the injury of any lawfully constructed mill is prohibited. All mills and milldams lawfully constructed on non-navigable streams are subject to regulation by the Department of Resource Development, except that no regulation shall prohibit any owner of flooded land from recovering full compensation for his damages. Licenses are hereby issued to the owners of any milldams. The Department may regulate water levels controlled by such milldams. Persons maintaining dams on navigable streams shall pass at least twenty-five percent of the natural flow at all times. Civil penalties are provided for violations. Dams shall not be operated so as to endanger the water supply to cranberry marshes. (Duss-Florida)
W70-02911

WATER RESERVOIRS - RIVER IMPROVEMENT CORPORATIONS.

Wis Stat Ann secs 182.005, 182.016 (1957).

Descriptors: *Wisconsin, *Reservoirs, *Rivers, *Reservoir sites, Legislation, Legal aspects, Water resources, Flow, Flow control, Streams, Dams, Electric power, Local governments, Cities, Land use, Ponds, Bodies of water, Public benefits, Alteration of flow, Regulation, Regulated flow.

The articles of a corporation organized to maintain a system of water reservoirs to regulate the flow of any river must guarantee to owners of water power located below the reservoir system the right to purchase capital stock of the corporation. Corporations' articles may not be amended to withdraw the guaranty. Corporations, private and municipal, may acquire lands necessary for use for ponds or reservoirs if engaged in river improvement activities or furnishing electric power for public purposes. (Casey-Florida)
W70-02915

MUNICIPAL COOPERATION IN FEDERAL RIVERS, HARBORS OR WATER RESOURCES PROJECTS.
Wis Stat Ann sec 66.45 (1965).

Descriptors: *Wisconsin, *Cities, *Federal government, *Water resources development, Legislation, Federal jurisdiction, Rivers, Harbors, Navigation, Cost allocation, Construction, Maintenance, Navigable waters, Control, State governments, Administrative agencies, Project purposes, Projects.

Any county, town, city, or village may agree to cooperate with an agency of the federal government in the construction, operation, or maintenance of any federally authorized projects related to rivers, harbors, or water resources management. If more than one municipality is affected, they may agree to act jointly and may submit any determinations of cost allocation or division of responsibilities among themselves to an arbitration board. (Casey-Florida)
W70-02916

ENLARGEMENT, CONSOLIDATION, DIVISION AND DISSOLUTION OF DRAINAGE DISTRICT.
Wis Stat Ann secs 88.77-88.83 (Supp 1969).

Descriptors: *Wisconsin, *Drainage districts, *Drainage, *Administrative agencies, Drainage programs, Drainage systems, Cost sharing, Local governments, Water policy, Institutions, Decision making, Management, Drains, Cities, Legislation, Legal aspects, Control.

Owners of lands adjacent to a drainage district may petition for annexation to that district. Rules governing procedure for such annexation are provided. Lands receiving benefits from a district may be annexed. Public hearings may result in the consolidation of districts. A landowner may withdraw from a district only where no material injury to the remainder of the district will result. Rules are provided for such withdrawal for the suspension of district operations and for the dissolution of districts on petition of landowners. All debts incurred by a district must be paid before the dissolution of the district. District drains become common waterways subsequent to dissolution. Control of a district within a city may, on petition, be transferred to the city. Requirements and procedure for transfer of control are provided. Transfer may be initiated by landowners or by the city. Money assessed against land in the district is transferred to the city when control over the district is transferred. (Dye-Florida)
W70-02922

NAVIGATION COMMISSION FOR THE DELAWARE RIVER.
Pa Stat Ann tit 55, secs 1-16 (1964).

Descriptors: *Pennsylvania, *River regulation, *Permits, *Administrative agencies, Legislation, Planning, Navigable rivers, Governments, Administration, Building codes, Construction, Zoning, Legal aspects, Surveys, Delaware River, Rates, Regulation, Bridge construction, Harbors, Docks, Maintenance, Cleaning.
Identifiers: Licenses, Penalties (Civil).

An appointive administrative commission is created and is to be known as the Navigation Commission for the Delaware River. The Commission's powers are to survey the capacity of the Delaware River and its tributaries for commercial purposes, regulate construction, and adopt and promulgate regulations for construction on the River. It is the duty of the President of the Commission to enforce these regulations, and failure to comply with such regulations is a misdemeanor punishable by fine. Upon application to the Commission, a license to construct any bridge or harbor structure is issued subject to a hearing and approval of plans and specifications and subject to further approval of the Water and Power Resources Board. The license is void unless work is begun within six months after issuance. All structures not in compliance with law are a public nuisance. The Commission may place liens upon docks, with notice, for having the docks cleaned when such docks are not properly maintained by the owners. The Commission regulates rates for dockage and makes annual statements of expenses. All decisions of the Commission are appealable to the court of common pleas. (Barnett-Florida)
W70-02924

WIDENING OF STREAMS.

Pa Stat Ann tit 55, secs 261 thru 265 (1964).

Descriptors: *Pennsylvania, *Stream improvement, *Channel improvement, *Ownership of beds, Streambeds, Legislation, Navigable waters, Tides, Highways, Transportation, Width, Depth, Channel morphology, Length, Riparian land, Riparian rights, Navigation, Legal aspects, Cost-benefit ratio, Cost allocation.

The county courts may authorize the widening, deepening, and straightening of all navigable streams affected by ocean tides when both sides of the stream are within Pennsylvania. All laws of the Commonwealth relating to widening and straightening roads and highways are applicable to the widening, deepening, and straightening of these navigable streams. The expenses for the improvements must be borne by the advantaged landowners whose lands border on these streams. When such improvements cause any part of the bed of a stream to be left vacant, title to such bed vests in the adjoining landowner. An application to the court by the owners of two-thirds of the land bordering on a stream is required to make improvements authorized by this statute. All of the owners of land through which the stream passes are directed to make improvements ordered by the courts upon approval of a petition. After the improvements are made, the court is required to confirm and establish the altered stream as a navigable stream and public highway, and to vacate that part of the original stream which may have been rendered useless. (Schram-Florida)
W70-02925

HARBOR OF ERIE.
Pa Stat Ann tit 55, secs 361-363, 368-369, 372-374 (1964).

Descriptors: *Pennsylvania, *Harbors, *Port authorities, *Cities, Leases, Marinas, Dredging, Channel improvement, Bridge construction, Boats, Boating regulations, Docks, Water pollution, Soil contamination, Wildlife conservation, Parks, Forests, State governments, Regulation, Ponds, Lagoons, Encroachment, Public benefits.
Identifiers: *Canal basins.

The State Park and Harbor Commission of Erie has full power to maintain and develop all dedicated lands for the purpose of improving the harbor of Erie. The Commission may: (1) contract for the planning, engineering, dredging, filling, bridging, and erection of docks; (2) grant reasonable leases and concessions for the establishment of a suitable harbor for yachts; (3) control waterways, ponds, lagoons, and the operation of boats, docks, and landings; (4) prevent encroachment on lands, channels, and shores of Presque Isle Peninsula; (5) prevent pollution of land or waters; and (6) enact rules for the protection of wildlife. The state dedicates the Presque Island Peninsula to the use of the public. The Erie city authorities may regulate the manner in which the canal basins may be used by the public. The Department of Forests and Waters shall convey to the city of Erie the canal basins and the water property in the Bay of Presque Isle. The water property conveyed is controlled by the city of Erie for the development of the Port of Erie. (Schram-Florida)
W70-02928

WHARVES AND DOCKS.

Pa Stat Ann tit 53, sec 16831, 16834, 16836-16840, 16843 (1957).

Descriptors: *Pennsylvania, *Docks, *Low water mark, *Port authorities, Legislation, Construction, Erection, Riparian land, Riparian waters, Banks, Administrative agencies, Administrative decisions, Permits, Piers, Coastal structures, Rivers, Delaware River, Harbors, Channels, Boundaries (Property), Riparian rights.
Identifiers: *Wharf lines.

The waters in rivers outside of the low water mark are the property of the Commonwealth. No owner of land inside of said mark shall erect or extend any wharf in the Port of Philadelphia without first obtaining a license from the Board of Wardens of the port. Riparian owners of land dedicated to public use are deemed owners of land inside the low water mark. The breadth of water front appertaining to adjacent landowners is determined by protracting the lines of the land to the established wharf limit except when this would give the owner more, or any other property owner less, than his proportionate share of frontage on the wharf line. The procedure for establishing wharf lines on the Schuylkill River is outlined, and once established, no wharf shall be extended further into the river than such lines. In making surveys and soundings for such lines, the surveyors may enter upon any land adjoining the Schuylkill. The Wardens of the Port of Philadelphia may determine the extent to which wharves may be built into the Schuylkill. Any person desiring to erect or extend a wharf into the tide-way of the Delaware River must apply to the Board of Wardens. A license will be granted if the wharf will not encroach on or injure the channel or harbor. (Schram-Florida)
W70-02930

APPROPRIATION OF STREAMS FOR WATER SUPPLY.

Pa Stat Ann tit 53, sec 2905 (1957).

Descriptors: *Pennsylvania, *Water works, *Water conveyance, *Water supply, Legislation, Streams, Rivers, Easements, Right-of-way, Highways, Railroads, Local governments, Bridges, Farms, Erection, Construction, Appropriation, Cities, Pipelines, Water transfer.

Any city desiring to erect waterworks or improve its water supply may appropriate springs, streams, lands, easements, and rights of way, whether within its territorial limits or not. Any city may also lay pipes across, over, or under any lands, rivers, bridges, highways, and railroads to conduct water obtained outside of its territorial limits. However, no waters or springs shall be used so as to deprive the owner thereof of the free use and enjoyment of them for any domestic or farm purposes. (Schram-Florida)
W70-02931

BRIDGES, VIADUCTS AND CULVERTS.
Pa Stat Ann tit 16, secs 2601, 2630-2631, 2652 (1956).

Descriptors: *Pennsylvania, *Culverts, *Bridges, *Embankments, Dikes, Banks, Legislation, Highways, Local governments, Construction, Bridge construction, Abutments, Piers, Streams, Routing, Railroads, Canals, Engineering structures, Stream improvement, Floods, Transportation.
Identifiers: *Altering course of streams.

The county commissioners of any county may locate, construct, widen, straighten, or extend bridges and viaducts over streams and other topographical impediments to public traffic within the county. This applies equally to culverts, necessary approaches, abutments, embankments, fills, and piers. No county may enter any property or act in derogation of the lawful authority of any political subdivision without its consent. In addition, this act does not apply to any matters covered by provisions of the State Highway Law. Whenever it becomes necessary to widen, alter, or straighten the course of any unnavigable stream, the county may enter upon adajacent land and take, injure, and destroy any land necessary to change the course of such stream. Any county may maintain dykes, banks, and causeways across any unnavigable stream for the purpose of protecting county bridges and public highways from tide floods. In connection with this authority, the county may take, injure, and destroy any necessary property. Changes in an existing stream channel requires the approval of the Department of Forests and Waters. If a required embankment or causeway requires more expense than the adjoining townships can bear, it may be entered on the record as a county improvement. (Schram-Florida)
W70-02934

PREVENTION AND CONTROL OF FLOODS.

Pa Stat Ann tit 16, sec 1947 (1956).

Descriptors: *Pennsylvania, *Flood control, *Flood proofing, *Local governments, Legislation, Reservoirs, Flood protection, Floods, Streams, Rivers, Storm drains, Drainage systems, Detention reservoirs, Financing, Government finance, Administrative agencies, Maintenance, River regulation, Control systems.

For the prevention and control of floods, the board of county commissioners may: (1) borrow, appropriate, and expend money; (2) acquire real property by purchase or dedication; (3) regulate and control rivers, streams, and storm water drainage systems; and (4) make contracts and expenditures for the cleansing, regulation, and improvement of streams, drainage systems, and storage or retaining reservoirs. The commissioners may also make expenditures for investigating and examining the condition of rivers, drainage systems, and reservoirs. The commissioners may enter into arrangements with other public authorities, either federal or state, to further these purposes. In exercising these powers, the county commissioners may issue interest bearing bonds in accordance with the Municipal Borrowing Law. (Schram-Florida)
W70-02939

AUTHORITY TO CONTRACT WITH THE UNITED STATES IN FLOOD CONTROL AND DRAINAGE PROJECTS.
Miss Code Ann sec 8038.3 (1956).

Descriptors: *Mississippi, *Federal government, *Flood control, *Drainage programs, Legislation, Navigation, Navigable waters, Highways, Highway relocation, Drainage, Floods, Federal project policy, Property values, Cost allocation, Water resources development, Navigable rivers, Construction, Construction costs, Contracts.

The State Highway Commission may enter into agreements with the Federal government or any agency thereof for the alteration, relocation, reconstruction, or abandonment of state highways, and the conveyance of all state interest in such property where the property is necessary for the construction of flood control, navigation, or drainage projects approved by the Federal government. These agreements and conveyances shall be made upon payment of a consideration deemed reasonable both by the State Highway Commission and by the agency of Federal government affected. No expenses arising from the creation and maintenance of detours will be paid by the Federal government. (Casey-Florida)

BRIDGE AND PARK COMMISSIONS.
Miss Code Ann secs 5974-01, 5974-02, 5974-04 (Supp 1968).

Descriptors: *Mississippi, *Navigation, *Construction, *Harbors, Legislation, Legal aspects, Navigable waters, Cities, Gulf of Mexico, Administrative agencies, Bridge construction, Parks, Contracts, Eminent domain, Dredging, Channel improvement, Reclamation, Maintenance, Piers, Marinas, Jetties, Leases, Fishing, Financing, Surveys, Investigations, Tunnel construction, Boating, Beds, Sewerage, Recreation facilities, Islands, Federal government, Local governments.
Identifiers: *Harbor facilities, Water systems, Ferries.

The purpose of this act is to encourage and assist the economic and commercial development of navigation, harbor, boating, and related facilities in or near the navigable waters of the state. Cities and counties which meet specified standards have the authority to create bridge and park commissions. these commissions have the general power to sue, contract, and exercise eminent domain. In addition, commissioners are specifically granted power to: (1) acquire island located within specified proximity to the city or county for park, recreational, harbor development, and similar purposes; (2) purchase from the state any submerged lands adjacent to such islands for use as filling, provided no obstruction to navigation will be created thereby; (3) construct, build, maintain, and operate bridges, ferries, causeways, or tunnels to connect islands with the mainland; (4) acquire or construct any type of permanent improvements necessary to make commission property usable as public parks, parkways, boulevards, or as otherwise provided; (5) dredge, deepen and widen any channel in aid of navigation and harbor development; and (6) cooperate, consult, and contract with the federal government in furtherance of the foregoing powers. FROMME V UNITED STATES (COMPENSATION FOR THE TAKING OF A FLOWAGE EASEMENT).

412 F2d 1192-1197 (Ct Cl 1969).

Descriptors: *Texas, *Eminent domain, *Easements, *Flooding, Inland waterways, Condemnation, Flood plains, Levees, Rivers, Tributaries, Water levels, Elevation, Channels, Rainfall, Overflow, Spoil banks, Basins, Bays, Runoff, Drainage, Construction, Land use, Legal aspects, Judicial decisions, United States, Floodwater, Compensation.
Identifiers: *Corps of Engineers, Flowage easements.

Plaintiff sued the United States for compensation for the taking of a flowage easement over plaintiff's land. The Corps of Engineers constructed a channel for the Gulf Intracoastal Waterway. A temporary levee and spoil bank were also constructed, as well as a permanent levee. The permanent levee impeded the runoff of floodwaters of the Guadalupe River from claimant's land. The court of claims dismissed plaintiff's petition, holding that there was no taking of a permanent interest in the land. The interference with runoff due to temporary construction ceased to exist upon completion of the channel. Interference due to permanent construction was not so great as to meet the court-established test for creation of a flowage easement. This test was formulated in United States v Cress, 243 US 316 (1917), and requires intermittent, frequent, and inevitably recurring flooding of the land. (Duss-Florida)

THE FLOOD CONTROL CONTROVERSY, BIG-DAMS, LITTLE DAMS, AND LAND MANAGEMENT,
Luna B. Leopold, and Thomas Maddock, Jr.

New York, The Ronald Press Co, 1954. 278 p.

Descriptors: *Flood control, *Dams, *Land management, Water resources, Costs, Benefits, Administration, Zoning, Water systems, Engineering, Levees, Floodways, Channel improvement, Reservoirs, Planning, Flood protection, Cost-benefit ratio.
Identifiers: River flood plain, Flood insurance, Downstream programs, Upstream programs, Federal interest, Local participation.

The purpose of this book is to investigate the facts regarding flood control, a subject that has given rise to extreme controversy in the United States in recent years. Sections of this study deal with: the flood control problem, administrative elements of a flood control program, engineering measures for flood control, land management, downstream and upstream programs for flood control, the federal interest, and local participation. The book considers questions which recur in many resource fields: the definition of the public interest, the allocation of the costs and benefits of resource development, and the economic and political means for carrying this development forward. The controversy over flood control in the United States illustrates the conflicts of interest and opinion that seem bound to arise over matters of resource development and use in any country. Most of these conflicts are complicated. In the present account one can grasp how difficult it is to achieve balanced resource programs and to apportion their cost equitably. It is inevitable that similar controversies should arise in many fields as the use of land and water resources becomes more intensive and competitive and as the economies of the less developed countries are primed toward greater productivity and integration. FLOOD PLAIN INFORMATION, KERN RIVER, BAKERSFIELD, CALIFORNIA.
Corps of Engineers, Sacramento, Calif.

Corps of Engineers Flood Plain Report, Oct 1969. 39 p, 25 fig, 10 plate, 8 tab.

Descriptors: *Floods, *Flood damage, *Flood plains, Flood control, Non-structural alternatives, California, Maximum probable flood, Historic flood.
Identifiers: Kern River, Bakersfield (Calif), Standard project flood, Intermediate regional flood.

Flooding of the Kern River, Bakersfield, California is described based on records of rainfall, runoff, and historical and present flood heights. Included are photographs, profiles, and cross sections that indicate the extent of past flooding and flooding which may be expected in the future. Bakersfield and Oildale are cities affected. The information is useful for surveys by water resources managers and others in planning ways to minimize vulnerability to flood damages by better control of flood plain use by zoning and subdivision regulations, the construction of flood protection works, or by combinations of these approaches. (Lang-USGS)
W70-03090

HURRICANE CAMILLE TIDAL FLOODS OF AUGUST 1969 ALONG THE GULF COAST, OCEAN SPRINGS-DEER ISLAND QUADRANGLES, MISSISSIPPI,
Geological Survey, Washington, D.C.
K. V. Wilson, and James W. Hudson.
Available from the US Geological Survey, Wash, DC, 20240, for $0.75 per copy. Geol Surv Hydrol Invest Atlas HA-405, 1 sheet, 1969. Test, 2 fig, 1 map, 1 photo, 1 tab, 3 ref.

Descriptors: *Floods, *Mississippi, *Hurricanes, *Flood damage, *Coasts, Tidal effects, Atmospheric pressure, Rain, Surges, Wind velocity, Winds, Disasters, Storms, Waves (Water), Water levels, Water level fluctuations, Inlets (Waterways), Sea level, Shores.
Identifiers: *Hurricane Camille (1969), Ocean Springs (Miss), Deer Island (Miss), Tidal floods, Storm tides.

The areas flooded by hurricane Camille tides of August 18, 1969 along the Mississippi Gulf Coast are shown in a series of hydrologic atlases. The Atlas of the Ocean Springs and Deer Island quadrangles show flooded areas on a topographic map scaled 1:24,000. Camille was the most intense hurricane on record to enter the U.S. mainland. Estimated maximum winds were 190 mph, and the central pressure was 26.61 inches of mercury. The eye of the storm, traveling about due north, passed over the Waveland-Bay St. Louis area and winds of over 75 mph extended about 50 mi on each side. Maximum precipitation was 10 inches. Flooding was most severe in the Pass Christian area where tides reached 25 ft above msl. High tide frequency and annual maximum tide are shown by graphs. (Knapp-USGS)
W70-03097

FLOODS OF APRIL 28, 1966, IN THE NORTHERN PART OF DALLAS, TEXAS,
Geological Survey, Washington, D.C.
Willard B. Mills, and Elmer E. Schroeder.
Geol Survey Water-Supply Paper 1870-B, p B1-B37, 1969. 37 p, 18 fig, 2 plate, 1 tab, 8 ref.

Descriptors: *Floods, *Texas, *Storms, Rainfall, Rainfall intensity, Runoff, Rainfall-runoff relationships, Data collections, Hydrologic data, Streamflow, Stage-discharge relations, Hydrographs, Profiles, Flood damage.
Identifiers: Dallas (Texas).

The floods of April 28, 1966, in the northern part of Dallas, Tex., caused heavy damage to a relatively small area. Flood damage was estimated at $2,500,000; and of this amount, $1,330,000 damage was along Bachman Branch, which has a drainage area of 12.3 square miles. At least 7 persons died as a direct result of the floodwaters. The flood was caused by a 5-hour storm in the early hours of April 28. Antecedent rainfall had so saturated the area that the intense, but relatively low, total rainfall (less than a 50-year return period) caused historical floods to be exceeded at many points. A peak runoff rate of 3,160 cfs per sq mi occurred on a 1.5 sq-mi area within the watershed. (Knapp-USGS)
W70-03098

FLOODS OF JUNE 1965 IN SOUTH PLATTE RIVER BASIN, COLORADO,
Geological Survey, Washington, D.C.
H. F. Matthai.
Geol Surv Water-Supply Paper 1850-B, p B1-B64, 1969. 64 p, 12 fig, 4 plate, 4 tab, 15 ref.

Descriptors: *Floods, *Colorado, *Rainfall-runoff relationships, Streamflow, Stage-discharge relations, Flood plains, Discharge (Water), Hydrologic data, Data collections, Duration curves, Hydrographs, Profiles, Flood damage, Disasters.
Identifiers: South Platte River, Denver (Colo).

Heavy, intense rains in three areas, on June 14-17, 1965 caused outstanding floods on many streams in the South Platte River basin from Plum Creek, just south of Denver, downstream to the Colorado-Nebraska State line. The flood-producing storms followed a relatively wet period, and rainfall of as much as 14 inches in a few hours was reported. Previous record high discharges on many tributaries with drainage areas on the plains were exceeded, sometimes severalfold. The attenuation of the peak flow by channel storage as the flood passed through Denver was considerable; yet the peak discharge of 40,300 cfs of the South Platte River at Denver was 1.8 times the previously recorded high of 22,000 cfs in a period of record starting in 1889. The 1965 peak would have been still higher except that all flow from Cherry Creek was stored inCherry Creek Reservoir. Descriptions of the storms and floods, detailed streamflow records, and information on damages, flood profiles, inundated areas, and flood frequency are included in this report. Several comparisons of the magnitude of the flood are made, and all indicate that an outstanding hydrologic event occurred. (Knapp-USGS)
W70-03100

THE EFFICIENCY OF DOUBLE-SIDED CONTROL DRAINAGE SYSTEMS IN THE UKRAINE (RUSSIAN),
G. G. Afanas'yev.
Gidrotekhnika i Melioratsiya, No 8, p 59-65, Aug 1969. 7 tab, 3 ref.

Descriptors: *Drainage systems, *Efficiencies, *Reclamation, Canals, Soils, Climates, Cost analysis, Economic justification, Dry seasons, Topography, Hydrogeology, Crops, Productivity.
Identifiers: *USSR, Ukraine.

The effect of double-sided control drainage on the productivity and cost of land reclamation was ex-

perimentally investigated. The cost of reclamation in the Kiev region is 150 rubles and 83 rubles per acre using double-sided and one-sided drainage systems, respectively; however the productivity of land under the double-sided drainage control is over 2 times greater than that under the one-sided drainage control. URBAN STORM DRAINAGE CRITERIA MANUAL.
Wright-McLaughlin Engineers, Denver, Colo.

Work performed for the Denver Regional Council of Federal Governments, Denver, Colorado. Wright-McLaughlin Engineers, Vols I and II, Mar 1969. 726 p, 39 tab, 139 fig, 171 ref. HUD Project Colo P-62.

Descriptors: *Drainage engineering, *Design criteria, *Drainage programs, *Drainage practices, *Storm runoff, *Surface drainage, *Storm drains, *Flood control, Rainfall-runoff relationships, Hydrology, Hydraulic structures, Water law, Administration, Watershed management, Flood proofing, Hydraulics, Intakes, Open channels, Storage, Culverts.
Identifiers: *Denver, *Denver Regional Council of Governments, *Storm drainage policy, Major drainage system, Streets for drainage channels, Curb and gutter design.

The manual was written to suggest techniques, methodology and guidelines to facilitate the implementation of a new and more thorough approach to storm drainage problems in Metropolitan Denver. This work appears to be the most comprehensive treatment of urban storm drainage design criteria available. The authors recommend adoption of the manual by government agencies in Metropolitan Denver, and that the Denver Regional Council of Governments provide coordinate drainage activities. Volume 1 includes chapters on suggested drainage policy, Colorado drainage law, drainage planning for initial and major drainage, rainfall data and analyses, rainfall-runoff relationships, storm sewer design criteria and standards, and drainage criteria for the design of streets and storm water inlets. Volume 2 deals with criteria for the design of the 'major' drainage system; i.e., the system which carries the runoff from a storm having a frequency of occurence of once in 100 years. Included are design criteria for open channels, large diameter conduits, box culverts and inlets, energy dissipators, baffle and accelerator chutes, and channel drops. The benefits of temporary storage in reducing peak runoff rates is discussed. Flood proofing techniques, the use of irrigation ditches and benefits of well designed drainage systems are discussed. (See also W70-03149 thru W70-03152). (Poertner-Chicago)
W70-03148

DRAINAGE POLICY, (Chapter 1).
Wright-McLaughlin Engineers, Denver, Colo.

In: Urban Storm Drainage Criteria Manual, Vol 1, Wright-McLaughlin Engineers, Denver, Mar 1969. 54 p. HUD Project Colo P-62.

Descriptors: *Design criteria, *Water policy, *Drainage programs, *Drainage practices, *Drainage engineering, *Storm runoff, *Watershed management, *Flood control, Flood proofing, Design standards, Flood plains, Design storm, Storage, Watershed basins, Surface runoff, Drainage, Surface drainage, Drainage systems, Drainage water, Hydrology, Ponding, Rational formula, Flood plain insurance.
Identifiers: *Denver, *Denver Regional Council of Governments, *Storm drainage policy.

The manual was written to suggest techniques, methodology, and guidelines needed to facilitate the implementation of a new and more thorough approach to storm drainage problems in Metropolitan Denver. The chapter on 'Policy' recommends the adoption of this manual by government agencies. Storm drainage is presented as a 'space-allocation' problem demanding planning and integration on a regional basis. A set of policy statements, based upon underlying principles, technical criteria, and data is recommended to provide direction for planning, providing, and operating drainage facilities. These statements call for the initiation of flood plain management programs and a program for collecting and analyzing stormwater runoff and flood data. Stormwater drainage master plans, based upon the criteria in this manual and consistent with the comprehensive plan, are encouraged for adoption by each urbanized drainage basin. Coordination by the Denver Regional Council of Governments is suggested. The report includes recommendations for participation by governmental units in the National Flood Insurance Act of 1968. Design criteria discussed relate to storm frequency, initial and major drainage system considerations, natural drainageways, water quality control, and runoff computation. Emphasis is placed upon coordinating drainage planning with transportation and open space planning. (See W70-03148). (Poertner-Chicago)
W70-03149

SUMMARY OF COLORADO DRAINAGE, (Chapter 2), AND PLANNING, (Chapter 3).
Wright-McLaughlin Engineers, Denver, Colo.

In: Urban Storm Drainage Criteria Manual, Vol 1, Wright-McLaughlin Engineers, Denver, Mar 1969. 43 p, 6 ref. HUD Project Colo P-62.

Descriptors: *Water law, *Legal aspects, *Legislation, *Natural flow doctrine, *Administration, *Watershed management, *Flood routing, *Water resources planning, *Riparian rights, Water rights, Judicial decisions, Obstructions to flow, Drainage programs, Flood control.
Identifiers: *Denver, *Denver Regional Council of Governments, *Liability for flood damages.

The manual was written to suggest techniques, methodology, and guidelines to facilitate the implementation of a new and more thorough approach to storm drainage problems in Metropolitan Denver. The chapter on 'Law' presents the responsibilities and legal liabilities of municipalities relating to planning, constructing, operating, maintaining and repairing drainage improvements. The importance of obtaining all pertinent facts and developing a plan before initiating a proposed improvement is stressed. Municipalities proceeding in this manner can be relatively assured of no legal complications and should be able to use any of several different means to finance proposed improvements. Specific legal actions are cited and briefed. The chapter on 'Planning' cites drainage systems as being subsystems of the total urban system, affecting orderly growth and development. Planning should include consideration of multiple-uses and additional benefits which can result from well planned drainage systems. Emphasis is placed upon adopting plans which incorporate undisturbed natural swales and waterways. Other aspects discussed include drainage management measures, master planning, flood plain planning, initial and major systems, transportation facilities relationships, open space, and planning and sizing of storm sewer systems. (See W70-03148). (Poertner-Chicago)
W70-03150

RAINFALL FOR THE DENVER REGION, (Chapter 4), AND RUNOFF, (Chapter 5).
Wright-McLaughlin Engineers, Denver, Colo.

In: Urban Storm Drainage Criteria Manual, Vol 1, Wright-McLaughlin Engineers, Denver, Mar 1969. 77 p, 13 tab, 19 fig, 38 ref. HUD Project Colo P-62.

Descriptors: *Rainfall, *Runoff, *Rainfall disposition, *Rainfall intensity, *Hydrology, *Rainfall-runoff relationships, *Storm runoff, *Design criteria, *Drainage engineering, Design storm, Duration curves, Hydrograph analysis, Unit hydrograph, Rational formula, Flood forecasting, Frequency analysis.
Identifiers: *Denver, *Denver Regional Council of Governments.

The manual was written to suggest techniques, methodology and guidelines to facilitate the implementation of a new and more thorough approach to storm drainage problems in Metropolitan Denver. The chapter on 'Rainfall' suggests a rainfall analysis technique similar to that employed by the U.S. Weather Bureau (Technical Papers Nos. 28, 29 and 40). The chapter includes several key rainfall-frequency maps making it possible to determine any combination of return-period from one to 100 years and durations from 5 minutes to 24 hours. Nine isohyetal maps, labeled 'Rainfall depth-Duration-Frequency Map, Denver Region,' are presented. The chapter on 'Runoff' describes in detail the following three methods of calculating runoff applicable to Metropolitan Denver: (1) Rational Method, for sewers draining areas less than 200 acres; (2) Colorado Unit Hydrograph Procedure, for sewers draining basins in excess of 200 acres; and (3) Statistical Analysis, for streams upon which future urbanization will have little effect on runoff inflow. Two statistical methods are illustrated: (1) Log-Pearson Type III, and (2) Index Flood. Flood Plain Information Reports, prepared by the Corps of Engineers for delimiting flood hazard areas and stream surface profiles, are cited. Users are urged to allow for anticipated urbanization. (See W70-03148). (Poertner-Chicago)
W70-03151

STORM SEWERS (Chapter 6); STREETS AND INTERSECTIONS (Chapter 7); AND STORM WATER INLETS (Chapter 8).
Wright-McLaughlin Engineers, Denver, Colo.

In: Urban Storm Drainage Criteria Manual, Vol 1, Wright-McLaughlin Engineers, Denver, Mar 1969. 252 p, 18 tab, 60 fig, 36 ref. HUD Project Colo P-62.

Descriptors: *Storm drains, *Drainage systems, *Design criteria, *Hydraulic design, *Intakes, Design standards, Surface drainage.
Identifiers: *Street drainage, *Street design criteria, *Stormwater inlets, Curb and gutter design, Streets for drainage channels.

The manual was written to suggest techniques, methodology and guidelines to facilitate the imple-

mentation of a new and more thorough approach to storm drainage problems in Metropolitan Denver. The chapter on 'Storm Sewers' presents criteria intended for use by engineers in designing systems of storm sewers for collecting and conveying stormwater runoff to points of discharge in the major drainage system. Design procedures and criteria are recommended for all elements of a typical storm sewer system, including conduits, channels, inlets, bends, junctions, manholes, outlets, pressure systems, and the related hydrologic aspects of rainfall and runoff. The chapter on 'Streets' presents criteria and suggested procedures and standards for street design. Drainage design of streets is approached from the standpoint of providing systems to drain streets and, secondarily, using streets as integral parts of local drainage systems. The chapter on 'Storm Inlets' discusses the various types of inlets devices used for providing openings to drain stormwater from streets into sewers. Design criteria and inlet capacity graphs are treated in detail. Several examples of typical designs of storm sewers, streets, and stormwater inlets are presented. (See W70-03148). (Poertner-Chicago)

Plaintiff alleged that defendant negligently constructed a dike in a creek flowing along the north side of both plaintiff's and defendant's land thereby obstructing the creek's natural flow, which caused an overflow onto plaintiff's land. Plaintiff asked for temporary and permanent damages. The court held that while a cause of action was stated, plaintiff was not entitled to damages for a permanent injury. Surface water is a common enemy which may be warded onto the land of an adjacent or lower owner. However, it may not be unneccessarily collected and discharged to the lower owner's damage. The upper owner may not discharge water in a different manner than it would usually have gone in the natural course of drainage, nor may a natural stream be dammed and the waters diverted to the damage of property without compensation therefor. However, the injury here did not occur until three years after construction of the dike, and a continued injury would depend upon weather conditions. (Smith-Florida)

SWAMP LAND GRANTS AND THE CONSERVATION FUND.
Wis Stat Ann secs 25.235, 25.29 (1964), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Financing, *Reforestation, *Conservation, Legislation, Legal aspects, Swamps, Overflow, United States, Arkansas, Permits, Administrative agencies, Fishing, Leases, Marshes, Schools (Education), Economics, Expenditures, Government finance, Income, Taxes, Land development, Land management.

The Congress of the United States passed an act to enable the state of Arkansas and other states to reclaim the swamp lands within their limits in 1850. All swamp and overflowed lands received by virtue of said act are declared trust lands. All income derived from trust lands will be applied exclusively to the school fund. All moneys accruing to the state for or in behalf of the State Conservation Commission, except fines and moneys payable to the Reforestation Fund, will constitute the Conservation Fund. No money will be expended from the Conservation Fund except in pursuance of an appropriation by law. Funds accruing to the Conservation Fund from the issuance of hunting and fishing permits will not be diverted for any purposes other than those delineated by the Conservation Commission. A set portion of each permit fee will be used toward acquisition and leasing of public hunting and fishing grounds. Specified moneys received into the Conservation Fund must be expended for forest development and reforestation. (Keith-Florida)

PREVENTION AND CONTROL OF FLOODS.
Pa Stat Ann tit 16, sec 5147 (1956).

Descriptors: *Pennsylvania, *Flood control, *Channel improvement, *Local governments, Control, Water control, Abatement, Drainage systems, Flood protection, Floodways, Multiple-purpose projects, Flood routing, Rivers, Streams, Storm drains, Drains, Storm runoff, River basin development, Flow control, Flood forecasting, Flooding, Costs, Economics, Cost sharing, Budgeting.

For the purpose of cleansing, regulating, improving and controlling rivers, streams, and storm drainage systems for the prevention and control of floods, the board of county commissioners may borrow, appropriate and expend money and may acquire real property or any interest therein. The commission may make expenditures to investigate and examine such waters and may seek contribution from the United States or any other state. (Smith-Florida)
W70-03187

FLOOD CONTROL PROJECTS.
Pa Stat Ann tit 32, secs 666-672 (1967), as amended, (Supp 1969).

Descriptors: *Pennsylvania, *Flood control, *Highways, *Reservoirs, Abatement, Check structures, Drainage systems, Flood damage, Flood protection, Flood routing, Control structures, Diversion structures, Flooding, Cities, Local governments, State governments, Federal government, Water resources development, Interstate, Riparian rights, Financing, Easements.

Municipalities and the Department of Highways may agree with the Water and Power Resources Board or federal agencies to relocate roads, streets, bridges, or viaducts to aid any state or federal flood control works. Any state highway becoming flooded, unnecessary, or dangerous because of a flood control reservoir may, with the Governor's approval, be closed by the Secretary of Highways. The Secretary and municipalities may grant easements or flowage rights to the United States to submerge highways, streets, roads and bridges during emergency floods. The Board may accept and operate completed federal flood control works. The rights to waters in a flood control district are limited to those rights in existence before such district was created. Any increase in possible use of these waters is owned by the state. Special financing is provided for, and a flood control fund is created. The Water and Power Resources Board is empowered to cooperate with other states in flood control projects and may delegate certain powers to the federal government. (Smith-Florida)
W70-03192

NAVIGABLE WATERS AND NAVIGATION IN GENERAL.
Wis Stat Ann secs 30.10, 30.11 (1964), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Navigable waters, *Navigation, *Bulkhead line, Legislation, Legal aspects, Lakes, Streams, Bayous, Harbors, Basins, Canals, Dams, Bridges, Cities, Regulation, Boundaries (Property), Leases, Beds, Riparian rights, Administrative agencies, Resource development, Bridge construction, Construction, Standards.
Identifiers: *Public waters, *Obstructions to navigation, *Riparian owners.

All lakes within the state which are navigable in fact are declared to be navigable and public waters. All steams, sloughs, bayous, and marsh outlets which are navigable in fact are declared navigable to the extent that no dam, bridge, or other obstruction shall be constructed in or over them without the permission of the state. All inner harbors, turning basins, waterways, slips, and canals created by any city for purposes of public navigation and all outer harbors connecting interior navigation with lake navigation are declared navigable waters. The power of cities to construct bridges over streams is not impaired. Boundaries of riparian land and

rights of riparian owners will be determined in conformity with the common law, with specified exceptions. Cities may, subject to the approval of the Department of Resource Development, establish a bulkhead line and change it from time to time. The standards and methods for establishing bulkhead lines are specified. Establishment of a bulkhead line will not abridge the riparian rights of riparian owners. The requisites for leasing by the Department of Public Lands for specified purposes are set forth. (Keith-Florida)
W70-03195

DIVERSION AND ALTERATION OF WATERCOURSES.

Wis Stat Ann secs 30.18, 30.19, 30.195 (1964), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Diversion, *Artificial watercourses, *Water resources development, Legislation, Legal aspects, Streams, Lakes, Water levels, Riparian land, Riparian rights, Public rights, Surplus water, Permits, Structures, Maps, Surveys, Planning, Channels, Canals, Condemnation, High water mark, Banks, Navigation, Highways, Wildlife conservation, Administrative agencies.
Identifiers: Penalties (Criminal).

The surplus water of any stream may be temporarily diverted in order to restore or maintain the normal water level of any navigable lake or stream. Water, other than surplus water, may be diverted with the consent of riparian owners to be damaged thereby if such diversion is for agricultural purposes and will not be detrimental to public rights. Surplus water means any water of a stream which is not being beneficially used. Before any water may be diverted, a permit must be obtained from the Department of Resource Development. The method for applying for such permits and the conditions on which such permits are granted are set forth. It is unlawful to begin any work designed to connect any watercourse or body of water with any existing navigable watercourse or body of water without first obtaining a permit from the Department of Resource Development. The method of application, requirement for public hearing and conditons under which such permits may be granted are set forth. Criminal penalties are provided for violation of any of the foregoing provisions. It is unlawful to change the course of a navigable stream without first having obtained a permit therefor from the Department pursuant to statute. (Keith-Florida)

CONSTRUCTION AND MAINTENANCE OF DAMS.

Wis Stat Ann secs 31.04-31.09 (1964), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Administrative agencies, *Dams, *Water control, Cities, Navigable waters, Permits, Damsites, Eminent domain, Construction, Piers, Hydraulics, Recreation, Benefits, Economic justification, Conservation, Public rights, Lakes, Lake shores, Aesthetics, Rivers, Water levels, Height, Property values, Legislation, Electric power production, Operation and maintenance.

Permits to construct, operate, and maintain dams may be granted to persons, corporations, or municipalities pursuant to this law. Written applications for permits contain a general description of the proposed dam, the proposed site, the intended purpose of the dam, and an estimate of the dam's capabilities of producing hydraulic power. The Department of Resource Development shall hold public hearings on applications for permits. The Department shall consider public interest, economic effects, and recreational values when reviewing each application. Scenic beauty has a high priority in this consideration. The Department shall also investigate the potentialities of any lakes and lake shores which would be created by the flowage of proposed dams. The Department shall also weigh the effects of dams upon rivers. If the economic need for electric power is less than the value of recreation and scenic beauty, the Department must deny the permit. Provision is also made for applications for permits to operate existing dams. Procedures for approving such applications are substantially the same as those governing the construction of new dams. (Duss-Florida)
W70-03200

MAINTENANCE OF DAMS AND DIKES FOR DRAINAGE CONTROL AND CONSERVATION.
Wis Stat Ann secs 31.36-31.38 (1967), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Administrative agencies, *Water conservation, *Drainage, Water control, Ditches, Flow, Rivers, Streams, Lakes, Dams, Dikes, Levees, Breakwaters, Shores, Banks, Right-of-way, Condemnation, Cost sharing, Conservation, Wildlife conservation, Furbearers, Aquatic animals, Birds, Breeding, Construction, Irrigation, Cost allocation, Decision making, Project planning, Cost analysis.
Identifiers: *Pisciculture.

The Water Regulatory Board is created to supervise the operation, repair, and maintenance of dams and dikes constructed across drainage ditches and streams within drainage districts, in the interest of drainage control, water conservation irrigation, and pisciculture. The Board is directed to provide areas suitable for the nesting and breeding of aquatic birds and the propagation of fur-bearing animals. The Board shall operate in cooperation with the various drainage districts throughout the state. Municipalities are directed to furnish the right-of-way for additional levees. Municipalities may authorize the acquisition, construction, maintenance, or repair of dams across any lakes or streams adjoining, or within, the limits of that municipality. After cost estimates of these projects are adopted by the municipality, project plans must be submitted to the Department of Resource Development or to the proper United States officer for approval. The method of cost assessment for improvements is set forth. (Duss-Florida)

CONSTRUCTION, MAINTENANCE AND IMPROVEMENT OF DRAINS.

Wis Stat Ann secs 88.62-88.73 (Supp 1969).

Descriptors: *Wisconsin, *Drainage, *Drainage districts, *Maintenance, Maintenance costs, Construction costs, Administrative agencies, Drainage programs, Drainage systems, Budgeting, Cost sharing, Local governments, Water policy, Inspection, Contracts, Assessments, Drains, Legislation, Bridge construction.

A drainage board must maintain the drains of its drainage district and inspect them annually. When funds for maintenance of drains fall below five percent of the benefits of drainage, the boards shall levy assessments for the costs of maintenance and repair. Maintenance does not include the alteration or enlargement of drains. The boards may construct drains across railroad rights-of-way or utility installations. When the construction of a drain across a highway necessitates the reconstruction of a bridge the drainage district involved shall assume the costs of such reconstruction. The district must pay for damage to land outside the district caused by its activities. Where landowners of a district desire more thorough or different drainage and the drainage board determines that public health and welfare will be served, subdistricts may be formed to facilitate drainage. Dams found by the court to obstruct drainage may be removed. The owners of lands assessed for drainage expenses but inaccessible to existing drains may petition to have connecting drains constructed. (Dye-Florida)
W70-03204

DIVISION OF WATER.
Ohio Rev Code Ann secs 1521.01 thru 1521.13, 1521.41, 1521.42 (1964), as amended, (Supp 1970).

Descriptors: *Ohio, *Water resources, *Water resources development, *Water management (Applied), Legislation, Legal aspects, Wells, Surface waters, Subsurface waters, Aquifers, Water conservation, Water supply, Water utilization, Planning, Watersheds (Basins), Regulation, Water pollution, Investigations, Hydroelectric power, Flood control, Permits, Surveys, Hydrologic data, Ohio River, Utilities, Watercourses (Legal), Reservoirs, New York State Barge Canal, Dikes, Levees, Dams, Eminent domain, Administrative agencies.
Identifiers: *Salt Fork Lake.

'Water resources' means all surface waters occurring in channels and all subsurface waters occurring in aquifers which are available or may be made available to agricultural, industrial, commercial and domestic users. The Division of Water is created within the Department of Natural Resources. The Division of Water will: (1) collect, study and interpret all available data pertaining to the supply, use, conservation and replenishment of the underground and surface waters of the state; (2) be authorized to perform stream gauging within the state (3) advise the political subdivisions of the state regarding water conservation and ground water recharge; (4) regulate the drilling and operation of wells to prevent subsurface water contamination; (5) conduct a basic inventory of the water resources in each drainage basin within the state and develop a plan for the management of such resources; and (6) investigate flood control problems within the state. Entities engaged in well-digging must keep logs thereof and must furnish copies to the Division. No dam may be constructed without first obtaining a permit from the Division. The Division will control and maintain certain named reservoirs, dams, and canals. The Division will construct, control and manage the Salt Fork Lake project. (Keith-Florida)

4B. Groundwater Management

OBSERVATIONS ON WATER CONTENT CHANGES IN STRATIFIED SEDIMENTS DURING PIT RECHARGE,
Arizona Water Resources Research Center, Tucson.
L. G. Wilson.
Paper presented at 50th Annual Meeting of American Geophysical Union, Wash, DC, Apr 23, 1969. 40 p, 10 fig, 2 tab, 21 ref. OSW Grants No 14-01-0001-630 and 14-01-0001-1805.

Descriptors: *Pit recharge, *Sediments, *Flow characteristics, *Arizona, Flow, Alluvium, Basins, Water table, Piezometers, Hydraulic gradient, Drainage, Wells, Observation wells.
Identifiers: *Stratified sediments, Basin-fill stratigraphic units.

Two principal flow regimens were observed during Arizona pit recharge studies in stratified sediments overlying the 80-foot deep water table. The uppermost region was observed near the interface between the alluvium and basin-fill stratigraphic units. The lowermost region was apparent above the water table in materials of the basin-fill unit. Three main stages prevailed in the history of the two flow regimens: development stage, equilibrium stage, and drainage stage. Water content profiles, flow characteristics and piezometer data are discussed for these stages. It is concluded that cyclic recharging is a more effective management technique than continuous inundation in order to maximize recharge volumes. A regeneration of an open surface is apparently promoted by periodic drying periods thus sustaining favorable lateral hydraulic gradients. (Carstea-USGS)

THE LAW OF UNDERGROUND WATER; A HALF-CENTURY OF HUBER V MERKEL,
David L. Uelmen.
Wis L Rev, Vol 1953, No 3, p 491-515, May 1953. 25 p, 117 ref.

Descriptors: *Percolating water, *Underground streams, *Subsurface waters, *Confined water, Legislation, Judicial decisions, Reasonable use, Diversion, Wisconsin, New York, Hawaii, California, Water resources, Water policy, Water law, Prior appropriation, Water conservation, State governments, History, Natural gas, Oil, Exploitation, Administrative agencies.
Identifiers: *Common law.

Beginning with its origin in 1843, the author traces the development of the law of underground water. Non-statutory rules are discussed first. These fall into three groups: (1) the English Rule or common law rule; (2) the American Rule or reasonable use rule; and (3) the California Rule or the doctrine of correlative rights. In discussing these and later topics, the author utilizes judicial decisions to reveal the development of the law. Diversions of underground streams and diversions of percolating and artesian waters are treated in separate sections. The effect of malice in relation to underground water law is discussed. A summary of the non-statutory law is included. Various statutory materials are then discussed in relation to the problem of waste. The balance of the paper contains a development of Wisconsin's history in this area. The laws of New York and Hawaii are also discussed. The author concludes that the problem is to find the best method of regulating water for the benefit of the state without doing violence to the rights of private owners. Much of the law is said to be based on erroneous scientific and economic materials. Reference is made to a proposed statute designed to effectuate this policy. (Schram-Florida)
W70-02898

THE LAW OF UNDERGROUND WATER; A HALF-CENTURY OF HUBER V MERKEL (STATUTORY MATERIALS),
David L. Uelmen.
Wis L Rev, Vol 1953, No 3, p 503-515, May 1953.

Descriptors: *Wisconsin, *Subsurface waters, *Reasonable use, *Diversion, Legislation, Water policy, Water law, Oil, Natural gas, Administrative agencies, Regulation, History, Exploitation, Public rights, Confined water, Water conservation, Percolating water, Water resources, Economics, Well regulations.

Satutory materials relating to waste of underground waters are discussed. Statutes from several states declare that artesian wells must be capped to prevent waste when the water is not being used. One group of states has declared uncapped artesian wells to be a nuisance, with the owner being guilty of a misdemeanor. Wisconsin statutory law is discussed. In Wisconsin liability for waste depends upon whether the owner allowed the well to discharge more water than reasonably necessary and whether such action materially diminished the flow of another well in the vicinity. Various cases distinguishing natural gas and oil from water are discussed. After dealing with the laws in several other states, the author makes some general conclusions. He defines the problem as being the finding of the best method of regulating water without doing violence to the rights of private owners. Many of the extreme methods used today are based upon erroneous scientific and economic materials. The public interest is sufficient to justify legislation to prevent exploitation and waste by the owner of the land under which the water lies. (See W70-02898). (Schram-Florida)

THE ARTESIAN SYSTEM IN GEORGIA: STRATIGRAPHY AND HYDROLOGY OF THE OCALA,
Georgia University, Athens, Geology Dept.
Mark Rich, and Edward A. Stanley.
PB-189 041, Partial Completion Report, Georgia Water Resources Center, Nov 1969. 11 p, 6 tab, 20 ref. OWRR Project A-006-GA.

Descriptors: *Stratigraphy, *Paleohydrology, *Petrography, *Limestones, Porosity, Calcareous soils, Sedimentary petrology, Georgia.
Identifiers: *Ocala Limestone, *Little Stave Creek, Alabama, *Rich Hill Section (Georgia), *Coccoliths.

The report summarizes studies of rocks belonging to the Jackson Group in Southwestern Georgia (the Ocala Limestone). The stratigraphy of the Ocala is outlined. Field and laboratory work is documented including petrographic and stratigraphic analysis. Paleontological studies and analyses of the Ocala Limestone indicate that the necessary zonations and correlations could be made on the basis of calcareous nannoplankters. Biostratigraphic zonation of the Alabama Little Stave Creek section based on the distribution of 45 species of Coccolithophores showed three distinct units within the Eocene deposits. Use of nannoplankters in Georgia has been limited by widespread silification of the Ocala exposures. The report indicates that Coccoliths will prove to be useful for future subsurface studies in Georgia when it is known that silification of the Ocala Limestone has not taken place. WATER AVAILABILITY IN URBAN AREAS OF THE SUSQUEHANNA RIVER BASIN - A PRELIMINARY APPRAISAL,
Geological Survey, Albany, N.Y.
Robert D. MacNish, Allan D. Randall, and Henry F. H. Ku.
New York Water Resources Commission Report of Investigation RI-7, 1969. 24 p, 15 fig, 6 ref.

Descriptors: *Water management (Applied), *Conjunctive use, *Streamflow, *Induced infiltration, *New York, Hydrographs, Hydrograph analysis, Statistical models, Statistical methods, Water storage, Aquifers, Water reuse, Artificial recharge, Low-flow augmentation.
Identifiers: *Susquehanna River basin, (N Y).

Using the mean of the logs of the monthly average flows, an average annual hydrograph was constructed for major streams in the three largest urban areas in the Susquehanna River basin in New York State. This logarithmic-based average hydrograph more nearly approximates daily flows than an arithmetic-base average hydrograph. Comparison of this hydrograph and the storage potential of local aquifers enables determination of the required volumes of upstream storage, or recycling of treated waste waters and artificial recharge necessary to sustain maximum induced infiltration and pumpage from groundwater storage. The desirability of using treated waste water in artificial recharge or streamflow augmentation is enhanced by the fact that recycling 60 percent of the treated waste water can double water availability for these urban areas. (Knapp-USGS)

ACCURACY OF WELL DISCHARGE COMPUTATIONS FROM CURVES OF THE DISCHARGE AS A FUNCTION OF THE DROP IN WATER LEVEL (TAKING THE DZHEZKAZGAN REGION AS AN EXAMPLE),
V. N. Ostrovskiy, and M. A. Khordikaynen.
Transl from Trudy Inst Gidrogeologii i Gidrofiziki, Akad Nauk Kazakhskoy SSR, Vol 1, p 198-201, 1968. Soviet Hydrology: Selected Papers, No 4, p 363-365, 1968. 3 p, 1 tab, 7 ref.

Descriptors: *Wells, *Groundwater movement, *Groundwater recharge, *Karst, Observation wells, Equations, Statistical methods, Specific yield, Water levels, Discharge (Water).
Identifiers: *USSR, Dzhezkazgan.

Pumping tests showed that the ratios between the well discharge and the level of the fissure-karst waters of the Dzhezhazgan region, USSR, are fairly complex. The following formulas were used: (1) The Dupuis for pressureless waters; (2) Krasnopol'skiy; (3) Keller; (4) Smreker; and (5) Al'tovskiy. Statistical analysis showed that: (1) Keller's parabolic relationship gave the most accurate results for prospecting wells; (2) Keller's formula was also best suited for computations of the specific discharges of prospecting and operational wells. Further discussion of other formulas is presented. (Carstea-USGS)

A REVIEW AND REVITALIZATION: CONCEPTS OF GROUNDWATER PRODUCTION AND MANAGEMENT--THE CALIFORNIA EXPERIENCE,
University of Southern California, Los Angeles. School of Law.
Robert I. Reis.
Natural Resources Journal, Vol 7, p 53-87, No 1, Jan 1967. 67 ref.

Descriptors: *Groundwater basins, *Legal aspects, California, Judicial decisions, Administrative agencies, Storage, Water supply.
Identifiers: Groundwater management.

The nature of legally protected interests in groundwater production must be redefined. In California, judicial allocation of water resources traditionally has been based on a limited natural supply. Imported water, by increasing the supply, brings this judicial approach into question. The most efficient method of meeting water requirements would be to pipe in imported water at a constant rate equal to base requirements, and to use the basin as a storage facility for peaking and cyclic needs. This method requires conceptual recognition of the basin as a place of storage. Section I highlights the evolution by which California water rights cases have projected protection of the basin's storage qualities. Three cases are analyzed in detail. Section II discusses the problems left unanswered by use of settlement agreements. Section III offers organizational alternatives for correcting settlement practices. Alternatives include open market allocation, regulatory controls, and state ownership and control. Private settlements have provided optimal conditions in the past, but future problems require coordinated dispensation of all available water source and storage facilities. Only a central agency can serve this need. (Gossen-Chicago)

Descriptors: *New Jersey, *Subsurface waters, *Well regulations, *Well permits, Legislation, Percolating water, Water resources, Administrative agencies, Regulation, Wells, Drilling, Legal aspects, Diversion, Withdrawal.
Identifiers: *Well sealing, Penalties (Civil).

A permit must be obtained from the Division of Water Policy and Supply of the State Department of Conservation to divert water from subsurface or percolating sources in excess of 100,000 gallons per day in areas delineated by said division where such diversion threatens to exceed the natural replenishment of such waters. Existing diversion of water at the time of this act or of the delineation of an area may be continued without a permit. Abandoned wells must be sealed and filled. The Division may order such sealing, and enforce such an order and any provisions of this act in the superior court. No person, partnership or corporation shall drill a well unless he is a licensed well driller. Operations on the drilling or construction of wells shall be under the immediate supervision of a licensed well driller. No well shall be drilled without a permit as required by this act. A report to the Department must be filed giving a description of wells drilled. The Division shall have power to investigate and inspect the construction and repair of wells throughout the state. Violations of this act are punishable by a fine of $100 to $250. (Sisserson-Florida)

GROUNDWATER RECHARGE THROUGH MODIFIED SHAFTS,
Agriculture Research Service, Bushland, Tex. Southwestern Great Plains Research Center.
D. C. Signor, V. L. Hauser, and O. R. Jones.
American Society of Agricultural Engineers, Transactions, Vol 12, No 4, p 486-489, 1969. 8 fig, 21 ref.

Descriptors: *Shafts (Excavations), *Groundwater recharge, *Aquifers, *Groundwater mining, *Recharge wells, Irrigated land, Groundwater, Surface runoff, Water table, Water resources, Agriculture, Evaporation, Piezometry, Overdraft, Hydraulic mining, Sands, Irrigation, Water quality, Turbidity, Texas, Playas, Drawdown.

Groundwater mining for irrigation from the Ogallala Formation under west Texas has caused serious decline in the water table - a common problem in arid and semiarid regions. Surface runoff from about 90% of the high plains of Texas, accumulating in natural depressions and playas, amounts to 2.5 to 3.0 million acre feet per year lost to evaporation. If this water could be diverted to recharge the aquifer, the agricultural life of the area could be prolonged and a reduced area of irrigated agriculture supported indefinitely. The authors report an experiment in which shafts were dug into the aquifer under a playa to recharge the aquifer. Observation wells and piezometers were also located in the area. Recharge rates through plain shafts ranged from 90 to 220 gallons per minute. A shaft modified by hydraulically mining a cavity deep in the aquifer sands increased recharge with clear water to 788 gallons per minute-a rate considered satisfactory. Some trouble was encountered with entrapped air at high recharge rates. It was also concluded that muddy water would have to be clarified before recharge to prevent aquifer surface plugging. The study has not continued long enough to determine what effects there may be from groundwater mounding under a recharge well. (Crouse-Arizona)

Identifiers: *Australia, Porous rocks.

Since most of Australia is arid or semiarid, groundwater becomes extremely important. There is detailed knowledge of groundwater for small areas of the country, but for the most part the groundwater resources are known in only a very general basin-wide level. This report reviews the geology of Australia from the standpoint of aquifer characteristics of the rock structures. Water bearing rocks fall into three categories: (1) unconsolidated sediments, (2) porous rocks, and (3) fractured rocks. Most of the usable groundwater in arid Australia is contained in pore spaces of sandstones and limestones occurring in sedimentary basins which cover about one-half of the arid zone. These structures tend to be flat lying and are hundreds to thousands of feet in thickness, but are inter-layered with relatively impervious materials. This tends to produce artesian conditions in some places. The stored water has accumulated over geologic time and although great in quantity, is probably not being recharged at the rate of withdrawal for irrigation, livestock watering and domestic use. At least half of the groundwater supply is too mineralized for irrigation. In areas of crystalline rocks there are modest supplies of groundwater in the fractures or thin surface deposits of unconsolidated material. (Crouse-Arizona)

4C. Effects on Water of Man's Non-Water Activities

SALTWATER INTRUSION IN THE UNITED STATES,
American Society of Civil Engineers, New York. Hydraulics Div.
C. B. Sherwood, A. E. Bruington, and W. J. Drescher.
Proc Amer Soc Civ Eng, J Hydraul Div, Vol 95, No HY5, p 1651-1669, Sept 1969. 19 p, 1 tab, 7 ref, append.

Descriptors: *Encroachment, *Saline water intrusion, Groundwater, Salt water barriers, United States, *Saline water, Aquifers, Injection wells, Saline water-freshwater interfaces, Groundwater geology, Brine disposal, Underground water storage, *Salinity, *Sea water, Contamination, Brines, Water wells, Fresh water.

Salt-water intrusion into fresh groundwater formations is almost always the inadvertent result of some activity of man working to improve his environment. Three general mechanisms by which intrusion occurs are: (1) the reversal or reduction of groundwater gradients, allowing heavier saline water to move into an underground area where only fresh water existed before; (2) the accidental or inadvertent destruction of natural barriers that formerly prevented movement of salt waters or separated bodies of fresh and salt water; and (3) the accidental or inadvertent result of disposing of waste saline water. The occurrence of saline water is described in terms of geologic and hydrologic conditions. The extent of salt-water intrusion is given using a listing of 68 examples from throughout the United States. Statements are included regarding some areas where major control efforts are underway. PROBLEM OF ALLOWING FOR THE INFLUENCE OF AGRICULTURAL MELIORATION PRACTICES ON FLOW IN THE CONSTRUCTION OF A GENERAL PLAN FOR THE UTILIZATION AND PROTECTION OF THE WATER RESOURCES OF THE USSR,
B. B. Leont'yevskiy.
Transl from GGI, Sbornik Rabot po Gidrologii, No 8, p 58-66, 1968. Soviet Hydrology: Selected Papers, No 4, p 374-380, 1968. 3 tab, 12 ref.

Descriptors: *Water resources, *Water level fluctuations, *Agricultural watersheds, Watersheds (Basins), River flow, Forest management, Soil management, Soil conservation, Steady flow, Water management (Applied), Water conservation.
Identifiers: *USSR.

Two main opposing concepts regarding the influence of agricultural melioration practices on river flows are critically evaluated. These concepts are: (1) Agricultural and forest melioration practices do not reduce the normal flow to any significant extent; (2) the practices will change the water balance of the steppe and forest-steppe zones and the normal flow will decrease substantially. American data on the subject from the Mill Creek, Ohio, suggest that agricultural practices and an increase in yield will probably have no significant effect on the normal flow of large and medium rivers. More research in this field is strongly recommended. (Carstea-USGS)

CONSTRUCTION OF STATE HIGHWAY WHICH RESULTS IN DESTRUCTION OF WELL USED FOR POTABLE WATER SUPPLY.

NJ Stat Ann secs 27:7-21.1, 27:7-21.2 (1968-69 Supp).

Descriptors: *New Jersey, *Wells, *Highways, *Replacement costs, Cost repayment, Compensation, Costs, Cost sharing, Payment, Government supports, Construction costs, Reimbursable costs, Highway effects, Road construction, Water wells, Legislation, Legal aspects, Potable water.

Where a well providing an adequate supply of potable water is destroyed by the construction of a state highway and the construction of a new well is necessitated, the State Highway Commissioner may pay the owner of the well such portion of the cost of a new well as the Commissioner deems just or the cost of extending an existing municipal or private water main to the affected property. Payment is made only if a new well is actually constructed, and such payment shall never exceed the cost of construction. (Dye-Florida)

ACQUISITION OF LAND FOR PUBLIC RECREATIONAL PURPOSES - WATERSHED PROTECTION AREAS.
Wis Stat Ann secs 60.18 (15), 60.18 (21) (1957), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Watershed management, *Water resources, *Dam construction, Land, Legal aspects, Dams, Rivers, Recreation, Conservation, Natural resources, Land resources, Costs, Bodies of water, Public benefits, Financing, Local governments, Recreation facilities, Lake shores, Legislation.

At any annual town meeting the qualified electors may vote to authorize the town board to acquire land, river fronts, and lake shores for public use to construct and maintain dams within such tracts for recreational purposes, and to raise and expend money in developing watershed protection areas. (Casey-Florida)
W70-02913

SOIL CONSERVATION DISTRICTS LAW.
Ark Stat Ann sec 9-902 (1956), as amended, (Supp 1967).

Descriptors: *Arkansas, *Erosion control, *Erosion, *Soil conservation, Water loss, Legislation, Legal aspects, Soil erosion, Silting, Sedimentation, Streams, Channels, Reservoirs, Dams, Ditches, Harbors, Wildlife conservation, Navigation, Irrigation, Flood control, Water resources development, Land use.
Identifiers: Subsurface water loss, Corrective methods, Desilting basins.

Improper land-use practices continue to cause serious land erosion by water and wind. The consequences of such soil erosion include the silting and sedimentation of stream channels, reservoirs, dams, ditches, and harbors. Further consequences include water loss, fish loss, flooding, diminishing of the underground water reserve, and losses in navigation, municipal water supply, and irrigation developments. The corrective methods to conserve soil resources and prevent erosion include: appropriate soil conservation and land-use practices; structures for flood prevention, water development and conservation; construction of terraces, check dams, desilting basins, channel improvements, ponds and ditches; land drainage; land irrigation, the storage, transportation, and sale of water for irrigation, municipal or industrial water supply purposes; and a rural domestic water supply system. It is the policy of the legislature to provide for the foregoing corrective methods in order to preserve natural resources, control floods, prevent impairment of dams and reservoirs, assist in maintaining the navigability of rivers and harbors, and to accomplish other purposes. (Keith-Florida)

5A. Identification of Pollutants

RADIOTRACER PROCEDURES FOR MECHANISTIC STUDIES IN AIR POLLUTION RESEARCH,
Bureau of Mines, Washington, D.C.
M. L. Whisman, and Basil Dimitriades.
Bur of Mines Report of Investigations Report RI-7304, Oct 1969. 36 p, 3 fig, 14 tab, 12 ref, 5 append.

Descriptors: *Air pollution, *Water pollution sources, *Radioactivity, *Tracers, *Smog, Trace elements, Atmosphere, Carbon, Statistical methods, Analytical techniques.
Identifiers: *Photochemical reactions (Smog).

Radiotracer techniques were developed for stoichiometric studies of photochemical reactions associated with atmospheric smog formation. Stock blends of separate hydrocarbon and oxygenated compounds were prepared and calibrated. C-14-labeled reactants and products in reaction systems involving hydrocarbons and nitrogen oxides at the ppm level were analyzed for qualitative and quantitative data. These methods developed for preparation and calibration of gas phase blends at a level of about 1000 ppm are applicable to low-molecular weight material (ethylene, butene) and to high-boiling materials such as m-xylene and mesitylene. Analytical methods developed for quantitative measurement of radioactivity products show the estimated precision level, with the exception of formaldehyde, plus or minus 2 percent. (Gabriel-USGS)

A REVIEW OF CHEMICAL MEASUREMENTS IN WATER POLLUTION CONTROL,
Federal Water Control Administration, Washington, D.C. Div. of Pollution Surveillance.
D. G. Ballinger.
Water and Sewage Works, p R38-R40, R42, 1968. 8 tab, 3 ref.

Descriptors: *Analytical techniques, *Water pollution control, *Water quality, Aquatic life, Chemical properties, Domestic water, Fish, Industrial water, Irrigation water, Livestock, Pesticides, Wastes, Wildlife, Water criteria.
Identifiers: Pollution parameters, Public water supply, Water quality parameters.

Selection of chemical parameters for use in evaluating water quality is discussed in relation to the desired water usage. Parameters required for fish, aquatic life and wildlife protection, and those necessary in the evaluation of waste loads are also reviewed. (Chalk-Wisconsin)
W70-02984

CLAY MINERAL STABILITY AND WATER COMPOSITION,
Washington State Univ., Pullman.
J. A. Kittrick.
Final Report for FWPCA Grant 16060 DGK, Nov 1969. 7 p, 1 fig.

Descriptors: Free energy, *Clay minerals, Soil chemistry, Soil water, Phase diagrams, Weathering, *Montmorillonite, *Illite.
Identifiers: Soil mineralogy, Soil solution, *Vermiculite, *Mineral.

The application of solubility methods to determining the standard free energy of formation of several soil minerals is summarized. Each of three illites and two vermiculites were found to be unstable relative to other minerals that form in the solution environment of soils and sediments. Illite may form in the ocean where muscovite is stable. Vermiculite derived from trioctahedral micas appears to be merely an unstable intermediate in all natural waters. Each of two montmorillonites were stable in water of specific compositions, as illustrated by a stability diagram. It is evident that minerals and the waters they contact interact to control aspects of each others composition.
W70-03026

EVALUATION OF WATER QUALITY TRENDS, SHENANDOAH RIVER, VIRGINIA, FRONT ROYAL TO BERRYVILLE,
Federal Water Pollution Control Administration, Charlottesville, Va. Middle Atlantic Region.
John W. Baumeister.
Federal Water Pollution Control Administration, Middle Atlantic Region Technical Report 2, Dec 1968. 14 p, 5 fig, 5 tab, 20 ref.

Descriptors: *Water quality, *Water pollution, *Rivers, Water chemistry, Water pollution sources, Phosphorus, Nitrogen compounds, Eutrophication, Productivity, Algae, Aquatic life.
Identifiers: Shenandoah River.

Physical and chemical data collected at the Berryville Surveillance Station were evaluated to determine pollution and eutrophication trends in the main stem of the Shenandoah downstream from Front Royal. Chemical quality was within the raw water criteria established for public water supplies; however, total phoshorus and nitrogen content of river water was sufficiently high to indicate a fertile stream capable of producing abundant aquatic organisms. Thirteen years of bottom samples collected over a 30 yr period in this reach show a gradual increase in the productivity of aquatic invertebrates. For the most part, these samples contained clean water and facultative forms which indicate the presence of relatively clean water. Phytoplankton numbers and population composition during the period 1962-1965 indicate a change from a diatom dominated population to one dominated by green algae. Nuisance algae were not

present in quantities sufficient to cause water treatment problems. (Knapp-USGS)
W70-03068

POLLUTION OF WATER BY MINERAL OIL; GAS CHROMATOGRAPHIC DETERMINATION OF OIL TRACES IN WATER (DUTCH),
R. Jeltes.
English summary. H2O, Vol 2, No 17, p 403-405, Aug 21, 1969. 3 p, 2 fig, 1 photo, 12 ref.

Descriptors: *Pollutant indentification, *Oily water, *Gas chromatography, Analytical techniques, Surface waters, Groundwater, Oil wastes, Industrial wastes.
Identifiers: Oil waste identification.

Contamination of surface and groundwater with mineral oil products is a matter of growing concern. This type of contamination may be detrimental for the quality of drinking water prepared from such waters. In the investigation of these pollutants, analytical chemical methods of determination are necessary. Attention is given principally to the determination of oil components in true solution (aromatic hydrocarbons), which are most detrimental. The method described is based on extraction of the oil from water and subsequent gas chromatographic analysis of the resulting extracts. Determination of the origins of oil components in water appears to be possible in certain cases. The method developed has been applied in the laboratory and in the field. (Knapp-USGS)
W70-03085

SOME PROBLEMS CONCERNING THE THERMAL REGIME OF RIVERS IN THE ARAKS BASIN,
S. M. Musayelyan.
Transl from GGI, Sbornik Rabot po Gidrologii, No 8, p 177-184, 1968. Soviet Hydrology: Selected Papers, No 4, p 408-414, 1968. 4 fig, 4 tab, 4 ref.

Descriptors: *Thermal pollution, *Water temperature, Gaging stations, Rivers, Watersheds (Basins), Heat flow, Air temperature, Hydrologic properties.
Identifiers: *USSR, Araks basin, Thermal regime.

The water temperature was measured at 67 gaging stations in the Araks River basin, USSR between 1950 and 1962. The data were used to determine: (1) the major patterns and characteristics of river water temperature, (2) annual and daily variation, (3) duration of periods of water temperature gradations, and (4) the heat flux. Two types of thermal regime can be distinguished: (1) Type I includes most of the rivers of the region and is characterized by water temperature variations as a function of air temperature; (2) Type II in which the thermal regime is affected by air temperature and by hydrogeological conditions of river feeding. There is a single maximum and a single minimum in the daily river water temperature. The water temperature increases along the rivers and the variations are significant along large rivers. (Carstea-USGS)
W70-03112

LAKE MICHIGAN OPEN WATER AND LAKE BED SURVEY 1968.
Illinois State Sanitary Water Board, Springfield.

Illinois State Sanitary Water Board, Report to the Governor and 76th General Assembly, Apr 1969. 36 p, 6 fig, 15 tab, 6 ref.

Descriptors: *Water quality, *Lake Michigan, *Illinois, *Water pollution, Coliforms, Bacteria, Phenols, Chlorides, Hydrogen ion concentration, Sulfates, Turbidity, Radioisotopes, Ammonium compounds, Nitrogen compounds, Phosphates, Lake beds, Pollution abatement.

During 1968, Illinois State Sanitary Water Board staff monitored Lake Michigan open water. Bottom samples were collected from a boat using sampling dredges. Results of chemical, bacteriological, phytoplanktor and physical examinations were compared to the Department of Interior Water Quality Standards approved in January 1968. Lake Michigan open water quality was judged to be in general compliance with the criteria for coliform bacteria, fecal streptococci bacteria, phenol-like substances, cyanide, chlorides, sulfates, pH, flourides, filterable residue, turbidity and radionuclides. Criteria for ammonia-nitrogen, phosphates, dissolved iron, and methylene-blue-active-substances were exceeded frequently at all of the intakes. Limited sampling and examination of bottom deposits and organisms indicated general compliance with the criteria, except within the breakwater at Calumet harbor and at the North Chicago sewage treatment works outfall. Action is being taken by the Illinois Sanitary Water Board, in conjunction with the other Lake Michigan states participating in two current Federal Enforcement Conferences, to further abate and to control pollution of the lake by discharges from municipal sewer systems, industries, watercraft and other sources. (Davis-Chicago)

5B. Sources of Pollution

ATTENUATION OF SELECTED NITROGEN FORMS BY SORPTION FROM AQUEOUS SOLUTION ONTO NATURAL SOILS,
Michigan State Univ., East Lansing. Coll. of Engineering.
Marvin E. Stephenson, and Raymond Rodrigue.
Available from the Clearinghouse as PB-188 961, $3.00 in paper copy, $0.65 in microfiche. Michigan State University Institute of Water Research, Completion Report, Apr 1969. 135 p, 10 fig, 1 tab, 87 ref, 3 append. OWRR Proj No A-22-MICH.

Descriptors: *Nitrates, *Adsorption, *Clays, *Soil chemistry, Thermodynamics, Path of pollutants, Laboratory tests, Expansive clays, Montmorillonite, Waste disposal, Water treatment, Anion adsorption, Ions, Ion exchange, Cation adsorption.
Identifiers: Nitrate adsorption.

The interaction of nitrates from agricultural waste disposal and other sources with soil materials was studied by equilibrating 200 solutions of nitrates with coarse-size Na and K montmorillonite particles. The literature on the physiological and chemical effects of nitrates is extensively reviewed and a bibliography is included. In the adsorption experiments, the equilibrium pH increased with increasing clay content. Increasing the nitrate concentration up to 32 mg/l caused an increase in the equilibrium pH when the average pH was greater than 8.9 and a decrease when the average pH was less than 8.9. Between 6 deg C and 35 deg C, nitrate anions, in the presence of either Na or K, were repelled from the surfaces of coarse montmorillonite particles whenever the equilibrium nitrate concentration was less than 20 mg/l and the equilibrium pH was between 4.5 and 10.2. Increasing the nitrate concentration reversed the initial increasing trend of the negative adsorption isotherms. (Knapp-USGS)
W70-02843

QUALITY OF WATER IN CHICKAMAUGA RESERVOIR.
Tennessee Valley Authority, Chattanooga. Environmental Hygiene Branch.

Stream Sanitation Staff Report, July 1964. 64 p, 24 fig, 8 tab, appendix.

Descriptors: *Recreation wastes, *Water pollution sources, Water pollution effects, Industrial wastes, Municipal wastes, Pollutant identification, Chemical analysis, Radioactivity, Water quality, Radioactive wastes, Recreation, Strontium, Ruthenium, Cesium, Cobalt, Reservoirs.
Identifiers: Marine craft pollution, Fecal coli, Non-fecal coli, Coliforms, Oak Ridge Atomic Plant, Clinch River (Tenn), Drinking water.

Water quality surveys of this 54 square mile reservoir revealed a significant correlation between discharge of industrial and domestic wastes and density of coliaerogenes, varying from less than 30 to many thousand organisms per 100 milliliter of water--far above drinking water standards. In most parts of the basin, fecal coli comprise a fraction of 1% of total number of coliforms, but the ratio constantly narrows by sewage discharged from towns and marine craft. Sanitary-chemical analyses of water quality included temperature, dissolved oxygen, biochemical oxygen demand, color, odor, and turbidity. Complete analyses of mineral composition were made during one year at monthly intervals. Reservoir receives fractions of the volume of certain low-level radioactive wastes discharged by the Oak Ridge Atomic plant into Clinch River, consequently determinations were made of the radionuclide concentration. Until November 1962, concentration of both cesium-137 and cobalt-60 was below detection limits. Average concentrations of strontium-90 and ruthenium-106 were below maximum allowable level, but in some weeks concentrations of either radionuclide exceeded permissible limits for drinking water. (Wilde-Wisconsin)
W70-02970

AGRICULTURAL CHEMICALS AND OUR WATER RESOURCES,
Purdue Univ., Lafayette, Ind. Dept. of Agricultural Engineering; and Purdue Univ., Lafayette, Ind. Dept. of Entomology.
E. J. Monke, J. E. Fahey, and P. R. Goodrich.
Available from the Clearinghouse as PB-189 088, $3.00 in paper copy, $0.65 in microfiche. Paper presented at 1968 Annual Meeting of American Society for Engineering Education, California University, Los Angeles, June 17-20, 1968. 17 p, 36 ref. OWRR Proj No A-005-IND.

Descriptors: *Water pollution sources, *Water pollution effects, *Regulation, *Agricultural chemicals, *Reviews, Bibliographies, Pesticides, Fertilizers, Organic matter, Nutrients, Eutrophication, Nitrogen compounds, Legislation, Farm management, Land management.
Identifiers: Agricultural effects (Water quality).

Literature pertaining to the effects of agricultural chemicals on water resources was reviewed. An attempt is made to put the contribution of chemicals from agricultural sources in proper perspective and to predict the effect of increasing regulation on the use and methods of application of agricultural chemicals. Proper management of agricultural chemicals from profit and safety motives alone would reduce the levels of unwanted chemicals reaching water supplies. Much greater research effort is needed in all phases of pollution reduction. In general, engineering education should be more concerned with the environment, its measurement and control. (Knapp-USGS)

EVALUATION OF ALTERNATIVE SOLUTIONS FOR ACHIEVEMENT OF RIVER STANDARDS,
Quirk, Lawler and Matusky, New York.
Thomas P. Quirk, and Leonard J. Eder.
Proc, Sixteenth Southern Water Resources Pollut Contr Conf, Duke Univ, p 33-54, Apr 1967. 22 p, 11 fig, 3 tab.

Descriptors: *Water quality control, *Mathematical models, *Simulation analysis, *Biochemical ox-

ygen demand, *Dissolved oxygen, Waste disposal, Waste assimilative capacity, Flow augmentation, Alternative costs, River basins, Temperature, Economics, Standards, Evaluation.

A river of approximately 170 miles in length, with a drainage area of 3,500 square miles was studied. The objectives of the study included; (a) determination of the river's physical characteristics; (b) development of a mathematical simulation model of the river to predict the biochemical oxygen demand (BOD) and dissolved oxygen (DO) profiles under any condition of flow temperature or waste discharges; (c) application of the simulation model to investigate in detail the BOD assimilation capacity under critical weather and flow conditions and the effects of sludge deposits, hydroturbine venting and flow augmentation and; (d) development of the comparative economics of alternative solutions for achievement of proposed water quality standards. The river model was used for the development of the effects on water quality anticipated from the solution components available as well as combination of solutions which appeared practical and economically attractive. (Thiuri-Cornell)
W70-03165

WATER QUALITY PLANNING IN THE PRESENCE OF INTERACTING POLLUTANTS,
Clemson Univ., S.C. Dept. of Environmental Systems Engineering.
Benjamin C. Dysart, III.
42nd Annu Conf, Water Pollut Contr Federation, Dallas, Texas, Oct 1969. 39 p, 18 fig, 2 tab, 15 ref.

Descriptors: *Mathematical models, *Optimization, *River basins, *Water pollution control, *Dissolved oxygen, Temperature, Decision making, Planning, Management, Economic feasibility, Water quality, Standards.

A mathematical optimization model was developed and used to; (a) demonstrate a methodology for water quality planning and management for the interaction of pollutants in the stream, and (b) to minimize total river basin pollution control costs associated with maintaining specific dissolved oxygen (DO) and temperature standards. The Chattahoochee River basin was studied. The study showed that optimal system cost would be most effected by changes in DO standards. Very high DO would be economically prohibitive decreases in temperature standards would be relatively inexpensive. Increases in temperature standards would result in only slight savings for abatement facilities. This type of economic analysis made it possible to compare alternative sets of water quality standards on a common, rational basis for cost affectiveness. It also provided guidance to policy makers. (Thiuri-Cornell)
W70-03168

CONTROL OF WATER QUALITY IN A COMPLEX NATURAL SYSTEM,
Clemson Univ., S.C. Dept. of Environmental Systems Engineering; and Georgia Inst. of Tech., Atlanta.
Benjamin C. Dysart, III and William W. Hines.
IEEE Syst Sci Cyberneties Conf Rec, Phila, p 70-81, Oct 1969. 12 p, 9 fig, 3 tab, 18 ref.

Descriptors: *Water quality control, *Dynamic programming, *Biochemical oxygen demand, *Dissolved oxygen, *Temperature, Constraints, Streams, Thermal pollution, Organic wastes, Systems analysis, Water quality, Standards.

An approach to water quality control was presented for the case where there would be significant interaction of wastes in a stream. In most previous studies, a single pollutant was considered and a single related parameter used as a constraint. The specific pollutants selected for study in the investigation were; (a) biochemical oxygen demand (BOD) and (b) thermal wastes or heat. The related water quality standards were (a) dissolved oxygen concentration (DO), (b) maximum allowable stream temperature, and (c) allowable use in stream temperature. The Chattahoochee River, a free flowing stream which receives thermal and organic wastes was modeled as an N-stage serial system. Two-dimentional dynamic programming technique was used to determine minimum-cost control policies. The response of total system cost and control policy to variation of quality standards was presented. (Thiuri-Cornell)
W70-03170

TRANSPORT OF DISSOLVED WASTES IN RIVERS,
Federal Water Pollution Control Administration, Washington, D.C.; and Texas Univ., Austin. Center for Research in Water Resources.
Roger Don Shull, and Earnest F. Gloyna.
J Sanit Eng Div, ASCE, Vol 95, No SA6, p 995-1012, Dec 1969. 18p, 9 fig, 9 ref, 1 append.

Descriptors: *Mathematical models, *Simulation analysis, *Stochastic processes, *River systems, *Environmental affects, Sorption, Digital computers, Channel flow, Downstream, Flow measurement.
Identifiers: Waste transport, Waste release.

Transport of dissolved radioactive and other tonic wastes was simulated on a digital computer for demonstrating possible environmental effects of wastes discharged to rivers in low concentrations over several decades. The mathematical model was based on experimental aquarium and river model data which was sealed to prototype parametric values. Waste transport in large unregulated rivers was simulated over long distances for periods of many years. River simulation included monthly stochastic flow variation flooding, variable channel shape, tributary flow, sorption of wastes by stationary components of the benthal systems, and erosion of the benthal at high flows. Large variations in downstream waste transport rates in river receiving a constant, continious waste release were shown to be a function of channel sorption of wastes, flow variability, and benthal erosion resistance. (Thiuri-Cornell)
W70-03174

5C. Effects of Pollution

MICRONUTRIENT REQUIREMENTS FOR GREEN PLANTS, ESPECIALLY ALGAE,
Charles F. Kettering Research Lab., Yellow Springs, Ohio.
Clyde Eyster.
Algae and Man, Jackson, Daniel F, editor, Plenum Press, NY, p 86-119, 1964. 11 fig, 2 tab, 174 ref.

Descriptors: *Nutrient requirements, *Plant growth, *Algae, Elements (Chemical), Chlorophyta, Cyanophyta, Chlorella, Manganese, Photosynthesis, Oxygen, Carbon dioxide, Scenedesmus, Chlorophyll, Iron, Chelation, Enzymes, Chlorine, Light intensity, Nitrate, Euglena, Calcium, Ammonium salts, Nitrogen fixation, Boron, Azotobacter, Molybdenum, Cobalt, Copper, Sodium, Magnesium, Potassium, Sulfur, Phosphorus, Hydrogen.
Identifiers: Macronutrients, Micronutrients, Chlorella pyrenoidosa, Autotrophic growth, Heterotrophic growth, Ankistrodesmus, Nostoc muscorum, Scenedesmus obliquues, Scenedesmus quadricauda, Porphyridium cruentum, Lemna minor, Photophosphorylation, Vanadium, Zinc, Euglena gracilis, Anabaena cylindrica, Bacillus subtilis, Aspergillus oryzae niger, Silicon, Phanerogams.

Five elements, manganese, iron, chlorine, zinc, and vanadium are generally required by algae and green plants for photosynthesis. Manganese and chlorine have a role in oxygen evolution. Vanadium accelerates photosynthesis under high light intensity but this effect has been reported only for Scenedesmus obliquus and Chlorella. Iron is the metal part of at least two plant cytochromes which occur in the chloroplasts of green cells and probably facilitates transfer of electrons during photosynthesis. Role of zinc in photosynthesis is uncertain; it may aid in hydrogen transfer since sinc is known to be the metal constituent of various dehydrogenases. Nitrogen fixation in algae having the capacity to fix gaseous nitrogen, requires the following elements: boron, calcium, iron, molybdenum, and perhaps cobalt; these elements may be required for one or more other functions. Critical concentration of an element for its two or more functions is usually much higher for nitrogen fixation. Algae which are forced to fix nitrogen have high boron and calcium requirements. Place of cobalt utilization is uncertain. Some evidence indicates that small concentrations of manganese, calcium, boron, cobalt, copper, and silicon are required for other metabolic functions. (See Vol 2, No 19, Field 5C, entry W69-07832). (Jones-Wisconsin)
W70-02964

ENVIRONMENTAL CONDITIONS AND THE PATTERN OF METABOLISM IN ALGAE,
Westfield Coll., London (England). Dept. of Botany.
G. E. Fogg.
Algae and Man, Daniel F. Jackson, editor, Plenum Press, NY, p 77-85, 1964. 22 ref.

Descriptors: *Algae, *Metabolism, *Environments, Variability, Chlorella, Carbon, Temperature, Light intensity, Nutrient requirements, Nitrogen, Nitrogen fixation, Photochemical, Carbon dioxide, Synthesis, Enzymes, Chlorophyta, Rhodophyta, Scenedesmus, Chlamydomonas, Ecology, Phosphorus, Sulphur, Hydrogen ion concentration, Time.
Identifiers: Botryococcus braunii, Metabolic pattern, Anabaena cylindrica, Glycolysis, Tricarboxylic acid cycle, Autoradiography, Monodus subterraneus, Navicula pelliculosa, Xanthophyceae, Bacillariophyceae, Nitzschia palea, Myxophyceae, Chlamydomonas moewussi, Fat accumulation.

A single strain of algal specie may show remarkable variations in intensity and pattern of its metabolic activities, depending on exposure conditions. Effects of light intensity, temperature, and hydrogen ion concentration on rates of individual metabolic processes and on their final growth in cell numbers are known, yet the differential effects that these conditions may have on different processes are largely unknown. Time factor is significant; temperature changes may produce marked alterations in the balance of major anabolic algal processes. Availability of metabolites may affect metabolic pattern, apart from changes on overall metabolic rate. In algal populations growing exponentially, synthesis of proteins and other protoplasmic constituents predominate and directly utilize intermediates of the photosynthetic carbon cycle. A similar effect is perhaps involved in excretion of glycolic acid from photosynthesizing cells. Algae is able to produce adaptive enzymes and metabolic pattern is determined primarily by relative activities of the various enzyme systems. It is unclear whether fat accumulation in nitrogen-deficient cultures results from halting of the developmental cycle at a point at which fat synthesis predominates. Factors affecting fat accumulation are discussed. (See Vol 2, No 19, Field 5C, entry W69-07832). (Jones-Wisconsin)
W70-02965

A PRELIMINARY BIBLIOGRAPHY ON EXTENT AND CAUSES OF EARLY MORTALITY IN FRESHWATER FISH (DIADROMOUS FISHES EXCLUDED),
Utah State Univ., Logan. Utah Cooperative Fishery Unit.
Robert H. Kramer.
Food and Agriculture Organization of the United Nations, Rome, FAO Fisheries Circular No 307, Jan 1969. 20 p, 191 ref.

Descriptors: *Bibliographies, *Freshwater fish, *Mortality, *Fish, *Juvenile fishes, Environmental effects, Fishkill, Water pollution effects, Fish populations, Lampreys, Salmonids, Wind, Piles, Waves (Water), Minnows, Temperature, Catfishes, Killifishes, Diseases, Sunfishes, Dissolved oxygen, Bass, Foods, Perches, Fungi, Darters, Behavior, Hydrogen sulfide, Groundwater, Light, Salinity, Predation, Water levels, Radiation.
Identifiers: Sturgeons, Paddlefish, Osmerid fishes, Goldeyes, Persopsid fishes, Sciaenid fishes, Atherinid fishes, Bottom type, Commensal spawning, Morphology, Population density, Siltation, Cannibalism.

Published data overwhelmingly support the hypothesis that strength of year-class in freshwater fishes is established very early in their life history, often prior to the completion of the larval period. This preliminary bibliography, comprising some 191 entries, documents this hypothesis. It was compiled for circulation among specialists, with objective of soliciting for suggestions, corrections, and additons. Citations are largely from the English-language literature published between 1886 and 1968, of which approximately 51% were published in the decade beginning 1960. The following headings are included in a subject index (with number of citations pertaining to each indicated in parentheses): Behavior (8); bottom type (6); commensal spawning (6); disease (3); dissolved oxygen (15); food (16); fungus (3); groundwater (2); hydrogen sulfide (2); light (10); morphology (5); pollution (15); population density (2); predation and cannibalism (21); radiation (2); salinity (1); siltation (4); water level (18); water temperature (48); wind and wave action (6). A species index is also provided. (Eichhorn-Wisconsin)

THE ORIGIN AND QUANTITIES OF PLANT NUTRIENTS IN LAKE MENDOTA,
Wisconsin Univ., Madison.
Gerard A. Rohlich, and William L. Lea.
Lake Investigations Committee Report, Wisconsin Univ, Madison, 1949. 8 p, 6 tab.

Descriptors: *Eutrophication, *Agricultural wastes, *Algae, *Lakes, *Tributaries, Sampling, Flow, Analysis, Fertilization, Plant growth substances, Sewage, Sulfate, Manganese, Iron, Carbon dioxide.
Identifiers: *Inland, Horizontal sampling, Vertical sampling, Lake Mendota (Wis), Lake Monona (Wis), Lake Waubesa (Wis), Lake Kegonsa (Wis), Weed beds, Phosphorus, Nitrogen balance.

To obtain a comprehensive picture of eutrophication dynamics of Lake Mendota, Wisconsin, three series of stations--inland, horizontal, and vertical--were established on the lake and its tributaries. Analyses of samples collected at inland stations enabled determination of nutrients retained in the lake. Sampling stations of the horizontal series formed transects from upper parts of streams to their mouths and into the lake. These stations provided information on the modification of original nutrient concentration by weed beds and algae. Vertical series stations were located in two 65-foot-deep and one 80-foot-deep holes. Sampling of three water horizons--surface, thermocline at 10 meters, and about 0.5 meters above the bottom--aimed to reveal variation in nutrient concentration and aquatic biomass with depth. Lake's inflow-outflow balance constituted 130 plus or minus 1.2 cubic feet/second. Analyses of chemical factors included pH, alkalinity, dissolved oxygen, biochemical oxygen demand, soluble phosphorus, total phosphorus, free ammonia nitrogen, total organic nitrogen, nitrite, nitrate, sulfates, silicates, manganese, and iron. During the year 17,460 pounds soluble phosphorus entered the lake, the amount corresponding to an application of 1.8 pounds/acre of lake surface. Enrichment in organic nitrogen, largely in nitrate form, amounted to 259,720 pounds, equivalent to fertilization of 26.7 pounds/acre. (Wilde-Wisconsin)

SEASONAL DISTRIBUTION, CONSTITUTION, AND ABUNDANCE OF ZOOPLANKTON IN LAKE ERIE,
Memorial Univ. of Newfoundland, St. Johns. Marine Sciences Research Lab.; and Memorial Univ. of Newfoundland, St. Johns. Dept. of Biology.
Charles C. Davis.
Journal Fisheries Research Board of Canada, Vol 26, No 9, p 2459-2476, 1969. 5 tab, 14 ref.

Descriptors: *Distribution patterns, *Lake Erie, *Zooplankton, Daphnia, Cyclops, Rotifers, Protozoa.
Identifiers: Asplanchna, Bosmina, Ceriodaphnia, Chydorus, Cladocera, Cyclops, Diaptomus, Holopedium, Keratella, Mesocyclops, Polyarthra, Tropocyclops, Lake Erie Basins.

Distribution, constitution, and abundance of zooplankton in Lake Erie are given on the basis of vertical zooplankton hauls from 28 stations. Among Protozoa, Vorticella, Epistylis, and Codonella were dominant in West Basin in October 1967; Codonella being also abundant in Central and East Basins with Epistylis occurring minimally. In January 1968, Vorticella was abundant in West and Central Basins, Codonella occurring in smaller numbers. Among larger zooplankton at least 15 species (9 genera) of rotifers, 9 species (7 genera) of cladocerans and 13 species (7 genera) of copepods were encountered. Distinct differences in zooplankton populations occur in the three basins of the lake. October biomass of cladocerans and copepods was greatly reduced as compared with July. Among cladocerans Bosmina coregoni occurred mainly in East and Central Basins; B longirostris was more abundant in Western Basin. Copeopd populations of Western Basin were greatly impoverished as compared with other basins. Ratios of seston, chlorophyll a and phytoplankton among three basins exhibited a progressive decrease from west to east. A possible instance of winterkill of microcrustacea was noted in January 1968. (Voigtlander-Wisconsin)

PRELIMINARY INVESTIGATION OF THE EXPLOITATION OF SOME POTENTIAL NUTRITIONAL RESOURCES BY THREE SYMPATRIC TUBIFICID OLIGOCHAETES,
Toronto Univ. (Ontario). Dept. of Zoology.
Ralph O. Brinkhurst, and Kian E. Chua.
Journal Fisheries Research Board of Canada, Vol 26, No 10, p 2659-2668, 1969. 2 fig, 3 tab, 24 ref.

Descriptors: *Lake Ontario, *Oligochaetes, *Tubificids, Amino acids, Bacteria, Detritus, Water pollution.
Identifiers: *Nutritional resources, *Toronto Harbor (Canada), *Tubifex, Glycine, Nutrient uptake, Limnodrilus, Peloscolex, Saginaw Bay (Michigan), Lake Huron.

Three species of tubificids (Tubifex tubifex, Limnodrilus hoffmeisteri, Peloscolex multisetosus) characteristic of areas polluted by high amounts of organic matter were studied to determine their utilization of heterotrophic bacteria and glycine. Eight species of bacteria were cultured from mud samples taken from Toronto Harbor. Seven bacteria developed at any one time, with Chromobacterium and Aeromonas alternating in the samples. Peloscolex gut contents yielded all seven species of bacteria; Limnodrilus and Tubifex did not contain Aeromonas; Pseudomonas was absent from Tubifex. Laboratory cultures of worms indicated only one bacterial species survived passage through guts, a different bacterium for each tubificid. Studies on uptake of C-14 tabelled glycine indicated insignificant uptake by Tubifex and Limnodrilus. Significant uptake was demonstrated in Peloscolex, glycine being concentrated in the chloragogen surrounding the intestine. Results may indicate differences in utilization of potential nutritional resources by the three species. Free organic matter and microflora available as food for detritus feeders may be more relevant to their ecology than more commonly investigated physical and inorganic factors. Tabular data include results of bacterial identifications from filed and laboratory studies. (Voigtlander-Wisconsin)

IN VITRO RESPONSES OF SOFT WATER ALGAE TO FERTILIZATION,
Ontario Water Resources Commission, Toronto. Div. of Research.
A. E. Christie.
Division of Research Paper No 2024, Aug 1969. 16 p, 2 fig, 4 tab, 9 ref.

Descriptors: *Bioassay, Phytoplankton, Lakes, Eutrophication, Sampling, Surfaces waters, Carbon, Fertility, Algae, Nitrogen, Phosphorus, Water pollution effects.
Identifiers: *Twelve Mile Lake (Canada), *Ontario, *Canada, Nutrient levels, Soft water.

A 'preliminary' single sample from oligotrophic Twelve Mile Lake, Ontario, was bioassayed by spiking with sodium bicarbonate, potassium nitrate, and potassium dihydrogen phosphate, or combinations of these compounds. Bottles were carried 21 days at 20 C under a diurnal cycle of 14 hours light and 10 hours dark under the extremely high light intensity of 4000-foot-candles. The sample's indiginous population served as the assay response organisms, and were measured by Areal Standard Units. The only response by the algae in the sample was to a combination of nitrogen and phosphorus. (Gerhold-Wisconsin)

DO MARINE CRUSTACEANS RELEASE DISSOLVED AMINO ACIDS,
Virginia Inst. of Marine Science, Gloucester Point; and Georgia Univ., Athens. Dept. of Zoology.
Kenneth L. Webb, and R. E. Johannes.
Comparative Biochemistry and Physiology, Vol 29, p 875-878, 1969. 11 ref.

Descriptors: *Crustaceans, *Marine animals, *Amino acids, Bacteria, Ammonia, Nitrogen, Phosphorus, Invertebrates, Incubation, Amphipoda, Copepods, Metabolism, Density.
Identifiers: *Amino acid release, Calanus helgolandicus, Calanus chilensis, Palaemonetes pugio, Bacterial action.

Marine bacteria multiply rapidly within a few hours when sea water is enclosed in containers, increasing in numbers by several orders of magnitude. Many species of heterotrophic marine bacteria whose nutrient requirements have been published have been shown to require one or more amino acids for maximum growth. Surfaces of zooplankters and their fecal pellets provide abundant seed of bacteria in incubation vessels. For this reason, incubation times should be held to a minimum to avoid serious loss of amino acids from solution. The new experiments described indicate the general effect bacteria have on dissolved amino acid levels during prolonged incubations. Previous workers give tables in which all eight species of aquatic crustaceans cited were found to release dis-

solved amino acids. Serious errors arise in the measurement of release of dissolved amino acids by marine animals if incubation times exceed a few hours. Longer incubation periods allow bacteria to reach high densities and to remove significant quantities of amino acids from solution. This probably explains the conflict between researchers who find that marine crustaceans release dissolved amino acids and those who fail to detect this release. (Jones-Wisconsin)

ARE DISSOLVED AMINO ACIDS AN ENERGY SOURCE FOR MARINE INVERTEBRATES,
Georgia Univ., Athens. Dept of Zoology; and Virginia Inst. of Marine Science, Gloucester Point.
R. E. Johannes, S. J. Coward, and K. L. Webb.
Comparative Biochemistry and Physiology, Vol 29, p 283-288, 1969. 1 tab, 30 ref.

Descriptors: *Marine animals, *Invertebrates, *Amino acids, *Energy, Radioactivity techniques, Organic compounds, Carbon radioisotopes, Georgia, Salinity, Sea water, Biological membranes.
Identifiers: Amino acid uptake, Release, Bdelloura candida, Specific activity, Sapelo Island (Georgia), Microbial contaminants, Marine invertebrates, Amino acid loss, Putter's theory.

Marine invertebrates possess high concentrations of free amino acids (FAA) in their tissues several orders of magnitude higher than FAA levels in sea water. Labeled FAA entering these animals are presumably diluted with large endogenous unlabeled FAA pools with resulting pronounced decrease in specific activity. Subsequent release of labeled FAA from the animals into the medium in quantities that are small relative to the amounts of uptake cannot be assumed to indicate that the amount of unlabeled FAA released is also small. A unit of carbon-14-labeled FAA moving out of the animals will represent the flux of a greater quantity of unlabeled FAA than a unit of carbon-14 moving into them. Removal of radioactively labeled organic compounds from solution by marine invertebrates does not constitute proof of net uptake of these compounds. Observations on uptake of carbon-14-labeled dissolved FAA and the release of total dissolved FAA by Bdelloura candida, indicate the net flux of these compounds is outside the animal. Evidence is discussed indicating that there is a net loss of dissolved FAA by various other marine invertebrates. (Jones-Wisconsin)

MOULTING OF EUPHAUSIA PACIFICA AS A POSSIBLE MECHANISM FOR VERTICAL TRANSPORT OF ZINC-65 IN THE SEA,
Oregon State Univ., Corvallis. Dept. of Oceanography.
Scott W. Fowler, and Lawrence F. Small.
International Journal of Oceanology and Limnology, Vol 1, No 4, p 237-245, 1967. 3 tab, 10 ref.

Descriptors: *Zinc radioisotopes, *Oceans, Pacific Ocean, Plankton, Migration patterns, Temperature, Salinity, Nuclear explosions, Nuclear reactors, Retention, Oregon, Columbia River, Radioactivity, Sampling, Adsorption, Depth, Surface waters, Columns, Phytoplankton, Food webs, Pollution, Euphausiids.
Identifiers: *Euphausia pacifica, *Vertical transport, *Moulting, Exoskeletons, North Pacific Ocean, Pycnocline, Uptake, Richland (Washington), Specific activity, Halocline, Exuvia, Hanford Nuclear Reactors.

In large concentrations of zinc-65, exoskeletons of Euphausia pacifica accumulate substantial loads of the isotope. As E pacifica is an abundant vertical migrant in North Pacific, moulting approximately every five days, heavy zinc-65 accumulation in exoskeletons could be a major mechanism of vertical transport of the isotope. Moulted exoskeletons averaged 41% of total body activity prior to moulting in uptake experiments, and in loss experiments 18%. Percentage loss from animals alternately accumulating and losing activity was about 30%. Zinc-65 activity in case exoskeletons correlated roughly with whole body activity before moulting, but apparently was not correlated with water temperature, animal size, or initial zinc-65 concentration. Lack of correlation with these factors probably was due partially to exoskeleton size differences and exuvia removal from experimental flasks at only 24-hour intervals. Zinc-65 loss rates from animals via moulting were computed for three hydrographic conditions common in North Pacific. Assuming same concentrations of zinc-65 under these conditions, highest loss rate was in a well-mixed water column (zinc-65 homogeneously distributed), lowest rate when zinc-65 was distributed above a pychocline in summer. Sinking of radioactive exuvia and ingestion of exuvia by other organisms is discussed. (Jones-Wisconsin)
W70-02978

GROWTH RATE AND BODY COMPOSITION OF FINGERLING SOCKEYE SALMON, ONCORHYNCHUS NERKA, IN RELATION TO TEMPERATURE AND RATION SIZE,
Fisheries Research Board of Canada, Nanaimo (British Columbia). Biological Station.
J. R. Brett, J. E. Shelbourn, and C. T. Shoop.
Journal Fisheries Research Board of Canada, Vol 26, No 9, p 2363-2394, 1969. 17 fig, 8 tab, 49 ref, appendix A, B.

Descriptors: *Growth rates, *Sockeye salmon, Efficiencies, Feeding rates, Food abundance, Maintenance, Temperature, Sampling, Fish.
Identifiers: Body composition, Calorific values, Gross efficiency, Net efficiency, Oncorhynchus nerka, Bioenergetics, Experimental tanks.

Growth of fingerling sockeye salmon was studied under controlled laboratory conditions at temperatures of 1, 5, 10, 15, 20 and 24 C in relation to artificial rations of 0, 1.5, 3, 4.5 and 6% of dry body weight/day and at excess rations. Optimum growth occurred at about 15 C for two highest rations and shifted progressively to lower temperatures at each lower ration. Maximum growth rates varied from 2.6% per day (5-7 month-old fish) to 1.6% per day (7-12 month-old fish). Maintenance requirement varied from approximately 0.4% weight/day at 1 C to 4% at 23 C, rising rapidly above 12 C. Curves relating ration and growth rate were logistic for 20 C and geometric at lower temperatures. No growth was noted at 23 C under excess rations. Calculated isopleths indicated maximum gross efficiency of 25% at 11.5 C and 4% weight/day ration and maximum net efficiency of 40% in the range 8-10 C and 0.8 (maintenance level) to 1.5% weight/day ration. Proximate analyses revealed ranges of water, protein, and fat from 86.9, 9.4, and 1.0% respectively at 20 C after 83 days starvation to 71.3, 19.7 and 7.6% at 15 C and excess rations. ACUTE TOXICITY OF ZINC TO THE KILLIFISH, FUNDULUS HETEROCLITUS,
Bureau of Sport Fisheries and Wildlife, Highlands, N.J. Fish-Pesticide Research Lab.
Ronald Eisler.
Chesapeake Science, Vol 8, No 4, p 262-264, 1967. 2 fig, 9 ref.

Descriptors: *Toxicity, *Killifishes, Salinity, Hydrogen ion concentration, Temperature, Spectroscopy, Marine fish, Freshwater fish, Estuarine environment.
Identifiers: *Zinc, *Fundulus heteroclitus, Gill arch, Liver.

During preliminary experiments on effects of sublethal concentratns of insecticides to marine organisms, it was observed that zinc and other metals accumulate in selected tissues of several species. Quantitative date on zinc toxicity to marine fishes were lacking. Effects of different levels of sinc in seawater on the mummichog were explored. Groups of adult Fundulus heteroclitus were subjected to varying concentrations of zinc as zinc chloride at 24 parts/thousand salinity, pH 8.0 and 20 C. At 192 hours, all mummichogs exposed to 43 parts/million or less of zinc were alive and externally indistinguishable from the controls. There were no appreciable differences of zinc content in various tissues, (determined by atomic absorption spectroscopy) regardless of the initial amount of zinc in solution. All mummichogs subjected to 157 parts/million or 180 parts/million of zinc died between 24 and 48 hours. Dead mummichogs were separated into liver, gill arch, and remainder (primarily carcass); they contained about 7 and 8 times more zinc in whole fish and in gill arch, respectively, than controls, thus providing an index of sinc-caused mortality for the species. (Jones-Wisconsin)

THE ECOLOGY OF A DIATOM COMMUNITY IN A THERMAL STREAM,
Washington Univ., Seattle. Dept. of Zoology; and Freshwater Biological Association, Ambleside (England).
John G. Stockner.
British Phycological Bulletin, Vol 3, No 3, p 501-514, 1968. 5 fig, 4 tab, 26 ref.

Descriptors: *Physiological ecology, *Diatoms, *Thermal water, *Streams, Nutrients, Bioindicators, Phosphates, Nitrates, Bicarbonates, Hot springs, Hydrogen ion concentration, Thermal pollution, Alkalinity, Carbonates, Conductivity, Iron, Sodium, Sedimentation, Cores, Potassium, Epiphytes, Magnesium, Paleoecology, Sulfates, Washington, Chlorides, Water chemistry, Water pollution.
Identifiers: *Thermobiology, Epipetic flora, Total dissolved solids, Rhopalodia, Denticula, Mastogloia, Amphora, Navicula, Nitzschia, Caloneis, Diploneis, Surirella, Photobiology, Seasonal effects, Anomoeoneis, Epithemia, Gomphonema, Pinnularia, Achnanthes, Phosphorus (Total), Mount Rainier National Park, Ohanapecosh Hot Springs (Wash), Oedogonium.

The structure of diatom communities has been used as a bioindicator of manmade river pollution. Suitable parameters of community structure include a species diversity index derived from the Shannon-Wiener information function (H, the negative summed product, for species 1 to s, of proportion of each species by its natural logarithm) and the redundancy, a measure of degree of repetitious counting ($R = 1 - H/\ln s$). Community structures of diatoms in stream draining one of the Ohanapecosh Hot Springs, Washington, were examined during 1964-1967. Despite large seasonal changes in abundance and shifts in species composition, values for H generally did not deviate significantly from the mean, such relative constancy being interpretable as an indication of community stability. The conclusion is that stream strikingly resembles culturally polluted waters and characteristic pattern of species abundance is attributed to their light adaptation. Three cores, obtained from the soft sediments of the spring, were analyzed for diatom remains. Cores were dated on the basis of a pumice layer of known age, and interpretations bearing on paleoecology of the diatom community added a significant temporal dimension to annual analyses. OXIDATION REACTIONS OF NITROGEN IN WATER RECEIVING SECONDARY TREATMENT PLANT EFFLUENTS,
Cornell Univ., Ithaca, N.Y. Water Resources and Marine Sciences Center.
Charles D. Gates.
Available from the Clearinghouse as PB-189 044, $3.00 in paper copy, $0.65 in microfiche. Cornell University Water Resources and Marine Sciences Center Technical Report No 15, June 1969. 15 p, 3 fig, 3 tab, 39 ref. OWRR Project A-012-NY.

Descriptors: *Biochemical oxygen demand, *Oxidation, *Nitrification, *Biodegradation, *Nutrients, Waste disposal, Sewage effluents, Laboratory tests, Waste dilution, Water quality.
Identifiers: Biological treatment plant effluents, Effluent oxidation.

Microbiological and engineering studies on the oxidation or inorganic nitrogen in controlled laboratory studies and in natural waters receiving wastewater are reviewed. Laboratory studies were undertaken to learn the nature and stoichiometry of the reactions, particularly the long-term oxidation, of the inorganic nitrogen constituents of a biological secondary wastewater treatment plant effluent in the receiving water. The progressive oxygen demand of an effluent, diluted with water from the stream to which it is discharged, incubated at 20 deg C, was followed for periods of up to 40 days. In all cases the oxygen consumption curves showed a phase interpreted as the oxidation of inorganic nutrients. Inability to establish natural environmental conditions in the laboratory seriously hampers in vitro studies of the nitrification phenomenon. (Knapp-USGS)

TEMPERATURE AND TURBULENCE EFFECTS ON THE PARAMETER (DELTA) IN THE STOCHASTIC MODEL FOR BOD AND DO IN STREAMS,
Virginia Polytechnic Inst., Blacksburg. Water Resources Research Center; Virginia Polytechnic Inst., Blacksburg. Dept. of Sanitary Engineering; and Virginia Polytechnic Inst., Blacksburg. Dept. of Statistics.
Joseph R. Bosley, John J. Cibulka, and Richard G. Krutchkoff.
Available from the Clearinghouse as PB-189 086, $3.00 in paper copy, $0.65 in microfiche. Virginia Polytechnic Institute Water Resources Research Center Bulletin 33, Nov 1969. 33 p, 10 fig, 3 tab, 11 ref. OWRR Proj No A-027-VA, FWPCA Grant No WP-01216-01.

Descriptors: *Dissolved oxygen, *Reaeration, *Biochemical oxygen demand, *Turbulence, *Water temperature, Water pollution effects, Streamflow, Oxygen sag, Waste assimilative capacity, Statistical models.
Identifiers: Dissolved oxygen calculations.

A literature review and laboratory study were made of the effects of water temperature and turbulence on dissolved oxygen and BOD in streams. Methods used to calculate the effects of pollution upon the assimilative capacity of a stream are reviewed. The equations available in the literature make possible calculations of BOD and dissolved oxygen concentrations if initial conditions and dynamic parameters are known. A series of simulated DO sag curves under varying conditions of temperature and turbulence were developed in the laboratory. These were accomplished by probe measurements of dissolved oxygen in a series of test solutions to which glucose feed solutions were added. The stream parameters were estimated and the parameter delta, the incremental DO change, was calculated under each test condition. A plot of temperature versus delta and turbulence versus delta demonstrated that the parameter was of a physical nature. This concept of delta allows an investigator to predict a range of dissolved oxygen values given a set of initial conditions. The probability of any actual DO value falling within this range may also be obtained, allowing intelligent pollution control decisions to be made based on the probability function. (Knapp-USGS)
W70-03066

EFFECTS OF THERMAL STRATIFICATION UPON OXYGEN RESOURCES - JOHN H. KERR RESERVOIR,
Federal Water Pollution Control Administration, Charlottesville, Va. Middle Atlantic Region.
Robert C. Horn, and Russel H. Wyer
Federal Water Pollution Control Administration Middle Atlantic Region, Technical Paper TS-1, June 1968. 15 p, 6 fig, 1 tab, 1 map.

Descriptors: *Water quality, *Dissolved oxygen, *Stratification, *Reservoirs, *Virginia, Thermal stratification, Epilimnion, Hypolimnion, Water pollution sources, Water quality act, Water quality control, Water resources development, Reservoir operation.
Identifiers: *Roanoke River (Va), John H. Kerr Reservoir (Va).

During the 1967 stratification period, a study was made of the oxygen resources of the John H. Kerr Reservoir and Roanoke River, Virginia. Vertical sections of dissolved oxygen and temperature were sampled at 14 stations in the reservoir throughout the summer. These parameters were monitored continuously in the tailrace and several times at 9 stations along the course of the river below the dam. Thermal stratification takes place in the reservoir between June and September; stratification was similar for all years. The thermocline is 20-40 ft deep and most clearly defined in July and August. Dissolved oxygen concentrations in the hypolimnion generally range from 0.0 mg/l to 2.5 mg/l throughout the reservoir in July, August, and the first weeks of September. Most of the water passing through the penstocks is drawn from the oxygen-deficient hypolimnion resulting in contravention of State Water Quality Standards immediately below the dam for approximately two months each summer. No significant relationship exists between magnitude of discharge and dissolved oxygen in the tailrace. (Knapp-USGS)
W70-03070

THE EFFECTS OF THERMAL POLLUTION ON RIVER ICE CONDITIONS: 2. A SIMPLIFIED METHOD OF CALCULATION,
Army Terrestrial Sciences Center, Hanover, N.H.
S. Lawrence Dingman, and Andrew Assur.
Cold Regions Research and Engineering Laboratory Research Report No 206, Part 2, Aug 1969. 10 p, 3 fig, 1 tab, 5 ref, 1 append. DA Task No 1T061102B52A02.

Descriptors: *Thermal pollution, *Ice, *Melting, *Heat balance, Heat transfer, Water temperature, Equations, Heated water, Path of pollutants.
Identifiers: Heat loss equations.

Equations are presented and explained for use in calculating heat loss rates, temperature profiles, and lengths of ice-free reaches caused in rivers by thermal pollution sources. The use of computers is not necessary to solve the equations, which are linear functions of the difference between water temperature and air temperature. Another simple procedure for calculating heat losses is based on air temperature, wind speed, solar radiation, and general atmospheric conditions. (Knapp-USGS)

5D. Waste Treatment Processes

OXIDATION PONDS REMOVE BACTERIA,
Department of Water Resources, Durham, N.C.
J. R. Malone, and T. L. Bailey.
WATER AND SEWAGE WORKS, Vol 116, No 4, p 136-140, Apr 1969. 2 fig, 3 tab, 9 ref.

Descriptors: *Oxidation lagoons, *Disinfection, *Tertiary treatment, Pilot plants, Coliforms.
Identifiers: *Bacterial removal, *Nutrient stripping enterococci, Durham, N.C.

This article reports the results of a pilot plant study. Tertiary oxidation ponds can be used to substitute for chlorination of plant effluents at a financial saving. Furthermore, benefits in reduction of BOD and turbidity and plant breakdown buffering capacity add to the reasons for preferring the ponds over chlorination. Short-lived radioisotopes in hospital and lab wastes are given time to decay before reaching the receiving stream. Algae removal from the pond effluent needs further study. (Ledbetter-Texas)
W70-03040

AERATED STABILIZATION BASIN TREATMENT OF WHITE WATER,
Quirk, Lawler and Matusky, New York.
Thomas P. Quirk.
Water Wastes Engr, Vol 6, No 7, p D.1-D.5, July 1969. 5 fig, 4 tab.

Descriptors: *Biological treatment, *Design data, *Industrial waste, Costs, Cost analysis, Biochemical oxygen demand
Identifiers: *Aerated lagoon, *Stabilization pond, Pilot plant studies, Boxboard wastes, Clarification, Suspended solids, Nutrient addition.

A study of a boxboard manufacturing waste and its biological treatment is described. The performance of an existing clarifier which removed 65 to 95% of the suspended solids (600 to 1800 mg/l) and reduced the BOD by 35 to 40% was studied. A pilot scale aerated stabilization basin was used to study the efficacy of this type of treatment. The addition of nitrogen and phosphorus permit a 75% BOD removal with a short-term basin and a clarifier or a long-term basin without a clarifier. The minimum cost alternative was estimated at about 4.5 cents per pound of BOD removed. (Ledbetter-Texas)
W70-03041

COMBINED TREATMENT OF TANNERY AND MUNICIPAL WASTES,
Syracuse Univ., N.Y. Dept. of Civil Engineering; and Vrooman (Morrell), Gloversville, N.Y.
Nelson L. Nemerow, and Richard Armstrong.
Water Wastes Engr, Vol 6, No 7, p D.6-D.9, July 1969. 5 fig, 3 tab.

Descriptors: *Industrial wastes, *Municipal wastes, Design data, New York, Biochemical oxygen demand, Sludge digestion, Activated sludge.
Identifiers: *Combined wastes, *Tannery wastes, Laboratory models, Stream survey, Conventional treatment.

This report is the result of a consulting study that was made on the wastes and waste treatment at Gloversville and Johnstown, New York. A stream survey was made to determine the BOD removals required to keep the steam DO about 2 mg/1. This survey indicated that 65 to 97% removal would be necessary. Laboratory studies were run to find whether the mixture of the tannery waste and the municipal waste was amenable to treatment by conventional activated sludge process. The recommended treatment scheme varied from the conventional in that a two-stage secondary treatment (high rate roughing filters followed by activated sludge treatment with mechanical aeration) was included. (Ledbetter-Texas)
W70-03042

POLLUTION ABATEMENT OF A DISTILLERY WASTE,
Kentucky Univ., Lexington; Watkins (G. Reynolds), Lexington, Ky.; and Aer-O-Flo Corp., Florence, Ky.
C. E. Burkhead, C. A. Lessig, and T. R. Richardson.
Water Wastes Engr, Vol 6, No 5, p C.20-C.22, May 1969. 2 fig, 4 tab, 12 ref.

Descriptors: *Industrial wastes, *Activated sludge, *Design data, Costs, Construction costs, Heat transfer, Biochemical oxygen demand, Biological treatment.
Identifiers: *Pilot studies, *Distillery wastes, *Oxygen transfer, Suspended solids, Settleable solids, Brewery wastes.

Operating data for a pilot plant waste treating operation is described. A 5000-gal holding tank (for cooling wastes) and a 10,000-gal extended

aeration activated sludge tank (including a 1670-gal settling unit) were used to treat loadings of 4250 to 10,500 gal per day of wastes. BOD removals ranged from 77 to 97% (avg of 91.5%) at loadings of 3 to 27 lb/day-1000 cuft (avg of 18 lb). The volume of the holding tank is included in the loading calculations. The effluent quality must be of the order of 20 to 30 mg/l BOD. Aerated lagoons give an economical adaptation of the activated sludge process. In addition to BOD removal, the large surface area enhances heat removal from the hot wastes. The aerated lagoon design was for a pond 3 feet deep with 5 days retention. The pond may be operated at a depth of 5 feet if necessary to get the desired effluent quality. The cost of the pond construction is estimated at $71,000. (Ledbetter-Texas)
W70-03043

ENGINE PLANTS RECOVER AND REUSE OIL FROM WASTEWATER,
Ford Motor Co., Cleveland, Ohio. Cleveland Engine Plants.
S. J. Halasz, C. C. Keil, and G. J. Schutt.
Water Wastes Engr, Vol 6, No 5, p C.24-C.28, May 1969. 2 fig.

Descriptors: *Skimming.
Identifiers: *De-emulsification, *Oil removal, Settling lagoon, Cutting oils, Soluble oils, Reclaimed oil, Water recycle.

A treatment system that reclaims oil from wastewater at the engine plant of Ford Motor Co. in Cleveland is described. Lubricating oil, honing oil, and hydraulic oil are insoluble and will float to the surface for skimming along with varying amounts of the soluble cutting oils. Most of the soluble oil is in an inverted emulsion which is broken by heating with de-mulsifying agents. The mixture is put into a settling lagoon where it separates into three fractions--oil, oil-water mixture, and water. The oils are removed, treated, and reclaimed. The water is returned to the surge tank for reuse. This treatment scheme has resulted in a better oil and a savings in cost. (Ledbetter-Texas)
W70-03044

REMOVAL OF ORGANIC COLLOIDS BY MICROFLOTATION,
Clarkson Coll. of Technology, Potsdam, N.Y.; and Ohio State Univ., Columbus. Water Resources Center.
E. A. Cassell, A. J. Rubin, H. B. LaFever, and E. Matijevic.
Water Wastes Engr, Vol 6, No 5, p C.7-C.10, May 1969. 9 fig, 2 tab, 19 ref.

Descriptors: *Foam separation, *Model studies, E. Coli, Electrolytes, Tertiary treatment.
Identifiers: *Microflotation, Color removal, Turbidity removal, Bacteria removal.

The application of microflotation or foam separation to the treatment of wastewaters seems practical in many water renovation applications at the present. Microflotation can replace coagulation-sedimentation and be followed by the new high-rate filters. This unit would be compact because of the rapid removal of the color-and turbidity-causing particles. It is also a rapid and efficient method of removing bacteria. Research is needed to better understand the effects of various types of dispersions, electrolytes and/or polyelectrolytes. Test data for the removal of the colloidal materials by foam separation is presented. (Ledbetter-Texas)
W70-03045

MODERN AERATION TECHNIQUES,
Fuller Co., Catasauqua, Pa. Infilco Products Group.
Charles E. Tharp.
Water Wastes Engr, Vol 6, No 6, p 31-33, June 1969. 3 fig, 1 tab, 6 ref.

Descriptors: *Aeration, *Biological treatment, *Activated sludge, Design data, Biochemical, Oxygen demand.
Identifiers: *Aeration equipment, *Oxygenation, *Porous diffusers, Turbine aerators, Brush aerators, Pump-type horsepower, Power consumption.

A description of the basic mechanisms for oxygenation of wastewaters is described. The power requirements for a radial flow surface aerator, a submerged turbine aerator, and porous diffusers are 20, 40, and 50 HP, respectively, for 1 mgd flow with a BOD-5 of 250 mg/l. The article gives design data and practices for aeration during biological wastewater treatment. (Ledbetter-Texas)

NEW APPROACH TO AEROBIC TREATMENT OF WASTES,
Allis-Chalmers Mfg. Co., Milwaukee, Wis. Water Pollution Research.
Fred M. Welch.
Water Wastes Engr, Vol 6, No 7, p D.12-D.15, July 1969. 5 fig, 2 ref.

Descriptors: *Aerobic treatment, *Biological treatment, Dissolved oxygen, Temperature.
Identifiers: *Aerobic digestion, Process development, Hydraulic loading, Chemical oxygen demand, Suspended solids, Revolution rate, Rotating biological contractor.

Tests run on a Rotating Biological Contractor (RBC) using a synthetic sewage developed at the Univ of Wisconsin are described. The concentration of influent was varied from 500 to 4000 mg/l COD and the hydraulic flow rate from 200 to 800 gph. The RBC is a series of rotating disks that are partially submerged and are rotated in the waste. It was concluded that the many process variables make the RBC suitable for treating a wide range of biodegradable wastes. The RBC retains a large fixed biological film, but, unlike the trickling filter, it effectively utilizes the entire film surface area and is not susceptible to clogging. Pilot plant work is being conducted in connection with an industrial application. (Ledbetter-Texas)

STORMWATER DISINFECTION AT NEW ORLEANS,
Pavia-Byrne Engineering Corp., New Orleans, La.; and New Orleans Sewage and Water Board, La.
Edgar H. Pavia, and Crawford J. Powell.
J Water Pollut Contr Federation, Vol 41, No 4, p 591-606, Apr 1969. 10 fig, 1 ref.

Descriptors: *Chlorination, *Storm runoff, *Disinfection, Chlorine, Design, Pumping plants, Coliforms.
Identifiers: *Hypochlorites, *New Orleans, *Lake Ponchartrain, Open channels.

A progress report is given on a project to disinfect storm waters in New Orleans. The project aims to show the feasibility of reducing the coliform count by adding chlorine or hypochlorite at pumping stations and letting disinfection take place in open channels of populated areas. The study will encompass the effect of such treated storm waters when they are discharged into body contact recreational areas. The Lake Ponchartrain area of New Orleans is the site of the test to begin in early 1969. (Ledbetter-Texas)

LABORATORY STUDIES OF TANNERY WASTE TREATMENT,
Washington Univ., St. Louis, Mo.; Vanderbilt Univ., Nashville, Tenn.; and Tennessee State Div. of Streams Pollution Control, Nashville.
H. D. Tomlinson, E. L. Thackston, P. A. Krenkel, and V. W. McCoy.
J Water Pollut Contr Federation, Vol 41, No 4, p 660-678, Apr 1969. 13 fig, 10 tab, 30 ref.

Descriptors: *Industrial wastes, *Activated sludge, *Chemical precipitation, Neutralization, Lime, Pilot plants.
Identifiers: *Tannery wastes, *Chrome tanning, *Alum tanning, *Vegetable tanning, Leather.

The laboratory development of treatment processes for chrome, alum, and vegetable tanning wastes is described. They give the chemical and other characteristics for the various waste streams at the tannery, then present their recommendations for treatment. The recommended practice is separate pretreatment of the spent vegetable tanning liquor (p H adjust and alum coagulation), chrome tanning liquor (pp t with lime), and dye wastes (color removal) followed by a combined biological treatment (completely mixed activated sludge). (Ledbetter-Texas)

CENTRIFUGES CONCENTRATE AND DE-WATER WASTE SYSTEM SOLIDS,
Pennsalt Chemicals Corp., Warminster, Pa. Sharples-Equipment Div.
Frederick W. Keith, Jr.
Water and Sewage Works (Industrial Wastes Supplement) Vol 116, No 3, p IW/10-IW/18, Mar 1969. 11 fig, 1 tab.

Descriptors: *Centrifugation, *Dewatering, *Sludge treatment, Coagulation, Sedimentation, Pulp and paper industry, Municipal wastes, Industrial wastes efficiencies.
Identifiers: *Scroll centrifuge, *Disc centrifuge, Petroleum refinery, Electrochemical machining.

Centrifuges are used on relatively small volume waste streams, usually after gravity concentration. Scroll centrifuges and disc centrifuges are described with applications in paper and pulp industry, petroleum refinery, municipal waste treatment, and electrochemical machining. Efficiency curves are shown for these applications. The authors conclude that the use of centrifuges in wastewater treatment will continue to increase. (Ledbetter-Texas)

WASTEWATER TREATMENT PLANT OPERATIONAL PROBLEMS AT HAIFA, ISRAEL,
Haifa Municipality Sewage Treatment Plant (Israel).
Michael Lubzens.
J Water Pollut Contr Federation, Vol 41, No 3, Part 1, p 413-417, Mar 1969. 2 fig, 1 ref.

Descriptors: *Scum, *Operation and maintenance, *Water reuse, *Detergents, *Ammonia, Irrigation, Salinity, Cotton, Cooling towers, Digestion tanks, Mixing.
Identifiers: *Biofiltration, *Reuse, *Suspended solids.

The Haifa, Israel, wastewater treatment plant treats 8.8 mgd of waste from 270,000 people. The plant is overloaded by 15 to 20 percent and is being doubled in size. The present treatment entails primary sedimentation, two-stage biofiltration, secondary sedimentation and chlorination. The effluent BOD is 35 (summer) to 75 (winter) mg/l after removals of 95% and 86%, respectively. The effluent contains (1) psychoda fly larvae, pupal, and discarded pupal skins because no secondary skimming is practical. (2) 1200 to 1400 mg/l of dissolved solids; (3) 60 mg/l of ammonia; and (4) 15 mg/l of detergents (as ABS). The salinity limits reuse of the effluent to cotton irrigation and the ammonia and detergents prevent its use in cooling towers. Scum on the digesters (up to 10 ft) is causing problems. The new design plans to use the existing plant more effectively and to lower effluent BOD, turbidity and suspended solids. (Ledbetter-Texas)
W70-03051

CANNERY WASTE TREATMENT BY SPRAY IRRIGATION-RUNOFF,
Robert A. Taft Sanitary Engineering Center, Cincinnati, Ohio. Cincinnati Water Research Lab.; and Campbell Soup Co., Napoleon, Ohio.
T. W. Bendixen, R. D. Hill, F. T. DuByne, and G. G. Robeck.
J Water Pollut Contr Federation, Vol 41, No 3, Part 1, p 385-391, Mar 1969. 2 fig, 9 tab, 4 ref.

Descriptors: *Canneries, *Industrial wastes, *Foods, *Tomatoes, Irrigation, Runoff, Soil treatment, Grasslands, Wastewater treatment, Ohio, Chemical oxygen demand.
Identifiers: *Cannery waste, *Spray irrigation, Food processing.

A spray irrigation-runoff system is used to treat the wastes from a tomato-processing plant. The facility employs 5 plots containing a total of 165 acres. The waste is sprayed intermittently, 6 hrs on and 6 hrs off, at the top of 5% grassy slopes and the runoff collected after runs of 100 to 200 ft. Tests show that 30 to 40% of waste runs off, with the treatment efficiencies as follows: COD, 95%; nitrogen, 93%; phosphates, 84% and suspended solids, 97%. Rainfall increases the runoff and decreases the efficiencies. (Ledbetter-Texas)
W70-03052

TREATMENT OF MIXED INDUSTRIAL WASTES AT BAYPORT'S INDUSTRIAL COMPLEX,
Friendswood Development Co., Houston, Tex.
George B. Meriwether.
J Water Pollut Contr Federation, Vol 41, No 3, Part 1, p 440-444, Mar 1969. 1 fig, 2 ref.

Descriptors: *Industrial wastes, *Activated sludge, Biological treatment, Incineration, Cost allocation, Costs, Classification, Waste water treatment.
Identifiers: *Central treatment facility, *Mixed wastes, Houston (Tex), Segregation of wastes.

A central waste treatment facility is described; it is serving 6 industries presently with 6 more industries under construction. The capacity is about 1 MGD now and can be expanded to 40 MGD. The wastes are sorted into 3 classes: a 'clean' stream, a 'biological' stream, and a non-acceptable stream. The first two categories can be treated biologically while the third requires incineration or deep-well injection. The plant charges $0.34 to $0.44 per 1000 gal with BOD up to 250 mg/l and $0.17 to $0.22 per lb of BOD for wastes with BOD greater than 250 mg/l. (Ledbetter-Texas)

ACTIVATED SLUDGE STUDIES AT DECATUR, ILLINOIS,
Decatur Sanitary District, Ill.
Charles E. Hughes, Jr., and Jeramiah F. Reynolds.
J Water Pollut Contr Federation, Vol 41, No 2, Part 1, p 184-198, Feb 1969. 22 fig, 1 tab.

Descriptors: *Activated sludge, *Aeration, *Dissolved oxygen, Efficiencies, Toxicity, Analytical techniques, Domestic wastes.
Identifiers: *Cross roll aeration, *Operating problems, Diffusers, Sparjers, Alpha coefficient, Beta coefficient, Decatur (Ill).

This article describes a study of the operating problems in an activated sludge plant. Toxicity studies showed that toxic materials were not the cause of the problems. Low dissolved oxygen was found to be at the root of the difficulties. The aeration was changed from spiral roll to cross roll and oxygen transfer increased 55 to 60%. The authors recommend standard methods of determination for alpha coefficient, K-sub-L A, and beta coefficient, the ratio of oxygen solubility in the waste to that in water. (Ledbetter-Texas)
W70-03054

OCCURRENCE OF ENTERIC VIRUSES IN WASTEWATER AFTER ACTIVATED SLUDGE TREATMENT,
Municipal Virological Lab., Goteborg (Sweden); and Goteborg Univ. (Sweden). Institutes of Mecical Microbiology.
Ebba Lund, C. E. Hedstrom, and N. Jantzen.
J Water Pollut Contr Federation, Vol 41, No 2, Part 1, p 169-174, Feb 1969. 2 fig, 10 ref.

Descriptors: *Viruses, *Effluents, *Chlorination, *Activated sludge, Isolation, Temperature, Sampling.
Identifiers: *Enteric viruses, *Viral concentrations, Etherization, Sweden.

The authors report the results of a virus survey on weekly samples for 18 months of an activated sludge effluent from a plant serving 40,000 population (Nasetverket). One sample produced no more than 3 types of viruses. The treatment process reduced the viral count by about 1.5 log units (31x) but was much less effective toward the end of the calendar year. They found no effect from in-plant chlorination. (Ledbetter-Texas)
W70-03055

TERTIARY TREATMENT AT METRO CHICAGO BY MEANS OF RAPID SAND FILTRATION AND MICROSTRAINERS,
Metropolitan Sanitary District of Greater Chicago, Ill.
Bart T. Lynam, Gregory Ettelt, and Timothy McAloon.
J Water Pollut Contr Federation, Vol 41, No 2, Part 1, p 247-279, Feb 1969. 36 fig, 9 tab, 7 ref.

Descriptors: *Tertiary treatment, *Cost comparisons, *Activated sludge, Sands, Coagulation, Design criteria, Sedimentation, Computer programs.
Identifiers: *Sand filters, *Microstrainers, Rapid sand filters, Chicago.

Results are reported on 5 months of investigation into tertiary treatment of Hanford Park (Chicago) effluent. A 2 mgd plant with rapid sand filters (traveling backwash) and microstrainer was operated under varying conditions. The sand filter was found to be more economical than the microstrainer for effect achieved, $0.024/1000 gal vs $0.028/1000 gal. Either method with pre-chlorination can meet 5 mg/l suspended solids and 4 mg/l BOD criteria of Illinois Sanitary Water Board. Coagulation with alum did not improve the results achieved. (Ledbetter-Texas)

USE OF AERATED LAGOONS AND PONDS IN REFINERY AND CHEMICAL WASTE TREATMENT,
Texas Univ., Austin. Center for Research in Water Resources; and Humble Oil and Refining Co., Baytown, Tex.
Earnest F. Gloyna, S. O. Brady, and H. Lyles.
J Water Pollut Contr Federation, Vol 41, No 3, Part 1, p 429-439, Mar 1969. 5 fig, 7 tab, 6 ref.

Descriptors: *Lagoons, *Aeration, *Industrial wastes, Stabilization, Ponds, Design criteria, Dissolved oxygen.
Identifiers: *Refinery, *Petrochemicals, Stabilization ponds, Aerated lagoons, Houston (Tex).

This paper describes the staged development of industrial wastewater treatment facility for a refinery and petrochemical complex. Emphasis is directed to the utilization of available land for three series-connected waste stabilization ponds, the implementation of this treatment system with an aerated lagoon and the compatibility of this plan with future collection and treatment requirements. The wastewater management plan includes various in-plan separators, and extraction units, an extensive oil collection and separator system, surface aerators, and 351 acres (142ha) of waste stabilization ponds. Provisions can be made to expand the facility if the waste loads continue to increase or additional waste streams are provided by the petrochemical complex. Allowable BOD loading is 50,000 lb/day (22,600 kg). Recommended volume to the first pond is 7.7 mgd (29,200 cu m/day). BOD removal is 72 percent, COD is 84 and 90 percent. (Ledbetter-Texas)
W70-03057

DIATOMITE FILTRATION IN A BOARD MILL,
Johns Manville Research and Engineering Center, Manville, N.J.
F. B. Hutto, Jr.
Water Wastes Eng (Industrial), Vol 6, No 3, p B.5-B.9, Mar 1969. 5 fig, 1 tab.

Descriptors: *Filtration, *Diatomaceous earth, Pilot plants, Cost analysis, Design data.
Identifiers: *Board mill, Closed recycle, Makeup water.

A closeup recycle of wastewater is described for a Fesco board (perlite, wood pulp, asphalt, and admix) plant in France. A diatomaceous earth filter (celite 545) with a capacity of 300 gpm was installed after pilot plant tests of various filter aids, including perlite. Rotary knives remove the cake from the drum. About 1 ton per week of the celite 545 must be replaced. River water for make up is brought into the system through the rotary precoat filter. Evaporation occurs at approximately 6000 gph, whereas the volume of the loop is only 12000 gal. The success of the closed cycle lay in: successful removal of solids, stabilization of solubles buildup, and return water reused. (Ledbetter-Texas)

OPERATING EXPERIENCE WITH HIGH-RATE FILTERS,
Gary Sheet and Tin Works, Ind.; and United States Steel Corp., Pittsburgh, Pa.
V. F. Frank, and James P. Gravenstreter.
J Water Pollut Contr Federation, Vol 41, No 2, Part 1, p 292-296, Feb 1969.

Descriptors: *Filtration, *Industrial wastes, *Steel, Iron oxides, Wastewater treatment.
Identifiers: *High-rate filters, *Scale, Gary (Ind), Suspended solids, Anthracite, Sand, Gravel.

High-rate gravity filters can remove the iron oxide scale and dust from steel processing water. Twelve filters 15 feet square by 23 feet deep were constructed of 1 foot square concrete blocks covered with 15 in. of gravel, 2 feet of sand, and 5 feet of anthracite. The process produced an effluent with not more than 15 mg/l suspended solids at filtration rates from 16 to 32 gpm/sq ft. The 160,000 gpm ultimate demand can be treated. (Ledbetter-Texas)
W70-03059

ECONOMIC EVALUATION: ALTERNATIVES FOR INDUSTRIAL TREATMENT,
Wichita State Univ., Kans.
Kathleen Q. Camin.
Water and Sewage Works (Industrial Wastes Supplement), Vol 116, No 7, p Iw/8-Iw/13, July 1969. 1 fig, 4 tab.

Descriptors: *Cost analysis, *Cost comparisons, Discount rate, Annual costs, Municipal wastes, Industrial wastes, Interest.
Identifiers: *Primary costs, *Secondary costs, Present value, Time horizon, Revenue bonds.

The alternatives for industrial disposition of wastes are the following: (1) complete treatment by municipality, (2) complete treatment by the industry, (3) partial treatment by industry followed by municipal treatment, or (4) alteration of process to produce less waste and/or lower strength. A hypothetical meat packing plant is used as an example to illustrate the costs of the various alternatives in primary costs (repayment of principal, interest, and operation and maintenance) and secondary costs (penalties, sale of products, and public

relations). The annual costs are computed for trickling filter, anaerobic contact, and anaerobic-aerobic lagoons. The present values of the alternatives show the proper selection of treatment for different interest rates. (Ledbetter-Texas)
W70-03060

SPRAY IRRIGATION OF FERMENTATION WASTES,
Commercial Solvents Corp., Terre Haute, Ind.
Richard A. Woodley.
Water Wastes Eng (Industrial) Vol 6, No 3, p B.14-B.20, Mar 1969. 2 fig, 2 tab, 16 ref.

Descriptors: *Sprinkler irrigation, *Fermentation, Industrial wastes, Maintenance, Vegetation.
Identifiers: *Fermentation wastes, Terre Haute (Ind).

Spray irrigation is used to treat low-volume, high BOD, industrial fermentation wastes at the Commercial Solvents Corp. plant in Terre Haute, Indiana. Seven other treatment methods for various wastewater streams are employed at the same plant. The monthly average applications over the last 3 years ranged from 43,000 gpd to 85,000 gpd with BOD from 300 mg/l to 65,000 mg/l. The treatment has been applied on 180 of the available 372 acres of land. Monitoring is carried out on the wastes and the groundwater under the area. The vegetation is left on the land during spraying. Some corrosion of the aluminum pipe has been noted. Winter operations have not produced problems. (Ledbetter-Texas)

ARMCO'S 100,000- gpm MILL-SCALE WASTEWATER TREATMENT PLANT,
Armco Steel Corp., Middletown, Ohio. Air and Water Pollution Control.
John E. Barker, Richard W. Getter, and Grant A. Pettit.
J Water Pollut Contr Federation, Vol 41, No 2, Part 1, p 301-307, Feb 1969. 7 fig.

Descriptors: *Industrial wastes, *Steel, *Wastewater treatment, Design criteria, Coagulation, Sedimentation, Lime, Vacuum drying, Sludge treatment.
Identifiers: *Mill-scale wastes, *Ferric sulfate, Sludge dewatering polyelectrolytes, Armco, Middletown (Ohio).

The 100,000 gpm (144 MGD) mill-scale, wastewater treatment plant of Armco at Middletown, Ohio, is probably the largest plant of its type in the USA. The plant treats an 86 in. hot strip mill waste in two steps-primary sedimentation and coagulation. The primary treatment unit has 5 sub-systems and the secondary 3. Lime is used to adjust the pH to the range of 8.2 to 8.5 and ferric sulfate used as a coagulant. Four belt type vacuum filters, each with 800 sq ft of filterarea, dewater the sludge which is loaded into gondola cars for disposal. (Ledbetter-Texas)

DESIGN PARAMETERS FOR BOD, SOLIDS AND NUTRIENT REMOVAL BY FOAM FRACTIONATION,
FMC Corp., Santa Clara, Calif. FMC Machinery/Systems Group.
M. Floyd Hobbs.
FMC Corporation, Central Engineering Laboratories, Technical Report R-2737, Dec 1968. 54 p, 14 fig, 12 tab, 12 ref. FWPCA Grant WRRD-30-01.

Descriptors: *Foam fractionation, *Ion exchange, *Surfactants, *Waste water treatment, *Water pollution control, Vegetable crops, Treatment facilities, Pilot plants, Laboratory tests, Ammonium compounds.
Identifiers: *San Jose, *Santa Clara, *San Francisco Bay, FMC Corporation.

Process development studies and laboratory investigations are described for removing nutrients (especially phosphate) and suspended solids from secondary wastewater treatment effluents by a foam fractionation process using a liquid ion exchange surfactant. Bench studies were conducted on synthetic waste waters and secondary effluent from the San Jose-Santa Clara Water Pollution Control Plant. Findings indicate that removal of orthophosphate, nitrate, nitrite, and sulfate ions is possible using a surface active quaternary ammonium chloride, which can be regenerated to the chloride form. During the vegetable canning season, an objectionably high concentrations of sludge particles and oxygen demanding materials are discharged from the local treatment plant into the San Francisco Bay. The form fractionation process recommended should provide substantial reductions of sludge particles, BOD and nutrients to help meet Bay Area regulations. A pilot plant for processing 10 gpm of effluent from the treatment plant was designed. The portable plant is estimated to cost $50,000. The report includes preliminary findings, additional bench-scale studies needed to quantitate previous results on a continuous-flow basis, and an economic evaluation of design parameters. (Poertner-Chicago)

RECLAMATION OF WASTEWATER.
Los Angeles City Dept. of Water and Power, Calif.

Los Angeles, Dept of Water and Power, City of Los Angeles, Oct 1968. 101 p, 30 fig, 11 tab, 55 ref, 8 append.

Descriptors: *Reclaimed water, *Water reuse, *Groundwater recharge, *Groundwater barriers, *Irrigation, Water spreading, Injection, Cooling towers, Water shortage, Recharge.
Identifiers: *Los Angeles, Process water.

This investigation was made to determine what portion, if any, of Los Angeles wastewater can be reclaimed for beneficial uses. The study was divided into three major categories: (1) magnitude of wastewater flows throughout the Los Angeles sewerage system and quality determinations; (2) potential situations for wastewater reuse; and (3) costs. Conclusions were that Los Angeles wastewater can beneficially be used for the following six projects: (1) groundwater recharge by surface spreading of treatment plant effluent at the Headworks, Tujunga and Pacoima spreading grounds; (2) injection of effluent from the Hyperion Treatment Plant into the ground to prevent sea water intrusion (West Coast Basin Barrier Project); (3) supply reclaimed water to Standard Oil's El Segundo Plant for cooling tower and process water; (4) irrigation of golf courses and parks using secondary treatment effluents in the Sepulveda Flood Control Basin; (5) irrigation in Griffith Park; and (6) irrigation of proposed parks in the Santa Monica Mountains with secondary effluent. The report included a recommendation that the City departments of Water and Power and Public works coordinate their efforts to develop and operate these projects. The report concludes that all of Southern California needs new water supplies and recommends wastewater reclamation as economically sound and politically expedient. (Poertner-Chicago)

PRELIMINARY DESIGN OF WASTE TREATMENT SYSTEMS,
Water Resources Engineers, Inc., Walnut Creek, Calif.
D. E. Evenson, G. T. Orlob, and J. R. Monser.
Ind Water Eng, Vol 16, No 1, p 16-21, Feb 1969. 6 p, 9 fig, 2 tab, 6 ref.

Descriptors: *Dynamic programming, *Waste water treatment, *Biochemical oxygen demand, *Dissolved oxygen, *Ponds, Construction costs, Maintenance costs, Interest rate, Capital, Design, Canneries, Seasonal.
Identifiers: Sensitivity analysis.

Dynamic programming techniques were used to find the best waste treatment system for removing biochemical oxygen demand (BOD) and treating solids at the minimum annual cost. A cannery for processing peaches and tomatoes was chosen for demonstrating the usefulness of dynamic programming in preliminary design. Results indicated that the least costly treatment processes for nearly all levels of BOD removal involved some system of ponds. Senstivity analyses were made to determine the influence of such parameters as interest rate, capital recovery period and land cost on both the cost and choice of the best treatment process. For the cannery waste studied, the minimum cost was found to be most sensitive to the length of the canning season, least sensitive to interest rate. In-plant treatment was opted over municipal treatment when BOD removal requirement was below 85%. (Thiuri-Cornell)

TIME CAPACITY EXPANSION OF WASTE TREATMENT SYSTEMS,
Pennsylvania State Univ., University Park; and Stanford Univ., Calif.
Thomas M. Rachford, Russell F. Scarato, and George Tchobanoglous.
J Sanit Eng Div, ASCE, Vol 95, No SA6, p 1063-1077, Dec 1969. 15 p, 4 fig, 4 tab, 15 ref, 1 append.

Descriptors: *Waste treatment, *Economics of scale, *Mathematical models, *Optimization, *Timing, Interest rate, Water demand, Capital cost, Investment, Decision making.
Identifiers: *Time capacity expansion.

A minimum-cost method was developed for quantifying the opposing cost factors of economies-of-scale and the time cost of money as they jointly affect optimal capital investment decisions for the expansion of wastewater treatment systems. For a linear demand growth rate, optimal facility expansion, with regard to both timing and capacity requirements, was determined using a mathematical model. The economic implications of different expansion policies were graphed for various interest rates and scales cost affects, using cost data mathematically formulated as a function of system capacity. The model was used to demonstrate that the optimal timing of facility expansion was a function of the time and cost of money and the economy-of-scale characteristics of that facility and was independent of the absolute capacity of the facility. Further additional economies inherent in individually expanding separable components of wastewater treatment system were quantified by the model. (Thiuri-Cornell)

PRELIMINARY SELECTION OF WASTE TREATMENT SYSTEMS,
Water Resources Engineers, Inc., Walnut Creek, Calif.
D. E. Evenson, G. T. Orlob, and J. R. Monser.

J Water Pollut Contr Federation, Vol 41, No 11, Part 1, p 1845-1858, Nov 1969. 14 p, 9 fig, 1 tab, 6 ref.

Descriptors: *Dynamic programming, *Waste water treatment, *Biochemical oxygen demand, *Dissolved oxygen, *Ponds, *Canneries, Construction costs, Seasonal, Maintenance costs, Interest rate, Capital design.
Identifiers: Sensitivity analysis.

Dynamic programming techniques were utilized to find the best waste treatment system for removing a specified amount of biochemical oxygen demand (BOD) at the least annual expenditures for construction maintenance and operation. This technique was applied to wastes typical of a cannery processing tomatoes and peaches. Results of this application indicated that for nearly all removal levels the least expensive treatment process was some system of ponds. Sensitivity analysis were made to determine the influence of such parameters as interest rate, capital recovery period and land cost on both the cost and choice of the best treatment process. For the cannery wastes studied, minimum cost was found to be most sensitive to the length of the canning season and least sensitive to interest rate. In-plant treatment was opted over municipal treatment when BOD removal requirement was below 85%. It was concluded that dynamic techniques outlined could be applied to the preliminary design of waste treatment system. (Thiuri-Cornell)
W70-03169

USE OF SYSTEMS ANALYSIS METHODS IN DETERMINING NEEDS AND IMPLEMENTING PROGRAMS FOR WASTE TREATMENT FACILITIES.
Federal Water Pollution control Administration, Washington, D.C.

In Examination into the Effectiveness of the Construction Grant Program for Abating, Controlling, and Preventing Water Pollution, Comptroller General of the United States, Report B 166506, Chap 6, p 80-97, Nov 1969. 18 p, 1 fig, 1 tab.

Descriptors: *Water quality control, *Systems analysis, *Pollution abatement, *Planning, *Waste assimilative capacity, Decision making, Water utilization, Waste treatment.
Identifiers: Merrimack River.

The use of systems analysis methods in determining needs and implementing programs for waste water facilities by the Federal Water Pollution Control Administration was discussed. The application of systems analysis to water quality control by Camp, Dresser and McKee particulary on the Merrimack River was presented. It was concluded that through the systems analysis approach to planning and implementing water pollution programs; (a) a least-cost construction plan to achieve water quality standards can be developed that considered the assimilative capacity of waterways, (b) more costly, but perhaps more desirable, alternative schedules could be developed, and (c) decision-makers will be provided with more meaningful data so as to enable them to determine the level of treatment required to achieve established objective and the costs of providing various levels of water uses. A STUDY OF DRAINAGE CONDITIONS ON A HILLSIDE RECEIVING SEWAGE PLANT WASTE WATER EFFLUENT AT WEEKLY INTERVALS,
Pennsylvania State Univ., University Park. Dept. of Agronomy.
Joel Claude Myers.
MS Thesis in Agronomy, Pennsylvania State Univ Graduate School, Sept 1967. 102 p, 27 fig, 29 tab, 31 ref, append. OWRR Project No B-001-PA.

Descriptors: *Waste water disposal, *Sewage effluents, *Irrigation, *Hydrogeology, Infiltration, Runoff, Saturated soils, Soil-water-plant relationships, Piezometry, Drainage, Demonstration watersheds, Observation wells, Irrigation water.
Identifiers: Sewage effluent irrigation.

The effects of sewage disposal by irrigation on soil and drainage conditions of a hillside were investigated by applying 2 inches of chlorinated sewage effluent per week for 2 years. The hillside slope consisted of a heterogeneous complex of Hagerstown-Hublersburg series. Ranges of sand, silt, and clay for example, were as follows: Sand (8-47%), silt (12-49%) and clay (21-72%). These and other soil determinations generally indicated great variability in the soil properties, including soil permeability both along the sloping area and within each site. Extent of perched water tables, which are upheld by layers of very low permeability, was determined at the 7 research sites. Generally the water-table surface was within 4 ft of the soil surface, except in dry summer periods where evapotranspiration was at a maximum. In winter, frost, soil and air temperatures, ice and snow caused variable effects on infiltration. Water storage and transmission were greatly reduced because of the perched water tables near the land surface. (Knapp-USGS)

5F. Water Treatment and Quality Alteration

IRON AND MANGANESE REMOVAL,
Manitoba Water Supply Board.
Jim Adams.
Water and Sewage Works, Vol 116, No 7, p 259, July 1969. 1 p, 1 ref.

Descriptors: *Water treatment, *Iron, *Manganese, Chemical precipitation, Filtration, Filters, Water management (Applied), Oxygenation, Oxidation.
Identifiers: Greensand filters, *Manganese removal.

Methods for removing iron and manganese from water are briefly described. Lime soda treatment is usually effective in removing manganese. On a laboratory scale, the Manitoba Water Supply Board has tried simple aeration to assist in the precipitation of iron and manganese followed by the injection of a 1.0% potassium permanganate solution into the stream. This is then followed by passing the water through a pressure filter containing a manganese greensand bed. The greensand filter will require backwashing possibly every two days, and, in addition, should be backwashed with air one each week. (Knapp-USGS)

PURE DRINKING WATER: REGULATION OF MINIMUM STANDARDS AND OF METHODS FOR OBTAINING PURE DRINKING WATER.

Wis Stat Ann secs 162.01-162.06 (1957), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Water quality control, *Potable water, *Water pollution, Standards, Regulation, Consumptive use, Groundwater, Water sources, Water supply, Public health, Construction, Wells, Well permits, Well regulations, Drilling, Water pumping, Water analysis, Investigations, Sanitary engineering, Water purification, Permits, Administrative agencies, Legal aspects, Legislation, Water pollution control.
Identifiers: Penalties (Civil).

The Department of Resource Development shall prescribe, publish, and enforce minimum standards and rules and regulations for obtaining pure drinking water. The Department is required to establish safeguards against the hazards of impure water supplies, including minimum standards for construction of well pits. The Department has general control of all methods of obtaining groundwater and of the construction of wells. The Department of Resource Development may exercise such powers as are necessary to enforce these provisions. It may: employ needed personnel, conduct investigations and experiments concerning the cause of groundwater pollution, make inspections, and require persons responsible for water supply to determine the purity of that water. All those engaged in well drilling and pump installing shall register with the Department and pay permit fees. Competent sanitary engineers and superintendents of waterworks systems are exempt from registration. Penalties for registration violations are provided. (Duss-Florida)

ECONOMICS OF SPLIT-TREATMENT WATER SOFTENING,
Department of Water, Dayton, Ohio.
Bruce S. Shuey.
American Water Works Association Journal Vol 58, No 1, p 107-112, Jan 1966.

Descriptors: *Economics, *Water softening, *Costs, Water treatment, Alkalinity, Benefits, Economic efficiency, Water quality.
Identifiers: *Split-treatment, *Single-stage softening, *Chemical costs, Soda ash, Carbon dioxide, Dayton (Ohio).

Split-treatment lime-soda water softening can be used under certian restricted conditions. The costs of this process, as opposed to single-stage softening, are compared and the former are found to be more economical. The three reasons for this are discussed and it was found that when a finished water with the minimum total alkalinity is produced and an average of 54 mgd is treated the annual savings amounted to more than $80,000. Modification in the method, resulting in a finished water which has aggressive characteristics, can still be accomplished with an annual saving of $55,000 at the same treatment rate. (Murphy-Rutgers)
W70-02989

THE TECHNOLOGY OF PURE WATER.

Presented at 7th Annual Liberty Bell Corrosion Course, Sept 16-18, 1969. Industrial Water Engineering, Vol 6, No 11, p 16-29, Nov 1969. 14 p, 13 fig, 3 tab.

Descriptors: *Water purification, *Demineralization, *Industrial water, *Water analysis, Quality control, Distillation, Filtration, Ion exchange, Water treatment, Pre-treatment (Water).
Identifiers: Deionization, Industrial ultrapure water.

Papers on quality requirements, preparation, and testing of ultrapure industrial water, presented at the 7th Annual Liberty Bell Corrosion Course sponsored by the National Association of Corrosion Engineers, 1969, are summarized. The main classes of contaminants to be removed and analyzed are particulate matter, ions, and organic material. Tests must be performed on flowing water in the system's output, because storage for any time will alter water quality. The classic pure water system consists of the following steps: (1) coagulation (with or without lime softening depending on the raw water available) and superchlorination; (2) granular bed filtration (sand); (3) activated carbon absorption and dechlorination; (4) ion exchange demineralization; (5) mixed-bed polishers includ-

ing final polishing demineralizers (usually the non-regenerable type); (6) roughing final filters or pre-filters (1-20 micron pore size); and (7) final polishing filters (0.3 - 0.8 micron pores). Conductance is undoubtedly the most commonly used measure of water quality. Even small laboratory units containing only 0.1 cu ft of resin for deionization are routinely equipped with some sort of conductance meter for monitoring water quality. Conductance meters capable of measuring down to the 0.01 - 1.0 micromho range are fairly inexpensive when compared to the cost of the average analytical instrument. Continuous measurement, accuracy, reproductibility, and ability to measure in the desired range all make conductance a common choice for monitoring water quality. (Knapp-USGS)

5G. Water Quality Control

COMBATTING WATER POLLUTION FROM LARGE OIL SPILLS,
George E. Ferguson.
AWWA J, Vol 61, No 12, p 678-680, Dec 1969. 3 p, 13 ref.

Descriptors: *Water pollution sources, *Oily water, *Legislation, *Water works, Oil, Oil industry, Oil wastes, Water pollution treatment, Administrative agencies, Fouling, Taste, Odor, Ships, Pipelines, Water supply, Public utilities, Water consumption, Water distribution, Streams, Lakes, Federal government, State governments, Local governments, Project planning.
Identifiers: *Water Pollution Control Act, *Oil spills.

The problem of water supplies polluted by oil spills was studied by Committee 2500R of the American Water Works Association. The Committee report revealed extreme incidents of oil spills and considered measures currently underway to protect water supplies. Polluting oil most frequently results from faulty petroleum pipelines. The federal government now requires pipeline companies to report every such major accident. These reports indicate the causes of the problem and assess the damage. As a result of this analysis, government emergency teams are being established to deal with major spills into navigable waters. Federal, state, and local governments will participate in this program which is designed to warn water utilities of spills and prevent oil from reaching the raw water intakes. The Federal Water Pollution Control Act is being revised to deal more effectively with oil spills, especially those from offshore tankers. It also provides penalties for vessels discharging oil. The Committee report indicates that water utilities have handled the emergencies well and have prevented lengthy breakdowns of water production. The Committee further recommends the preparation of a manual for use by water utilities on how to deal with and prevent oil spill emergencies. (Dearing-Florida)

STATE ACTIVITIES,
Richard S. Nelle.
Am Water Works Ass'n J, Vol 53, No 6, p 857-861, July 1961, 5 p, 7 ref.

Descriptors: *Illinois, *Water pollution, *Water pollution control, *Pollution abatement, State governments, Local governments, Legislation, Water rights, Riparian rights, Natural use, Natural flow doctrine, Reasonable use, Artificial use, Riparian lands, Groundwater, Percolating water, Eminent domain, Public health, Domestic water, Industrial water, Recreation, Watershed management, Waste disposal, Planning, Inter-agency cooperation, Water quality control.

The common-law water rights doctrine has been interpreted in Illinois by the natural flow and reasonable use theories. Stream pollution control laws have adopted the reasonable use theory. In other considerations of water rights, the natural flow theory has prevailed in diversion questions whereas the reasonable use is more frequently applied in consumption problems. Because water pollution knows no political boundaries, development in this area must come from state governments. With an expanding industrial economy and a greater competition for water use, pollution control cannot be attained without control of use. Any use of water involves a change in water quality, and this quality needs to be managed with increased precision as the quantity of water diminishes. Although the control of pollution is administered at the state level, local governments must exercise the authority granted to them to plan, construct, and police water sources. Control of watershed pollution is a cooperative venture. Cooperation must exist between local and state governments and among state agencies. Specific interests on the local level and on the state level are discussed. (Schram-Florida)

DISCHARGING NOXIOUS MATTER INTO HIGHWAYS AND SURFACE WATERS.
Wis Stat Ann sec 146.13 (1957), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Water pollution, *Sewage, *Highways, Surface waters, Drainage water, Drains, Pipes, Septic tanks, Cesspools, Outlets, Sewers, Discharge, Ditches, Wells, Cities, Abatement, Legislation, Regulation, Control, Domestic wastes, Legal aspects, Administrative agencies.
Identifiers: *Penalties (Criminal), Pumpage, Noxious matter, Sanitary District Commission.

Discharge of noxious matter into public highways through drains, pipes, sewers, or other outlets is prohibited. Local boards of health, town sanitary commissions, or county boards of health may order the offender to remove the discharged matter within ten days, and if such condition continues or recurs, cause its removal themselves. The cost shall be charged to the offender either by direct charges or by a municipal tax lien on the offender's lands. Recovery of such costs from railroad lands and other lands not taxed in the usual manner shall be effected through the state treasury. Persons maintaining such nuisances are subject to fine and imprisonment. No person shall discharge in any manner untreated domestic sewage into surface waters nor shall he discharge effluents or pumpage from septic tanks, dry wells, or cesspools into surface waters. Persons committing such offenses are subject to fine and imprisonment. (Duss-Florida)
W70-02912

GENERAL MUNICIPALITY LAW DEALING WITH SEWERAGE SYSTEMS.

Wis Stat Ann secs 66.076-66.078 (1965).

Descriptors: *Wisconsin, *Sewage disposal, *Sewage treatment, *Treatment facilities, Disposal, Environmental sanitation, Sewers, Sewage, Local governments, Legislation, Legal aspects, Waste water treatment, Water utilization, Water rates, Domestic wastes, Municipal wastes, Cities, ydrants, Water works, Regulation, Public utilities.

Any city may construct, acquire, or lease any plant or equipment for the collection, disposal and treatment of sewage. Purchase of these facilities is to be financed through taxation or bond sales. Such bonds are not a general indebtedness of the municipality, but are secured only by the sewage facilities. (Barnett-Florida)
W70-02917

OPEN PIT MINING.
Pa Stat Ann tit 52, secs 1396.1, 1396.4 (1966).

Descriptors: *Pennsylvania, *Mine drainage, *Coal mining, *Water pollution sources, Mine wastes, Mine acids, Acid mine water, Coal mine wastes, Water pollution, Soil erosion, Backfill, Excavation, Drainage engineering, Ditches, Dikes, Legislation, Administrative agencies, Administrative decisions, Terracing, Soil conservation, Water conservation, Legal aspects, Surface drainage, Permits, Percolating water, Subsurface waters.

As an exercise of the police power, Pennsylvania regulates open pit mining to conserve and improve affected lands, protect wildlife, decrease soil erosion, and to aid in the prevention of the pollution of rivers and streams. In applying for a permit to mine coal, a detailed proposal showing the time, distance, and manner for backfilling must be included. Such proposal shall also show the manner in which the mine operator plans to divert surface water from draining into the pit. Terracing may be approved so long as no depressions exist to hold water which may percolate through the spoil and produce acid drainage. The operator shall be responsible for the prevention of stream pollution by acid drainage or avoidable siltation. Failure to adequately maintain such ditches, dikes, pumps, and drainage facilities as may be necessary to prevent water from accumulating in the pit, or to prevent stream pollution, or siltation shall render the operator liable to the sanctions and penalties of this act. The Department of Mines and Mineral Industries shall be the exclusive investigating, examining, reporting, and enforcement agent of the Sanitary Water Board in relation to this act. (Schram-Florida)

THE USE OF PURE OXYGEN IN RIVER AND IMPOUNDMENT AERATION,
New Mexico State Univ., Las Cruces.
R. E. Speece.
Pap, 24th Purdue Ind Waste Conf, May 1969. 22 p, 11 fig, 11 ref.

Descriptors: *Aeration, *Dissolved oxygen, *Oxygen, *Limnology, *Reaeration, Impoundments, Costs, Water quality, Rivers, Lakes, Reservoirs, Injection, Oxygenation, Bubbles, Hypolimnion, Sanitary engineering, Water pollution.
Identifiers: Oxygen exchange.

The application of a generalized finite-element method to the static and dynamic analysis of plate and shell structures is presented. The displacement formulation of the finite-element method is used. A particular form of generalized variational principle is used, admitting completely arbitrary displacement functions for an element. The form of the matrix equations is presented and the method of solution and the problem of dependent algebraic equations are discussed. Numerical results for a variety of polynomial displacement forms and continuity requirements are discussed. Limitations of the method are pointed out. (USBR)
W70-02955

INSECTICIDES AND ALGAE: TOXICITY AND DEGRADATION,
Ontario Water Resources Commission, Toronto. Div. of Research.
A. E. Christie.
Ontario Water Resources Commission, Div of Research Publication No 27, 1968. 26 p, 9 tab, 31 ref.

Descriptors: *Algae, *Algal control, *Algicides, Analytical techniques, Aquatic algae, Aquatic environment, Aquatic microbiology, Balance of nature, Bioassay, Chlorophyta, Environmental effects, Inhibition, Limnology, Pesticides, Pesticide removal, Pesticide residues, Physiological ecology, Phytoplankton, Phytotoxicity, Plankton, Pollutant identification, Sewage, Sewage disposal, Sewage lagoons, Sewage treatment, Stabilization ponds, Water pollution control, Water pollution effects, DDT.
Identifiers: Chlorella pyrenoidosa, Pesticide degradation, Sevin, Malathion, Acetone, Ethanol.

Relationships between three insecticides (DDT, Sevin and Malathion) and algae with respect to toxicity and degradation were investigated using materials obtained from a nearby waste stabilization pond and axenic cultures of Chlorella pyrenoidosa at pH 6.0 and 9.0. DDT exhibited no toxic properties to either system at concentrations up to 100 milligram/liter and was broken down only to a limited extent by algae. Malathion exhibited no persistent inhibitory effect to algae and appeared to be metabolized fairly readily in comparison to the other two insecticides studied. Sevin at 100 milligram/liter was more toxic to the mixed pond algae than to Chlorella. The toxicity of Sevin to Chlorella was more pronounced at pH 6 than at pH 9 (30 and 15% inhibition, respectively). The effect of Sevin could be detected at 0.1 milligram/liter, but increasing concentrats had little increased effectiveness. (Fitzgerald-Wisconsin)

STUDIES ON CHEMICALS WITH SELECTIVE TOXICITY TO BLUE-GREEN ALGAE,
Wisconsin Univ., Madison. Water Chemistry Lab.
George P. Fitzgerald, Gerald C. Gerloff, and Folke Skoog.
Sewage and Industrial Wastes, Vol 24, No 7, p 888-896, 1952. 1 fig, 6 tab, 7 ref.

Descriptors: *Toxicity, *Cyanophyta, *Chemcontrol, Eutrophication, Bass, Water pollution control, Minnows, Nuisance algae, Sunfishes, Algae, Daphnia, Lakes, Chlorophyta, Streams, Diatoms, Reservoirs, Cultures, Sewage effluents, Wisconsin, Algicides, Hydrolysis, Copper sulfate, Fishes, Herbicides, Midges, Pesticides.
Identifiers: *Selective toxicity, Chemical structure, 2,3-dichloronaphthoquinone, Microcystis aeruginosa, Aphanizomenon flos-aquae, Minimum lethal doses, Chu's media, Quinone derivatives, Alkyl substituted imidazolines, Biological activity, Quarternary, Ammonium compounds, Minimum lethal exposure, Phenanthroquinone, Madison (Wis), Elodea, Redox compounds, Ceratophyllum, Myrophyllum, Rhizoclonium, Photobiology.

Procedures used and results of toxicity tests of 300 organic chemicals to Microcystis aeruginosa, a bloom-producing cyanophyte (blue-green alga) are described. Many compounds were toxic in concentrations in the range 1-10 parts/millon (ppm); several quinone-like compounds are toxic below 1 ppm, and one, 2,3-dichloronapthoquinone, is lethal at concentrations of 0.002 ppm. Apparently selectively toxic to nuisance cyanophytes, it is nontoxic to most green algae and higher plants, and has no shortterm deleterious effects on some fishes and invertebrates even when present in excess of saturation concentrations. Further study of this compound to rule out injurious effects to desirable species after long exposures are recommended. Age of cultures of Microcystis influence its response to the compound; centrifuged cells from both 6-day and 19-day cultures were markedly less sensitive when resuspended in old medium. This effect was partially counteracted after fortification of old medium with nutrients. Estimates of minimum lethal exposures indicate that compound is effectively toxic after 8-10 minutes treatment of cells. Limited field tests in barrels, tanks, and lagoons, containing dense growths of nuisance algae, principally Aphanizomenon flos-aquae, in lake water or sewage effluent, indicate that compound is effective in low concentrations (0.01-0.1 ppm). POLLUTION ABATEMENT IN THE RUHR DISTRICT,
Harvard Univ., Cambridge, Mass.
G. W. Fair
In: Comparisons in Resource Management, Baltimore, Johns Hopkins Press, p 142-171, 1961. 30 p, 1 map, 6 tab, 17 ref, 1 append.

Descriptors: *Pollution abatement, *Transportation, *Industries, *Waste water, *Taxes, Potable water, River basin, Canals, Boats, Streams, Government, Swamps, Watercourses, Reservoirs, Floods, Marshes, Sewers.
Identifiers: *Emschergenossenschaft, *Ruhr district.

This article deals with pollution abatement measures in the six river-basin associations of the Ruhr district. Urban and economic development in the region is explained as it relates to intensified competition for water, making the development and safeguarding of surface sources of drinking water and process water a primary concern. One river-basin authority has acted, without change, for over fifty years. This is the Emschergenossenschaft, whose history is briefly related in this article. The river-basin associations have served autonomously, levying assessments and distributing benfits policies with the approval of both private and public representatives. These associations are unique in obtaining compliance with their prescriptions through thorough representation, and their power to plan, design, build and operate needed installations for pollution abatement. This article discusses a smoothly functioning and effective pollution abatement system that will be of interest to those working in water pollution problems. SUMMARY OF WATER QUALITY STANDARDS FOR THE INTERSTATE WATERS OF ARKANSAS.
Federal Water Pollution Control Administration, Washington, D.C.

Federal Water Pollution Control Administration-Arkansas Pollution Control Administration Cooperative Report, Oct 1969. 21 p, 1 fig, 2 tab.

Descriptors: *Water quality act, *Water quality, *Standards, *Arkansas, Legislation, Water pollution, Water pollution control, Sewage treatment, Interstate, Water utilization.
Identifiers: *Arkansas water quality standards.

Arkansas adopted standards for its interstate waters on May 26, 1967, which were then submitted to the Department of the Interior. Subsequently, certain revisions were made by the State in the original standards, and the Secretary of the Interior approved the standards, as revised, on August 7, 1967. At the request of the Secretary of the Interior, Arkansas adopted a policy to protect its high quality waters. The approved standards are thus both State and Federal Standards, enforceable under the Arkansas water pollution control statutes and the Federal Water Pollution Control Act, as amended (Section 10). The standards consist of three major components: designation of the uses which the waters are to serve, specification of narrative and numerical criteria to protect and enhance water quality, and specification of a plan of implementation and enforcement, which includes treatment and control requirements for municipal, industrial and other wastes discharged to or affecting the waters. ILLINOIS WATER POLLUTION AND WATER RESOURCES COMMISSION, REPORT AND RECOMMENDATIONS TO GOVERNOR RICHARD B. OGILVIE AND THE 76TH ILLINOIS GENERAL ASSEMBLY.
Illinois State Water Pollution and Water Resources Commission, Chicago.

State of Illinois Water Pollution and Water Resources Commission, Final Report, May 1969. 8 p, 1 fig.

Descriptors: *Illinois, *Water pollution, *Water resources, DDT, Chlorinated hydrocarbon pesticides, State governments, Water law, Legal aspects, Planning, Water resources development
Identifiers: *Illinois Water Pollution and Water Resources Commission.

Beginning with a history of the Commission, recommendations from two previous Commission Reports, the 1967 report and the 1968 special report on Lake Michigan, were reviewed. Recent activities of the Commission were summarized also. The report concluded with four major recommendations for the 76th General Assembly: (1) A natural resource, or a water resource development, or a pure waters bond act should again be passed to be placed before the people of Illinois; (2) An effective system of controls should be placed on the use of DDT and possibly on all chlorinated hydrocarbons that present a substantial danger to wildlife and possibly to human beings when in concentration; (3) A restructuring of State government should be placed in effect at the earliest possible time for greater effectiveness in administering, managing, and coordinating controls and assistance for water and other natural resources. Preferably a Department of Natural Resources should be created; and (4) Illinois water laws should be reviewed and combined in a Water Code. (Davis-Chicago)

COMBINED UNDERFLOW STORAGE PLAN FOR POLLUTION AND FLOOD CONTROL IN THE CHICAGO METROPOLITAN AREA,
Chicago Bureau of Engineering, Ill.
Clint J. Keifer, A. L. Tholin, and Marshall Suloway.
Chicago, City Bureau of Engineering, Department of Public Works, Sept 1969. 43 p, 13 fig, 6 tab.

Descriptors: *Underground storage, *Tunnels, *Control structures, *Sewers, *Flood control, *Water pollution control, Water conveyance, Waste water, Shafts, River regulation, Drainage systems, Drainage engineering, Design, Underflow.
Identifiers: *Chicago, *Metropolitan Sanitary District of Greater Chicago, Underflow storage plan.

Three alternative plans, proposed locally as solutions to flood control and pollution problems in the Chicago metropolitan area, are described and compared. The combined sewer systems, which carry the municipal and industrial wastes as well as storm water runoff, spill raw sewage into the Des Plaines, Chicago and Calumet Rivers and the Sanitary and Ship Canal from 400 outlets, during overflows occuring when interceptor sewers and treatment plants are loaded beyond capacity. The flow from these rivers empty via the Des Plaines River into the Illinois River. Intense rainstorms frequently

result in basement and underpass flooding. The $650 million plan suggested by the City proposes the construction of 95 miles of huge conveyance tunnels, 26 ft wide and 50 ft deep, excavated through solid rock beneath the Chicago, Calumet, and Des Plaines Rivers and the Sanitary and Ship Canal. Flows from the combined sewers would be dropped through shafts into these tunnels to provide temporary storage for flood prevention and to collect sewer overflows for subsequent pumping to three major existing treatment plants. Improvements along the Des Plaines River and the Sanitary and Ship Canals planned by the Illinois Division of Waterways are also described. The project design would be based upon handling the runoff from a storm with a 100 year average recurrence interval. (Poertner-Chicago)

PUBLIC HEALTH: DISPOSAL OF WASTE BY MUNICIPALITIES AND INDIVIDUALS THROUGH SEWAGE SYSTEMS.

Wis Stat Ann secs 144.05-144.07, 144.09, 144.10 (1957), as amended, (Supp 1969), 144.045, 144.14 (Supp 1969).

Descriptors: *Wisconsin, *Sewage disposal, *Sewage treatment, Administrative agencies, Water pollution, Watersheds, Cities, Streams, Lakes, Legal aspects, Treatment facilities, Conduits, Public health, Effluents, Refuse, Regulation, Drainage basins, Buildings, Sewerage, Sanitary engineering, Discharge, Legislation, Water treatment, Waste treatment, Water quality control.
Identifiers: *Enforcement, Penalties (Civil).

The outflow or effluent from sewage systems complying with section 144.04 may be discharged into any stream or drain constructed pursuant to law. No such outflow of untreated sewage may be discharged into lakes of a delineated size from a city in a county with a population of at least 240,000, any part of which is located within a drainage basin which drains within a minimum distance from the sewage systems. All necessary construction of plant facilities for the discharge of untreated sewage shall be completed by September 1, 1970. Advanced treatment of effluent may exempt owners of existing plants from these provisions. Municipalities with populations of more than 7,500 may require buildings used for human habitation to be connected with adjacent sewers or water mains. Penalties are provided for failure to comply. The Department of Resource Development may require the planning and construction of sewerage systems so that they may be connected. Adjacent municipalities may operate a joint system. Procedures for administering such a system are outlined. The Department of Resource Development is empowered to enforce its rules. Individual owners may secure a review of any order issued by the Department. (Duss-Florida)

WATER, ICE, SEWAGE AND REFUSE.

Wis Stat Ann secs 144.01-144.02, 144.04 (1957), as amended, (Supp 1969) 144.023-144.03 (Supp 1969).

Descriptors: *Wisconsin, *Water quality control, *Water pollution, *Sewage, Water supply, Water resources, Water quality act, Legislation, Water resources development, Water pollution control, Public health, Water treatment, State governments, Administration, Septic tanks, Sewage disposal, Sewage treatment.

The following terms are defined for purposes of this act: waters of the state, sewage, waterworks or water systems, water supply, sewerage systems, refuse, owner, industrial wastes, and pollution. The Department of Water Resources is authorized to act with the United States Geological Survey to determine the condition of polluted and unpolluted waters, the causes of pollution, including city sewage and industrial wastes, and the best sources of water supplies. Governmental owners must submit plans for sewerage systems to the Department of Water Resources for approval. A Department of Resource Development containing a Water Resources Division is created. The Department seeks to protect, maintain and improve the quality and management of the state's ground and surface waters. The purpose of this act is to centralize programs of water quality management in a single agency empowered to develop a comprehensive plan for protection of the public and private waters of the state. A State Water Resources Advisory advises the Department. The Department must divide the state into regions, each to be served by a regional director and regional advisory board. The installation of septic tanks is regulated. (Dye-Florida)
W70-03199

POLLUTION CONTROL: STANDARDS FOR SOLID WASTE DISPOSAL.
Wis Stat Ann secs 144.31, 144.43-144.46 (Supp 1969).

Descriptors: *Wisconsin, *Administrative agencies, *Solid wastes, *Waste disposal, Air pollution, Ultimate disposal, Water resources, Water management, Atmosphere, Industries, Standards, Construction, Flood plain zoning, Permits, Investigations, Landfill, State jurisdiction, Federal government, Shores, Research and development, Design, Treatment facilities, Pollutants, Regulation.

The Department of Resource Development shall have the power and duty to: promulgate rules; encourage local governments to handle local pollution problems; and organize a comprehensive program to improve and manage the state's air, land, and water resources. The Department may hold hearings, issue orders, secure necessary services, conduct investigations regarding emission from motor vehicles, and advise, consult, and cooperate with other appropriate governmental and private bodies. By January 1, 1969, the Department shall prepare and adopt minimum standards for the location, design, construction, sanitation, operation, and maintenance of solid waste disposal sites and facilities. Annual licensing of sites and facilities is required in order to secure compliance with these minimum standards. Local governments may apply more restrictive licensing standards. The Department may conduct research into matters concerning solid waste disposal. Unless authorized by the Department, solid waste disposal sites and facilities are prohibited within areas under the jurisdiction of shoreland and flood plain zoning regulations. (Duss-Florida)

CREATION OF TOWN SANITARY DISTRICTS FOR POLLUTION CONTROL AND WASTE DISPOSAL.
Wis Stat Ann secs 60.30-60.304 (1957), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Administrative agencies, *Drainage systems, *Waste disposal, Sewers, Sewage disposal, Sewage treatment, Drainage, Storm drains, Water works, Cities, Pumping, Construction, Jurisdiction, Real property, Public health, Legal aspects, Treatment facilities, Domestic wastes, Boundaries (Property), Sewage districts.
Identifiers: *Sanitary districts.

Town sanitary districts may be created for the purpose of purchasing, establishing, or constructing surface or storm water sewers, drainage improvements, sanitary sewers, or a system of waterworks, sewerage, or garbage disposal. The districts may sue and be sued in furtherance of these purposes. 'Sewerage' includes all construction for collection, transportation, pumping, treatment, and final disposition of sewage. Procedure for creation of a town sanitary district is set forth. Town districts may be created within metropolitan sewerage districts since it is the intention of the legislature to permit auxiliary sewer construction in addition to the main and intercepting sewers constructed by metropolitan districts. Town boards are vested with jurisdiction to establish town sanitary districts. Petitions requesting such districts must be submitted by a fixed percentage of affected landowners to the town boards. Open hearings must be held by the town board before the creation of a district can be approved. Judicial review of the board's action is made available. (Duss-Florida)

REGIONAL WATER AND SEWER DISTRICTS.

Ohio Rev Code Ann secs 6119.01, 6119.06 (Page 1953), as amended, (Supp 1970).

Descriptors: *Ohio, *Sewage districts, *Water supply, *Sewage disposal, Legislation, Legal aspects, Contracts, Leases, Regulation, Easements, Water purification, Sewage treatment, Construction, Maintenance, Operating costs, Drains, Dams, Reservoirs, Pumping plants, Cost allocation, Taxes, Assessments, Industrial wastes, Eminent domain, Canals, Compensation, Administrative agencies.

Specified areas may be organized as regional water and sewer districts for either or both of the following purposes: (1) to provide a water supply for domestic, industrial, and public use; or (2) to provide for the collection and disposal of sewage and other liquid wastes. Regional water and sewer districts are authorized to make regulations governing the control and operation of their services and facilities and to acquire or operate sewer systems, waterworks, filtration and purification plants, and sewage treatment plants. The districts may construct, acquire, and maintain drains, dams, sewers, reservoirs, holding basins, wells, intakes, pipelines, purification works, septic tanks, treatment and disposal works, and pumping stations. In addition, the districts have the following powers: to levy and collect taxes or special assessments; to deal in real or personal property and franchises to carry out the purposes of the district; to merge or combine with any other district to form a single district; to contract with any other political subdivision for the joint construction of any works they are authorized to construct; and to construct or alter any ditch, drain, or watercourse. 06. WATER RESOURCES PLANNING

6A. Techniques of Planning

OPERATIONS RESEARCH IN OUTDOOR RECREATION,
Battelle Memorial Inst., Columbus, Ohio.

Frank J. Cesario, Jr.
Journal of Leisure Research, Vol 1, p 33-51, Winter 1969. 19 p, 7 fig, 21 ref.

Descriptors: *Operations research, *Recreation, Population, Administration, Benefits, Highways, Regression analysis, Demand schedule, Supply, Demand.
Identifiers: Recreational travel flow, Recreation system, Population centers, Recreation sites, Gravity models, Linear systems analysis, Clawson-Knetsch technique.

A major concern of public administration is how to provide enough outdoor recreation services to satisfy the recreation-seeking public. Assuming that more recreation sites are to be provided, the problem becomes one of deciding what facilities to provide and where to locate them. To answer these questions rationally and to properly allocate the limited funds available, the economic benefits of various alternative projects need to be estimated. This problem can be studied by the methods of operations research. Work to date has shown an interesting dichotomy. Some analysts (mostly operations researchers) have been developing models to predict recreational travel flow. Other analysts (mostly economists) have been working on problems relating to the economic benefits of outdoor recreation developments. The purpose of this paper is threefold: first, the work of the two groups studying outdoor recreation is reviewed; second, it is shown that we cannot conveniently separate the estimation of benefits from the estimation of recreation travel flow, and third, some suggestions for new directions of research are given. The importance of water resources in outdoor recreation make this article of interest to the water planner. (Loeb-Rutgers)

A NOTE ON 'GRAPH-THEORETICAL APPROACHES TO THE THEORY OF SOCIAL CHOICE',
Resources Management Corp.
George M. Lady.
Public Choice, Vol 6, p 93-98, Spring 1969. 6 p, 4 ref.

Descriptors: Social aspects.
Identifiers: *Graph-theoretical approaches, *Social choice, Ranking, Intransitivity, Interpersonal comparisons, Quantitative problems.

The author discusses a method introduced by Professor M. Taylor for considering the problem of combining individual rankings. More specifically, Professor Taylor proposed an ingeneous application of graph theory to the problem of combining individual rankings into a group ranking. This note provides three classes of commentary. First, the analytical relationship between the structure of the individual rankings and the existence of intransitivity is somewhat consolidated. Second, certain quantitative difficulties are identified. Last, the problem of interpersonal comparison is reopened in the context of the computational scheme suggested by the paper. The author concludes that the graph theoretical approach is extremely useful although it does not entirely escape the problem of inter-personal comparisons. The problems of group decisions and interpersonal comparisons are present in water investment decisions and this article will be of interest to water researchers investigating decision processes and decision effects of water development projects. THE INVESTMENT DECISION UNDER UNCERTAINTY,
Donald Eugene Farrar.
Englewood Cliffs, New Jersey, Prentice-Hall, Inc., 1962. 90 p.

Descriptors: *Investment, *Risks, Decision making, Return
Identifiers: *Investment decision, Expected return, Certainty equivalence, Mathematical programming, Classical utility theory, Collinearity, Portfolios, Goodness of fit test, Capital theory.

Both the importance and the generality of uncertainty require that it be built into any theory that purports to explain a large portion of man's behavior. Economists have long been conscious of the need to more adequately account for its effect on such decision making units as the consumer and the firm. Capital theory, in particular, has felt the inadequacy of theories which ignore uncertainty's role in the investment decision. The author proposes to build a model so as to analyze decision making under uncertainty. This approach relies on only two substantive proposals: (1) an investor's utility of money function is positively sloped and concave downward, and (2) his investment strategy is the maximization of expected utility. The model is a direct descendant of classical utility theory. It can also be linked to the certainty equivalence tradition of risk aversion. Finally, it is also a mathematical programming approach to decision making under uncertainty. The model appears to describe the portfolio policies of mutual funds quite well. It is probable that with additional constraints, its applicability as a model of the investment decision under uncertainty may be quite general. If this is the case, such a model should prove quite useful in the water area where investment decisions are made with uncertainty and risk. (Loeb-Rutgers)

IMPORTANCE OF MATHEMATICAL METHOD AND COMPUTING TECHNIQUE APPLICATION TO WATER RESOURCE PLANNING AND CONTROL,
All-Union Research Inst. for Water Engineering and Reclamation, Moscow (USSR).
L. V. Dunin-Barcovsky.
The Use of Analog and Digital Computers in Hydrology, Vol 2, p 682-686, 1969. 5 p, 4 ref.

Descriptors: *Mathematical models, *Water resource development, *Optimization, *Planning, *Linear programming, Stochastic processes, Water works, Reservoirs, Multiple-purpose, River basins, Computers.
Identifiers: Operating schedules.

The development and use of linear and non-linear programming techniques and mathematical models for optimum planning and management of water resources in the USSR were discussed. The stochastic nature of the initial parameters of water works systems enabled the collection of reliable data about possible strategy and tactics for an optimum control which was necessary for the determination of optimum system parameter. The use of such characteristics as operating schedules for water reservoirs and water supply to consumers was an important element of optimum control. The optimization of operational systems was aimed at selecting optimum parameters and the operational system was used for modelling the operational process with the purpose of determining the optimization degree received. The management of the multiple-purpose Zeravshan river basin was given as an example. Computers were employed for data processing. (Thiuri-Cornell)

NEW METHODS FOR USING STOCHASTIC PROCEDURES IN WATER RESOURCE PLANNING,
Computer Technology, Inc., Arlington, Tex.
Jerry R. Rogers, and Ronald L. Boase.
Report to Tex Water Develop Board, Computer Technol Inc, Math-Sci Sect, Sept 1969. 45 p, 9 fig, 12 tab, 24 ref.

Descriptors: *Stochastic processes, *Synthetic hydrology, *Water resources development, *Planning, *Streamflow forcasting, *River basins, Hydrological data, Reservoir operation, Economics, Mathematical models.
Identifiers: Linear regression models.

Current stochastic models as well as a discussion on proper procedures for generating data for use in testing alternative plans for river basin improvement were presented. Existing data sources for Texas Water plan and their utilization in the stochastic models were reviewed. Linear regression models for relating the streamflow in one time period to a linear function of the flow in preceeding time period were compared. The Weibull distribution was considered as a possible candidate for filting hydrological data. To test the applicability of the Weibull distribution to meaningful data the historical flow rates for the Salt Fork branch of the Brazos River was selected. At least nine to ten random sets of 50 or 100 years of stochastic data would be applied to the Texas Water Plan reservoir-transmission analysis to provide; (a) experience on system economic and physical performance under a wide variety of potential streamflows and; (b) measures of the risks involved for various reservoir-transmission capacities and construction dates. MATHEMATICAL MODELS FOR OPTIMIZING THE ALLOCATION OF STORED WATER,
Nevada Univ., Reno. Center for Water Resources Research.
W. S. Butcher.
The Use of Analog and Digital Computers in Hydrology, UNESCO, Vol 2, p 714-723, 1969. 10 p, 23 ref.

Descriptors: *Mathematical models, *Optimization, *Resource allocation, *Linear programming, *Dynamic programming, Simulation analysis, Stochastic processes, River basins, Monte Carlo method, Hydrologic data, Hydro-electric power, Streamflow forecasting, Water storage.

The use of linear and dynamic programming techniques in various mathematical modeling methods capable of determining the optimal allocation of available water was discussed. To illustrate the alternative methods and their limitations, a river basin was examined. It was clear that if historical or known hydrological data was available, the optimum operation of a reservoir could be calculated directly by either linear or dynamic programming. However, if hydro-power was involved the linear programming formulation became clumsy and was not the best choice. Even without this, dynamic programming was to be preferred as it was simpler more direct and involved less computation. Dynamic programming under stochastic condition whether the Monte Carlo method or the true stochastic dynamic programming was superior to the alternatives available in streamflow determination and management. Simulation was essentially a 'what if' process, that is, for its use it was necessary to specify a proposed operating rule and see what happened if it was used. (Thiuri-Cornell)

ATLANTIC STATES MARINE FISHERIES COMMISSION.
Pa Stat Ann tit 30, secs 411-414, 417 (1958).

Descriptors: *Pennsylvania, *Interstate compacts, *Interstate commissions, *Marine fisheries, Water resources development, State governments, Administrative agencies, Cost allocation, Federal government, Political aspects, Leadership, Fish stocking, Legislation, Planning, Surveys, Investigations, Legal aspects, Research and development, Atlantic Coastal Plain, Fish conservation, Marine fish, Anadromous fish, Shellfish, Coordination.
Identifiers: Atlantic states.

The Governor of Pennsylvania is authorized to execute the Atlantic States Marine Fisheries Compact. The purpose of such compact is to promote the better utilization of the marine, shell, and anadromous fisheries of the Atlantic seaboard, by the development of a joint program for the promotion, protection, and prevention of physical waste of such fisheries. Each state joining shall appoint representatives to the Atlantic States Fisheries Commission which shall be constituted and organized as herein provided. The Commission shall have the powers and duties to: (1) conduct studies; (2) recommend coordination of the police powers of the several states; (3) recommend legislation; (4) advise state administrative agencies; and (5) recommend the stocking of waters. The states joining the Compact agree to make annual appropriation to the support of the Commission. The initial annual appropriation is set forth for each state. The Fish and Wildlife Service of the Department of the Interior of the United States shall act as the primary research agency of the Commission. Pennsylvania officers and bureaus are directed to cooperate with the Commission. (Marsee-Florida)

PLANS FOR MULTIPLE USE OF THE WATER RESOURCES IN THE LENA RIVER,
F. V. Iarosh.
Gidrotekh Stroit, No 1, p 1-8, 1966. Transl from Russ, Bur Reclam Transl 694, Oct 1969. 31 p, 5 fig, 5 tab.

Descriptors: Water resources, Project planning, Earth dams, Cold weather construction, *Multiple-purpose projects, Multiple use, Optimum development plans, Preliminary investigations, Foreign projects, *River basin development, Permafrost, Engineering geology, Dams, Hydroelectric plants, Feasibility studies, Hydroelectric power.
Identifiers: Comparative studies, Hydroelectric resources, Lena River Basin (USSR), Lower Lena Powerplant (USSR), Resources development.

The Lena River Basin, producing the second largest river discharge in Siberia, can provide the USSR with multiple benefits if properly developed for full use of the water resources for navigation, power, industry, mining, and forestry. Geography, climate, hydrology, and engineering geology of the Lena and 5 main tributaries, the Kirenga, Vitim, Olekma, Aldan, and Viliui Rivers, are described. A map of the river basin shows 60 hydropowerplant sites, including alternatives. The earth dam alternative at the Lower Lean site with backwater up to Iakutsk is discussed. The plan includes an earth dam, diversion canal, tunnel spillway, tunnel penstocks, and powerplant on the left bank with an installed capacity of 20,200 mw and annual output of 98.5 billion kwhr/yr. Power will be transmitted 3,500 km through the Central Siberian Grid to the Ural industrial area, although future planning will include cost comparison of constructing power-consuming industries near the powerplant. Construction will be difficult because of the remoteness of the area, lack of transportation facilities, severe arctic climate, permafrost, large flow and swift deep current through the Lean narrows, and magnitude of the construction work. (USBR)

WATER AS A RESOURCE AND AS A NUISANCE,
Geological Survey, Menlo Park, Calif.
Harold E. Thomas.
Highw Res Rec, No 271, p 17-28, 1969. 12 p, 17 ref.

Descriptors: *Water resources development, *Water, Water resources, Water utilization, Benefits, Hydrologic cycle, Damages, Bibliographies, Statistics, Urbanization, Rainfall effects, Minerals, Surface runoff, Land resources, Flood protection, Wastes, Atmospheric precipitation.
Identifiers: Urban hydrology.

Water as a resource is available for use and enjoyment by mankind. Consumptive uses reduce the quantity, and nonconsumptive uses may impair the quality of water available for use by others; various laws protect the respective rights of individuals in water use. Although water rights are protected as property rights, recognition of rights of the public and responsibilities of water users for maintenance of satisfactory quality are increasing. Water may constitute a nuisance if it harms development of land resources and invades recognized property rights. Conversely, development of land resources may have effects that interfere with the water rights of others, causing a nuisance. In urban areas, water as a resource becomes increasingly inadequate to meet requirements of the population and must be imported, along with food, fuel, and other materials. Generally in urban areas, water supply and disposal of used water have become public responsibilities. Urbanization changes the hydrology of an area in total runoff, peak flow characteristics, water quality, and appearance of lakes, streams, and valleys. To predict, ameliorate, or otherwise cope with these changes, urgent need exists for additional research in urban hydrology. (USBR)

ECONOMIC EVALUATION OF ENGINEERING PROJECTS,
Canada Ltd., Toronto (Ontario).
W. B. Magyar.
Engineering Economist, Vol 13, No 2, p 67-85, Winter 1968. 19 p, 4 charts, 20 ref.

Descriptors: *Environment, *Decision-making, *Engineering, *Design, Investment, Capital, Economic feasibility, Optimization, Economic evaluation, Computers, Research and development, Management, Budgets, Risks, Costs, Water consumption, Taxes.
Identifiers: *Stage-wise approach, Cash-flow analysis, Public works projects, Project business model.

The economic and technical feasibility of engineering projects was studied. Economic evaluation in such projects has been inadequate due largely to the absence of a good general framework for probing economic feasibility. Improvement and standardization of economic evaluation would help industry and government cope with proposed capital expenditures. Preliminary estimates for such expenditures should be an integral part of broad planning within the total environment involved. The recommended approach is therefore a general and stage-wise one which will furnish such information to improve decision-making. The time and costs involved in such extensive economic evaluations will be offset by savings from rejections of unsound programs. This method is especially applicable to water resource projects, due to the important role they play in the total environment quality. (Murphy-Rutgers)

ECONOMIC ANALYSIS OF PROJECTS FOR SECONDARY SOURCES OF WATER SUPPLY,
Ford, Bacon and Davis, Inc., New York.
John L. Rose.
Journal of American Water Works Association Vol 54, No 11, p 1361-1369, Nov 1962. 9 p.

Descriptors: *Investment, *Water supply, Economic analysis, Technology, Water resource development, Costs, Capital, Computers, Optimization, Demand, Interest rate, Discount rate, Engineering, Benefits.
Identifiers: *Staged construction, *Capacity.

This article discusses the factors entering into the economic analysis of projects for secondary water supplies and into the techniques for making the analysis. The factors discussed are: (1) the capacity of the proposed improvement, including the firming effect on the primary source of supply; (2) the conjectural nature of the demand projections; and (3) the susceptibility of alternative plans to staged construction. The choice of the formula to be used for deciding between the design alternatives is discussed as well as the rate of interest to be used to place events occurring at different times on a common basis. The author finds that the general tendency of the factors studied is to reduce the initial investment and to incur higher operating costs in the later stages of development. (Murphy-Rutgers)

ASSESSING THE DEMAND FOR OUTDOOR RECREATION,
George Washington Univ., Washington, D.C.
Jack L. Knetsch.
Journal of Leisure Research, Vol 1, No 1, p 85-87, Winter 1969. 3 p.

Descriptors: *Recreation demand, *Demand, *Recreation, Recreation facilities, Investment, Planning, Population, Prices, Supply.
Identifiers: Participation.

Due to increases in the use of recreation facilities, large investments are being made in this area and planning efforts are needed to improve the allocation of these investments. However, there is a lack of appropriate studies designed to guide these planning efforts. The author argues that outdoor recreation demand studies are often used in an inappropriate and incorrect manner. Problems are introduced by the methods which population data are employed. Recreation demand has often been used misleadingly due to the confusion of the recreation 'demand' terminology. Ambiguity enters principally at two points which make many so-called demand studies nearly useless as guides to planning recreation investment: The first is based on the premise that price-quantity relationships which lie behind the concepts of demand and supply should be ignored. A second difficulty is that so-called 'demand' is not demand at all. Often participation rates are influenced by both demand and availability of supply. The author argues that the single most serious and fundamental deficiency in demand surveys and studies is that they do not provide any means of determining how recreation use will respond to changes in supply. Recreation demand studies, to be useful for planning purposes must consider the effect of both demand and

supply factors on recreation use. The crucial role of water in outdoor recreation and the dollar benefits assigned to recreation in water projects make this article relevant to the water area. (Loeb-Rutgers)

A RESOURCE ECONOMIST VIEWS A NATURAL AREA,
Vermont Univ., Burlington.
Frederic O. Sargent.
Journal of Soil and Water Conservation, Vol 24, No 1, p 8-11, Jan-Feb 1969. 4 p.

Descriptors: *Resource allocation, Economic impact, Resource development, Decision making, Political aspects, Planning, Cost-benefit analysis, Economics.
Identifiers: *Resource economist, *Natural area, Free market, Economic principles, Economic methods, Opportunity costs, Resource development potential, Economic impact analysis.

Economists concern themselves with objective studies of costs, returns, benefits, allocation of cost, efficiency of resource use and resource distribution. All of these subjects have a bearing on decisions concerning natural resources. The author discusses the difference between resource economists and other economists. The difference hinges on the concept of the dominant resource allocating mechanism. Nonresource economists, be they specialized in production, marketing, business, investments, or other areas have one thing in common: They are all devoted to the proposition that the free market is the prime resource allocating mechanism in our society and that it handles the job of allocating resources well. The resource economist is devoted to the proposition that the political process in which government action at various levels controls, guides, and regulates the use of natural resources is the prime allocating procedure with respect to natural resources. The author continues by discussing how the resource economist views a natural area. He studies a natural area with reference to basic principles and by methods developed over a period of time that have been shown to be useful in making resource allocation decisions. These principles and methods are of two kinds, (1) planning and (2) economic principles and methods. (Loeb-Rutgers)

STRATEGIC INTERACTION AND RESOURCE ALLOCATION IN METROPOLITAN INTERGOVERNMENTAL RELATIONS,
Massachusetts Inst. of Tech., Cambridge.
Jerome Rothenberg.
AER, Vol 59, No 2, p 494-503, May 1969. 10 p.

Descriptors: *Resource allocation, *Governments, Sites, Cities, Costs, Welfare.
Identifiers: *Strategic interaction, Metropolitan area, Suburbs, Privacy, Locational advantages, Public policy, Land value, Variable sum strategic game, Residential location decisions.

The model presented in this paper concerns the influence that local government in a metropolitan area has on the distribution of economic activities within the area. The basic situation here is that a single metropolitan area government does not exist but a set of independent political jurisdictions is present. In this model the area is assumed to be partitioned into a central city jurisdiction and a single suburban jurisdiction, both of constant area. Certain policy instruments controlled by these jurisdictions are assumed to influence the location decisions of households and business. The model indicates how these instruments are used in a way to exert conflicting influences on such decisions such that the respective opposing pulls are akin to a process of strategic interplay between two players in a variable sum strategic game. As such, this paper might provide insights on the influential effect of government actions on water resource investment projects conducted on a regional or interlocality basis. (Loeb-Rutgers)

AN ECONOMIC THEORY OF SOCIAL MOVEMENTS,
London School of Economics and Political Science (England); and Johns Hopkins Univ., Baltimore, Md.
Albert Breton, and Raymond Breton.
AER, Vol 59, No 2, p 198-205, May 1969. 8 p, 1 fig.

Descriptors: *Economics, Demand, Supply, Environment, Growth rates.
Identifiers: *Social movement, Socioeconomic factors, Demand for social change, Supply of social movements.

Social movements do not make their appearance at random; instead they tend to emerge in relatively well-defined circumstances and to be accompanied by identifiable socioeconomic factors. In this paper the authors develop a hypothesis about the origin of social movement. The paper is divided into three parts: the first elaborates a theory of the demand for social change or, more specifically, a theory about why the demand for change manifests itself in social movements. This first part, in turn, is subdivided into two sections examining: first, some structural components of the environment in which social movements originate and, second, the definitions and assumptions of the proposed theory as well as its essential mechanisms. The second part introduces the concept of the supply of social movements and examines how this supply is related to the demand for social change. This discussion sheds some new light on the question of social change itself. Social change and its political effects can have significant implications for the public goods area. Water resource development involves all the problems of the public sector and this article may be of general relevance to relating social and institutional factors into studies of water resources. (Loeb-Rutgers)

ECONOMIC CONSIDERATIONS FOR THE DESIGN OF WATER INSTITUTIONS,
Indiana Univ., Bloomington.
Jerome W. Milliman.
Public Administration Review, Vol 25, No 4, p 284-289, Dec 1965. 6 p.

Descriptors: *Economics, Administration, Institutions, Water allocation, Water management, Water resources development, Water law.
Identifiers: *Water institutions, Regional economic growth, Water crisis, Public agencies, Efficiency.

The problem of how best to allocate water resources should be viewed as part of an overall management problem in the use and development of water resources and not simply as a problem of allocation of water resources among competing uses. The problem of allocation needs is to be considered within a management framework which is capable of comprehending the major technological, hydrologic and economic relationships of water resource management. The allocation of water resources involves wise choice in all the uses of water and also efficient use of all complementary resources intimately related to water resource development and regional economic growth. Our water problems are largely ones of inadequate institutional arrangements for management of water resources and failure to use economic principles. Two alternatives are suggested for consideration in the choice of decision-making frameworks, the regional basin authority and greater use of the market system through improvement in water law. The author suggests that some combination of the two would be desirable and feasible for greatly improving the management of our water resources. (Loeb-Rutgers)

THE USES OF ECONOMIC RESEARCH,
National Bureau of Economic Research, New York.
Solomon Fabricant.
43rd Annual Report, National Bureau of Economic Research, NY, p 1-4, May 1963. 4 p.

Descriptors: *Economics, *Forecasting, Economic analysis, Measurement, Government, Taxes, Economic investigations, Social impact.
Identifiers: *Economic research, *Economic concepts, *Quantification, *Economic behavior, *Research aims, Economic policy.

Economic research is aimed at strengthening the ability of economics to better human life. Knowledge for its own sake is not the main objective of economic research. It should aim at: clarifying the concepts and terminology used in discussing economic problems; devising measurements that permit objective assessment of significant economic quantities; compiling significant information on economic facts; observing and explaining economic behavior; drawing implications of changes of structure in our economy; aid in forecasting and estimating the probable consequences of policies. Due to the importance of economic research in much of the water resource area, this general discussion of the purposes of research should be of interest to the water researcher. (Murphy-Rutgers)

UTAH'S FUTURE WATER PROBLEMS,
Wayne D. Criddle.
Utah, Utah State University, 1958. 19 p.

Descriptors: *Utah, Urbanization, Legal aspects, Social aspects, Water law, Water supply, Soils, Irrigation, Drainage, Water utilization, Water resources development.
Identifiers: *Water problems, Technical problems, Instruments, Water research.

Utah is rapidly changing from what was once predominately an agricultural state to an urban and industrial state. This shift is intensifying the water needs of the state and creating many new problems. These changes involve technical, legal, sociological and economic problems never before encountered. Before attempting to look at Utah's water problems of the future, the author reviews the developments that have taken place in the past. The author then discusses the areas of water laws, limited technical knowledge of water supply, knowledge of soils, irrigation facilities, water uses and research in water use and development. ADMINISTRATIVE DECISION MAKING,
Carnegie Inst. of Tech., Pittsburgh, Pa.
Herbert A. Simon.
Public Administrative Review, Vol 25, No 1, p 31-37, Mar 1965. 7 p.

Descriptors: *Decision making, Administrative decisions, Administration, Operations research.
Identifiers: *Administrative decision making, Management science, Optimality, Persuasion, Evocation.

Decision-making concepts and language have become highly popular in papers concerning administration. This paper describes some of the progress that has been made over the past quarter century employing this approach towards furthering the scientific knowledge of what new facts have been learned about human behavior in organizations, what new scientific procedures have been developed for ascertaining facts, what new concepts have been made for describing and explaining these facts. This progress extends both to descriptive and normative matters: to the pure science of administration, and its application to the practical business of managing. As such, this article may present insights in administrative decision making applicable to the water area. (Loeb-Rutgers)

TECHNOLOGY IN AMERICAN WATER DEVELOPMENT,
Edward A. Ackerman, and George O. G. Lof.
Baltimore, Maryland, The Johns Hopkins Press, 1959. 710 p.

Descriptors: *Technology, *Water resources development, Administration, Political aspects, Water utilization, Water demand, Water supply, Water quality, Transportation, Irrigation, Water control, Groundwater, Sea water, Runoff, Flood control.
Identifiers: Public administration, Geographical aspects, Water quantity, Recycling, Administrative organization.

This volume is an exploratory study with the objectives of: (1) providing a review of the past technical changes important in water development, and the construction of a meaningful classification of such technical events; (2) an appraisal of the socially and economically relevant technical subjects suitable for more detailed study; and (3) an appraisal of the manner of studying the relation between technology and administration of water development in the United States. The greater part of the study treats the proven technology which has influenced water development in the past or which still is effective in shaping its course. However, the study also treats the newer technology. This may have only modest immediate significance, but its potential importance is large. What this emerging technology may mean in terms of the evolving technological structure of water development in the United States is considered in the last chapter of this study. (Loeb-Rutgers)
W70-03008

NATURAL RESOURCES FOR U S GROWTH,
Resources for the Future, Inc., Washington, D.C.
Hans H. Landsberg.
Baltimore, Maryland, The Johns Hopkins Press, 1964. 260 p.

Descriptors: *Natural resources, *Water supply, Water uses, Withdrawal, Income, Water demand, Irrigation, Technology, Water quality, Dissolved oxygen, Regional analysis, Agriculture, Gross National Product, Construction, Transportation, Demand.
Identifiers: *Future requirements, *Resource adequacy, On-site uses.

This is an examination of the adequacy of natural resources in the United States over the rest of the century. The broad prospects for the economy as a whole are discussed with projections made of GNP, various types of spending, and the expected advances in technology. Future requirements for living are considered as well as what they appear to mean in terms of needs for the various natural resources and their products. The availability of resources to meet these projected requirements is considered. Although much of the discussion is applicable to water resources there is a substantial section devoted specifically to water. The unique characteristics of water use and problems are considered along with demand indicators, depletion for specific withdrawal and nonwithdrawal uses, the requirements for water quality, as well as the characteristics and adequacy of future water supply. In the last section some of the chief policy issues suggested are reviewed. (Murphy-Rutgers)

THE SOCIAL SCIENCES AND AMERICAN CIVILIZATION,
Bruce Watson, and William Tarr.
New York, John Wiley and Sons, Inc, 1964. 584 p.

Descriptors: *Institutions, Political aspects, Economics, Community development, Schools, Military aspects, Gross national product, Income, Resource allocation, Management.
Identifiers: *Social sciences, *American civilization, *Socialization, *Economic institutions, *Political institutions, Personality, Human group, Urban society, Traditional society family, Church, Capitalism, Economic roles, Democracy, Classical view, Income distribution, Economic revisionist, Entrepreneur, Consumption.

The point of view found in this book is based on the interrelatedness of knowledge in the social sciences. The authors have selected some of the major themes and concepts from the behavioral sciences and have applied these to various trends and institutions of American civilization. The study of American trends and institutions has been placed in a historical context as an aid to the application of concepts. For example, in the study of economic institutions the historical development of capitalism as a form of social organization and as an ideology are discussed before the strictly behavioral subject matter. The concepts introduced throughout the book are illustrated and elaborated by the frequent inclusion of the works of other authors. Part one of the book is devoted to four tools of analysis which form the analytic basis of the list. Part two deals with the nature of the human community; Part Three and Four with the socialization process; Part Five with the economic institution; Part Six with political institutions, and Part Seven with certain unsolved problems in American civilization. This volume provides the water manager and water researcher with a broad picture of the institutions within which social decisions are made as well as specifically reviewing some of the trends in economics and management. (Loeb-Rutgers)

PUBLIC INVESTMENT CRITERIA,
Massachusetts Inst. of Tech., Cambridge.
Stephen A. Marglin.
Cambridge, Massachusetts, The MIT Press, 1967. 103 p.

Descriptors: *Cost-benefit analysis, *Investment, *Government, Economics, Capital, Discount rate, Economic efficiency, Pricing, Costs, Regional analysis, Indirect benefits, Budgeting, Dynamics, Economic evaluation.
Identifiers: *Public investment, *Intertemporal criteria, *Investment objectives, Redistribution, Willingness-to-pay, Merit-want, Investment timing.

This book explores some of the theoretical problems of subjecting public investment decisions to cost-benefit analysis. A short history of cost-benefit analysis is presented, followed by an analysis of the objectives relevant to investment planning, along with the methods of specifying their relative importance. The different types of possible benefits and their relation to objectives as well as costs are discussed. The fact that the meaning of benefits and costs varies from objective to objective is stressed. The choice of an intertemporal criterion receives significant space and the author proposes weights be imposed on each contribution to each objective in each time period. The role of uncertainty is evaluated as well as the effects of secondary benefits and private alternatives to public investment. A brief discussion of the applicable principles of pricing concludes the book. Both the large role of government and the increased use of cost-benefit analysis in water resources make this book useful to the water researcher. (Murphy-Rutgers)

THE BENEFITS FROM WATERSHED DEVELOPMENT,
Soil Conservation Service, Washington, D.C.; Tennessee Valley Authority, Knoxville; and North Carolina State Univ., Raleigh.
Erwin C. Ford, Elco L. Greenshields, and Fletcher E. Riggs.
In: Economics of Watershed Planning, p 27-41, Iowa State University Press, Ames, 1961. 15 p, 1 fig, 2 tab.

Descriptors: *Benefits, Geographical regions, Planning, Water management, Municipal water, Industrial water, Drainage, Irrigation, Recreation, Wildlife, Competition.
Identifiers: Watershed development, Complementarity, Public Law 566, Watershed projects, Wildlife benefits, Flood prevention.

This paper attempts to give perspective to benefit issues confronting planners. It concentrates on physical and economic factors conducive to different kinds of benefits. It also considers whether, in securing one type of benefit, the expense of securing other benefits is affected or, in other words, whether complementarity or competitiveness exists between benefits. This chapter is based partly on benefit estimates taken from Public Law 566 watershed work-plans. For classifying the projects, the country was divided into 13 regions. The regional breakdown conforms to physiographic and economic characteristics. It has been designed to contain the minimum number of regions necessary for reasonable homogeneous groupings of projects. The first part of the chapter describes the benefits with which the small watershed program is concerned under Public Law 566 and related laws. Results from project plans through time and by regions are presented. The second part concerns some hypotheses to explain geographic distribution of benefits. Finally, issues surrounding benefits in the planning process are considered. (See Vol 2, No 14, Field 6B, entry W69-05718). (Loeb-Rutgers)

APPLYING ECONOMIC PRINCIPLES IN WATERSHED PLANNING,
Department of Agriculture, Washington, D.C.
George A. Pavelis.
In: Economics of Watershed Planning, p 151-164, Iowa State University Press, Ames, 1961. 14 p, 2 fig, 3 tab.

Descriptors: Economics, *Welfare resource allocation, Cost-benefit analysis, Benefits, Costs, Linear programming, *Watersheds.
Identifiers: *Watershed planning, *Nepper watershed.

Watershed development can be viewed as a welfare-oriented economic reorganization in which welfare may be increased by two means: (1) a more efficient allocation of resources currently available to the reorganizing participants, and (2) an efficient allocation of additional resources made available for development purposes. According to modern welfare theory, welfare in the aggregate can be increased only to the extent the welfare of any individual participant would not be decreased by reason of watershed programs being carried out. The crux of watershed planning may be viewed as finding the adjustments in resource use required to increase welfare as much as possible. The resource adjustments are reflected by changed systems of land use or by the installation of water control structures. These are referred to, respectively, as land treatment measures and structural measures. The planning framework used in the Nepper watershed is presented which shows how to combine measures so as to achieve maximum net benefits, subject to any specified restriction. Linear programming was illustrated as a useful supplement to conventional benefit-cost analysis for solving comprehensive watershed planning problems on a multipurpose basis. (See Vol 2, No 14, Field 6B, entry W69-05718). (Loeb-Rutgers)

ORGANIZATION FOR WATERSHED PLANNING IN THE PUBLIC INTEREST,
Tennessee Valley Authority, Knoxville.
Robert E. Lowry.
In: Economics of Watershed Planning, p 246-259, Iowa State University Press, Ames, 1961. 14 p.

Descriptors: Water resources, Flood control, *Water management, Economics, Planning, Cost sharing, *River basin development.
Identifiers: *Watershed planning, *Public interest.

Three issues of watershed planning are considered. The first states that the organization of the national watershed program according to local units, with the transient characteristics inherent in the project approach, tends to remove watershed development

from the normal channels through which most public services are administered and financed. The result is that this activity is an appendage to public policy rather than an integral part of it. The second issue raised is that separate economic justification of watershed projects impairs opportunity to view in wider perspective the contribution watershed planning can make to water management and economic development for nation and region. A third concern is what might be done organizationally to establish watershed planning and development more firmly as a national program within a framework of federal and state policy. (See Vol 2, No 14, Field 6B, entry W69-05718). (Loeb-Rutgers)

MULTIPLE PURPOSE LAND AND WATER DISTRICTS IN ONTARIO,
University of Western Ontario, London.
E. G. Pleva.
In: Comparisons in Resource Management, Baltimore, Johns Hoptkins Press, p 189-207, 1961. 19 p, 2 map.

Descriptors: *Watersheds, *Conservation, *Research and development, Water supply, Recreation, Flood control, Ponds, Drainage basin, Lakes, Rivers, Dams, Reservoirs, Streams, Fish, Managment.
Identifiers: *Ontario, *Conservation Authorities Act, Hydrometric records, Meteorogical records, Municipalities.

This article deals with the distinctive multiple purpose land and water resources district of Ontario as a device for carrying out a coherent set of programs drawing on several governmental departments. The operation of these districts dates from the 1964 Conservation Authorities Act, which permits local government to organize as an authority for purposes of flood control, fish and wildlife management, and any other scheme related to the conservation of natural resources within a drainage basin. In the case of water, hydrometric and meteorological records of the watershed are studied, as are flood records, reservoirs, lakes, ponds, and dams. After such study, assistance is requested by the Authority, from the government. Such aid may be economic or technical, but must be requested as a control measure on the Authority. The public is consulted, and a timetable of projects is presented, allowing for long-range modification as research and practice develop the plan. (See Vol 2, No 24, Field 6B, entry W69-09952). ORGANIZATIONAL ADAPTATION TO CHANGE IN PUBLIC OBJECTIVES,
Colorado State Univ., Fort Colling. Dept. of Political Science.
D. Hill, P. O. Foss, and R. L. Meek.
Partial Completion Report, Colorado Natural Resources Center, June 30, 1969. 40 p, 24 tab, 1 fig. OWRR Project A-005-COLO.

Descriptors: *Organization adaptation, *Public objectives, *Water planning.

A case study of the Poudre River system in Colorado shows that generally, the organization for water distribution has maintained consistency of value perspective but have adopted their organizations forms, patterns of behavior, and communication linkages, to the requirements of changing system parameters. The development of the Poudre River Water Users Association is illustrative of a pattern of institutional innovation and cooperative activity by the organizations to maintain effective influence in a changing environment. There is an indication of intensification of demands by local water officials for a greater voice in the system. Given the patterns of perception by all actors in the system of the awareness, interest, and understanding of water matters by local water officials, it seems clear that the system will increasingly adapt to the values and objectives represented by these officials.

STATE ORGANIZATIONS FOR WATER RESOURCES PLANNING,
Daniel H. Hoggan.
Am Water Wks Ass'n J, vol 61, no 12, p 667-674, Dec 1969. 8 p, 1 ref.

Descriptors: *Water resources development, *Planning, *State governments, *Administrative agencies, River basin development, Federal project policy, Federal government, Administration, Conservation, Interstate commissions, Political aspects, Universities, Inter-agency cooperation, Wildlife conservation, Parks, Recreation, Financing, Legislation, California, New York, Minnesota, Texas, Utah.
Identifiers: *United States Water Resources Council.

A study was made of five state water planning agencies to determine the most efficient organizational structure for water resources planning and administration. This study analyzed the California Department of Water Resources, Minnesota State Planning Agency, New York Resources Water Commission, Texas Water Development Board, and the Utah Division of Water Resources. The study resulted in several recommendations as to the organization of a model water resources agency. Water resources development can best be managed by one state executive agency under a single chief executive. Related conservation areas such as wildlife, parks, and recreation should be combined under the same agency as water resources planning. The agency staff should be made up of specialists and be adequately equipped and financed. Special efforts should be made to coordinate executive and legislative programs. The expertise and research facilities of universities should be utilized. Requests of special interest groups should be considered in defining policy. The state should coordinate its water planning with the federal agencies, other states' agencies, and local organizations. Further recommendations are made as to the ideal structure of the agency staff. (Dearing-Fla)

ECONOMIC MEASURE OF EFFECT OF EXTREME DATA,
Harvard Univ., Cambridge, Mass. Dept. of Engineering and Applied Physics.
Myron B. Fiering.
ASCE Proceedings, Journal of Sanitary Engineering Division, Vol 95, No SA4, Paper 6720, p 683-698, Aug 1969. 16 p, 8 fig, 6 tab, 6 ref.

Descriptors: *Data collections, *Sampling, *Statistical methods, *Cost-benefit analysis, Hydrograph analysis, Duration curves, Streamflow forecasting, Stochastic processes, Water yield, Water storage, Reservoir operation, Reservoir design, Water management (Applied).
Identifiers: *Extreme data analysis.

Hydrologic and sanitary engineers collect flow data with religious zeal, and practically no project is designed without a plaintive appeal for more data. Data collection agencies are concerned about the propriety, validity and utility of collecting more data everywhere, and have mounted systematic analyses of the cost and benefit associated with more observations. Techniques for evaluating the economic significance of extreme data are suggested; general guidelines, for selecting among competing design models which purport to be adequate to the task, are offered. Simulation and streamflow synthesis are used to derive performance indices from which conclusions can be reached in particular cases. The study does not make specific design recommendations. THE DISCOUNT RATE IN PUBLIC INVESTMENT EVALUATION.
Western Agricultural Economics Research Council, Denver, Colo.

Delworth B. Gardner, and Robert A. Young, Co-chairmen. Conference Proceedings, Committee on the Economics of Water Resources Development, Denver, Colo, Dec 17-18, 1968. 106 p, 23 tab, 2 fig, 9 articles.

Descriptors: *Discount rate, Evaluation.
Identifiers: *Public investment, *Social discount rate.

Discounting makes revenues and costs occuring in different planning intervals comparable in time. The explicit discount rate chosen will affect investment decisions in public and private resources. The publication is divided into two parts: The views from the Academy, and a panel discussion giving the views from the Federal Government. Four articles comprise the first part: On measuring the social opportunity cost of public funds; measuring the opportunity cost of private investment; the opportunity cost of displaced private spending and the social discount rate; and the discount rate in public investment evaluation. The second part is comprised of five statements by members of the Federal Government. (See also W70-03155 thru W70-03158). (Grossman-Rutgers)
W70-03154

ON MEASURING THE SOCIAL OPPORTUNITY COST OF PUBLIC FUNDS,
Chicago Univ., Ill.
Arnold C. Harberger.
Conf Proc, Comm on the Econ of Water Resources Develop, Denver, Colo, p 1-24, Dec 17-18, 1968. 24 p, 1 fig, 1 append, 4 ref.

Descriptors: *Discount rate, Interest rate, Time investment.
Identifiers: *Social discount rate, Opportunity costs.

In the basic model it is assumed that the social rate of time preference refers to an appropriately weighted average of the different marginal rates of time preference applicable to the individuals who compose society. A simple analytical framework which is sufficiently general to yield the market rate of interest, the private-sector marginal productivity of capital, and the social rate of time

preference as the appropriate rate of discount under special circumstances, is presented. The solution that emerges in the general case is equal to a weighted average of the last two or to the market interest rate adjusted for distortions in the capital market. An alternative formulation of the social opportunity cost of capital takes into account the external effects of Government borrowing. The implications of the analysis are discussed. (See W70-03154). (Grossman-Rutgers)

MEASURING THE OPPPRTUNITY COST OF PRIVATE INVESTMENT,
Institute for Defense Analyses, Arlington, Va.
J. A. Stockfisch.
Conf Proc, Comm on the Econ of Water Resources Develop, Denver, Colo, p 25-49, Dec 17-18, 1968. 25 p, 14 tab, 1 append, 9 ref.

Descriptors: *Discount rate, Interest rate, Investment, Inflation (Economic).
Identifiers: *Social discount rate, Opportunity costs.

The discount rate used to evaluate government programs should reflect the opportunity cost of private investment. The appropriate methodology to measure the opportunity cost of private investment is developed. What is needed is a measure of the marginal efficiency of private investment. Part I of the paper shows why yields of claims are inadequate measures of the opportunity cost of capital. A methodology is developed to measure the rate of return which utilizes the asset approach. Part II of the paper actually measures the rate of return. Part III of the paper presents a note on adjusting an empirically estimated or revealed rate of return for inflation. (See W70-03154). (Grossman-Rutgers)
W70-03156

THE OPPORTUNITY COST OF DISPLACED PRIVATE SPENDING AND THE SOCIAL DISCOUNT RATE,
Joint Committee on Economics (U.S. Congress).
Robert H. Haveman.
Conf Proc, Comm on the Econ of the Water Resources Develop, Denver, Colo, p 51-69, Dec 17-18, 1968. 19 p, 6 tab, 13 ref.

Descriptors: *Discount rate, *Investment, Interest rate.
Identifiers: *Social discount rate, *Opportunity costs.

This paper outlines the major contending arguments in the debate on the social discount rate concept and its empirical estimation: The social time preference position; the opportunity cost position, and the preferred opportunity cost position. Finally, an empirical estimate is made of the opportunity cost of displaced private spending using the empirical framework implicit in the preferred social interest position. This calculation is a grand-weighted-average of the opportunity costs of marginal public spending displaced by taxes. This position is the opportunity cost of public investments financed by the personal income tax. (See W70-03154). (Grossman-Rutgers)
W70-03157

THE DISCOUNT RATE IN PUBLIC INVESTMENT EVALUATION,
Howard Univ., Washington, D.C.
Stephen A. Marglin.
Conf Proc, Comm on the Econ of Water Resources Develop, Denver, Colo, p 71-82, Dec 17-18, 1968. 12 p, 16 ref.

Descriptors: *Discount rate, Interest rate, Investment, Competition.
Identifiers: *Social discount rate, Opportunity costs.

The case of perfect competition and Pareto optimality is examined. Such conditions lead to a market rate of interest is equal to the amount by which both the marginal rate of substitution of future for present consumption and the marginal rate of transformation between future and present consumption exceed unity. The following difficulties in the the theoretical identification of competitive equalibrium are examined: The open-endedness of the future, uncertainty, externalities (including public goods), increasing returns, risk-aversion, and income distribution. A discussion of the social rate of discount based on capital productivity (marginal rate of transformation) follows; last is a discussion of the social rate of discount based on the marginal rates of substitution. (See W70-03154). (Grossman-Rutgers)

A MULTIAGENCY DECISION MODEL FRAMEWORK FOR BENEFIT-COST ANALYSIS,
Waterloo Univ. (Ontario). Dept. of Management Sciences.
Donald J. Clough.
Canadian Oper Res Soc, Vol 7, No 3, p 193-203, Nov 1969. 11 p, 1 fig, 35 ref.

Descriptors: *Decision making, *Cost-benefit analysis, *Public benefits, *Water resource development, *Planning, Optimization, Joint cost, Professional societies, Political constraints.

The porblems of benefit-cost analysis of public works projects that arise when many different agencies enter into the decision-making process were discussed. Water resource planning projects in the Province of Ontario were discussed as examples in which government departments, political representatives, professional associations private groups, and public organizations directly or indirectly specified objectives and constraints. It was indicated that in principle each agency could have its own optimality criterion. However in the end, a decision to select a unique plan for implementation was usually based on political bargaining. If it turned out that all agencies selected the same optimal plan, the political problems were reduced. The bargaining processes in reaching agreement on a single plan on the basis of joint criterion function were not well understood or modelled. (Thiuri-Cornell)

OHIO WATER COMMISSION.

Ohio Rev Code Ann secs 1525.01 thru 1525.04 (Page 1964), as amended, (Supp 1970), secs 1525.05, 1525.06, 1525.11 thru 1525.13 (Page Supp 1970).

Descriptors: *Ohio, *Water resources, *Water supply, *Flood control, Legislation, Legal aspects, Surface waters, Subsurface waters, Aquifers, Water utilization, Watersheds (Basins), Beneficial use, Hydroelectric power, Regulation, Administrative agencies, Water conservation, Water management (Applied), Data collections, Watercourses (Legal), Planning, Financing, Water quality, Water pollution, Bodies of water.

'Water resources' means all surface waters and all subsurface waters which are available or may be made available to agricultural, industrial, public, commercial, recreational and domestic users. 'Beneficial use' means a use of water that is reasonable and consistent with the public interest in the proper utilization of water resources. 'Water management' means planning, financing, or operating water improvements and programs. A Water Commission is created within the Department of Natural Resources to carry out the purposes of this section. In order to coordinate the water programs of the state, to develop water supply and flood control, and to obtain the most beneficial use of water resources, the Commission is authorized to: (1) recommend water development plans; (2) recommend water policy and legislation; (3) encourage the development of water resources; and (4) acquire and disperse hydrologic data. The factors which the Commission will consider prior to recommending loans for water management purposes are enumerated. The Commission will certify proposed water quality standards. The Water and Sewer Rotary Commission is created to handle applications for state funds to meet the cost of extending water and sewer lines for industrial purposes. (Keith-Florida)

OPPORTUNITY COST CALCULATIONS IN COST-BENEFIT ANALYSIS,
Nuffield Coll., Oxford (England).
Martin S. Feldstein.
Public Finance, Vol XIX, No 2, p 117-139, 1964. 23 p.

Descriptors: *Cost-benefit analysis, *Economic evaluation, *Investment, Financing, Value, Interest rate, Benefits, Capital, Debt, Taxes, Costs, Optimization, Budgeting.
Identifiers: *Public investment, *Opportunity costs, *S.O.C., *S.T.P., Rate of return, Social productivity, Target rates, Payback.

The social opportunity cost (SOC) of a public investment project is the value to society of the best alternative use to which the resources could have been put the SOC rates that have been suggested by others as measures of the opportunity cost of funds transferred from the private sector are inappropriate. An SOC rate can only be used as a measure of the social productivity of a private investment. The author shows that the SOC of funds transferred from other agency projects because of capital rationing cannot be evaluated by previously proposed methods. He also demonstrates that evaluating public investment projects in a mixed economy requires separate treatment of social time preference (STP) and SOC rates and that previously advocated methods for combining STP and SOC are inappropriate. Both the extent of government investment in water resource development and the wide-spread use of cost-benefit analysis, make this article useful to the water researcher. (Murphy-Rutgers)

SECOND-BEST RULES FOR PUBLIC ENTERPRISE PRICING,
Queen Mary Coll., London (England).
R. Rees.
Economica, Vol 35, No 139, p 260-273, Aug 1968. 14 p, 11 ref.

Descriptors: *Pricing, *Marginal costs, *Welfare, Prices, Efficiencies, Constraints, Monopoly, Taxes.
Identifiers: *Second-best, *Public enterprise pricing, Marginal cost pricing, Public sector, Private sector, Subsidies.

The case for marginal cost pricing by a public enterprise requires that prices equal marginal costs in the rest of the economy and it assumes that any resulting profit or loss is acceptable. In fact, the

requirement is not met and the assumption is invalid. There is often a close relationship between a public enterprise and private industries which do not sell at marginal cost. The basic principle is that public enterprise prices should be set so as to maximize welfare and achieve allocative efficiency. Any pricing rule which purports to be optimal in this sense and which is seriously proposed as a practicable basis for pricing must take into account the constraints which are likely to exist. These will in general involve departures from the conditions under which marginal cost pricing rules are derived and so we are in the domain of the 'second best.' Using some recent developments in the theory of the second best, the author attempts to examine the implications of the welfare maximization criterion when financial targets in the public sector and price/marginal-cost divergences in the private sector are taken into account. The constraint of the availability of information on which to calculate prices, and the costs of this information are ignored. Pricing policies for water supply involve questions of second-best solutions and this article may be relevant to the theoretical pricing problems of water. (Loeb-Rutgers)
W70-02988

TWO PROPOSITIONS ON THE OPTIMUM LEVEL OF PRODUCING COLLECTIVE GOODS,
Washington Univ., Seattle.
Yoram Barzel.
Public Choice, Vol 6, p 31-37, Spring 1969. 7 p, 3 fig, 1 append.

Descriptors: Demand, Costs, Governments, Economies of scale, Return.
Identifiers: *Optimality, *Collective goods, Homogeneous groups, Interpersonal comparisons, Subgrouping.

This paper discusses the problem of what is the optimal level of government for the production of collectively produced goods. Such a question is applicable to the water area in sectors such as water purification, anti-pollution measures and water supply. The paper is concerned with situations where economies of scale are not exhausted and where it is thus more costly to supply the service on a smaller scale, and with situations where segregation of consumers into homogeneous groups is not easy. The discussion of the first problem is basically at the individual level, and no interpersonal comparisons are necessary. The discussion of the second does involve such comparisons. (Loeb-Rutgers)
W70-02996

POSITIVISTIC MEASURES OF AGGREGATE SUPPLY ELASTICITIES: SOME NEW APPROACHES,
Oklahoma State Univ., Stillwater.
Luther G. Tweeten, and C. Leroy Quance.
AER, Vol 59, No 2, p 175-188, May 1969. 14 p, 4 tab, 14 ref, 3 disc.

Descriptors: *Elasticity of supply, Prices, Regression analysis.
Identifiers: *Positivistic measures, *Aggregate supply elasticities, Farm output, Direct least squares, Aggregate supply function.

Supply elasticities indicate the speed and magnitude of output adjustments in response to changes in product price. The authors are concerned in this paper basically with the elasticity parameter for aggregate farm output. Questions which the authors attempt to answer in this paper include: What is the magnitude of the elasticity of U S farm output with respect to price in the long and short run Is the elasticity increasing over time as the ratio of purchased to nonpurchased inputs increase. Are farmers less responsive to price decreases than to price increases as fixed asset theory implies. Three positivistic approaches are used to estimate the aggregate supply elasticity. The first is a direct least squares estimate of the aggregate supply function. Two additional disaggregate approaches which circumvent at least some problems of intercorrelation are also used to estimate the supply elasticity. These quantitative approaches may prove to be useful estimating the elasticities of supply in the water area as well. (Loeb-Rutgers)
W70-02997

BUDGET CONSTRAINTS: REDUCING THE ADMINISTRATOR'S FREEDOM,
Minnesota Univ., Minneapolis.
J. E. Jernberg.
Public Management Vol 51, No 8, p 10-13, Aug 1969. 4 p.

Descriptors: *Budgeting, *Decision-making, *Environment, *Technology, Taxes, Industries, Economics, Revenue, Education, Management, Community development.
Identifiers: *Budget constraints, *Community resources, Balanced budget, Appropriations, Expenditure accounting, Intergovernmental relationships.

The article considers the constraints on a budget-maker, past the normal establishment of categories for expenditure accounting control. Internal environmental constraints of the city's social and economic structure and characteristics are considered. Each community's characteristics determine its taxable resources and consequently affect managerial ability to fulfill community needs. Managerial willingness to fill these needs is another constraint, as is the decision-making of other governmental units. Reliance upon external revenue sources and related fiscal interdependence among levels of government is another important element that must be faced by the budget-maker, along with the obvious additional environmental factors. Since all of the problems cited are those faced in urban water resource planning, this article is of special interest to decision-makers in that field. (Murphy-Rutgers)
W70-03000

A COMPARISON OF DECISION CRITERIA FOR CAPITAL INVESTMENT DECISIONS,
State Univ. of New York, Buffalo.
C. C. Pegels.
Engineering Economist Vol 13, No 4, p 211-220, Summer 1968. 10 p, 3 tab, 6 ref, 1 append.

Descriptors: *Investment, *Capital, *Computers, *Input/output analysis, *Simulation analysis, Management, Planning, Time, Prices, Costs, Decision-making.
Identifiers: Output criteria, Cash flow, Probability, Common stocks, Rate of return, Decision criteria.

This article discusses the making of capital investment decisions. These decisions are based on one of several criteria. These are output criteria to aid selection from two or more investment proposals. This article reviews seven output criteria and compares them by simulating two hypothetical investment proposals on a digital computer. Although the computer results are not entirely conclusive as far as the investment decision is concerned, the simulation experiment demonstrates that investment proposals should be evaluated on the basis of several decision criteria rather than one preselected decision criteria. The method given is designed to facilitate and improve the quality of decision-making in capital investment problems. Since such decision-making is important in water resource projects, decision-makers in this field will find this article useful. (Murphy-Rutgers)
W70-03002

ECONOMICS OF LEAK SURVEYS,
Pitometer Associates, Pittsburgh, Pa.
Homer E. Beckwith.
American Water Works Association Journal, Vol 56, No 5, p 275-278, May 1964.

Descriptors: *Costs, *Leakage, *Economic efficiency, Statistics, Water transportation, Construction, Water treatment, Wells, Water rates, Water storage.
Identifiers: *Pumped water supplies, *Gravity water supplies, Capacity.

Water is considered free and the charges made are for the services of treatment and delivery. Due to the low costs, inefficiency is likely to be tolerated However, the aggregate costs of leaks in water transportation are likely to be sizable for the system as a whole. The distance which many cities must go for water, the increasing scarcity and the cost of treatment make this inefficiency intolerable. The author proposes increasing the metered rates as the most economically efficient way of obtaining additional water. The patented savings available in correcting leaks in both gravity supplies and pumped supplies is evaluated with the conclusion that the situation demands immediate correction. (Murphy-Rutgers)
W70-03006

COMPARATIVE COST EVALUATION OF DESALTED WATER SUPPLY VERSUS ALTERNATIVE FRESH WATER SUPPLY FROM A CONVENTIONAL SOURCE,
Texas Water Development Board, Austin. Planning Hydrology and Special Studies Div.
Donald E. Morris.
Paper presented at 50th Annual Meeting of American Geophysical Union, Wash, DC, Apr 24, 1969. 12 p, 5 fig.

Descriptors: *Cost analysis, *Desalination processes, *Water supply, *Texas, Saline water, Desalination plants, Brine disposal, Wells, Pipelines, Pumping plants, Fresh water, Water quality, Water chemistry, Economics.
Identifiers: Fresh water costs, Desalted water costs.

The cost of desalted water is generally higher than the cost of water from an alternative supply. The elements included in calculating the cost for desalting in Texas are: (1) well fields for saline feedwater supply; (2) intake system and pumping station; (3) pipelines; (4) pretreatment for saline water; (5) the desalting plant; and (6) brine disposal. The following elements were considered for calculating the cost of a conventional water supply: (1) raw water cost; (2) well field or intake system; (3) pipeline and required pumping stations; and (4) a conventional water treatment plant. Chemical water quality, secondary benefits, and project life are considered for final economic justification of a desalt project. Desalting is recommended as a practical interim solution for water supply problems in Texas. (Carstea-USGS)
W70-03082

A DECADE OF EXPERIENCE UNDER THE IOWA WATER PERMIT SYSTEM--PART ONE,
Iowa Univ., Iowa City.
N. William Hines.
Natural Resources Journal, Vol 7, No 4, p 499-554, Oct 1967. 5 tab, abt 140 ref.

Descriptors: *Iowa, Riparian rights, Administrative agencies, Beneficial use, Priorities, Administrative decisions, *Water permits.
Identifiers: *Permit system, *Iowa Water Permit Statute.

The article describes the Iowa permit system after its first ten years of existence. Part One includes Section I and Topic A of Section II. Section I examines riparian law in Iowa, reviews events leading up to enactment of the Iowa Water Permit Statute, examines the statute in detail, and compares present Iowa law to that of other jurisdictions. The statute has two main faults: it does not define any regulatory policy; and ideas drawn from various sources were never made consistent; some provisions actually contradict others. Similarities to western water law include employment of an allocation agency and utilization of the broad standard

of 'beneficial use.' Central difference are that Iowa accords no permanence of right and establishes no priority. Section II highlights issues faced in administering the permit system and describes in detail the endeavors of the Water Commission to resolve them. Topic A focuses on the issue of interpreting the scope of regulatory power. Decisions regarding vested rights, types of use to be regulated, amount of regulation to impose and the nature of rights granted by a permit are discussed. (See W70-03144). (Gossen-Chicago)
W70-03143

A DECADE OF EXPERIENCE UNDER THE IOWA WATER PERMIT SYSTEM--PART TWO,
Iowa Univ., Iowa City.
N. William Hines.
Natural Resources Journal, Vol 8, No 1, p 23-71, Jan 1968. 9 tab, 91 ref.

Descriptors: *Iowa, Administrative decisions, *Water permits, Priorities.
Identifiers: *Permit system, Processing applications, Permit transfer, Permit renewal, Permit modification, Permit termination, Permit suspension, Constitutionality.

The article describes the Iowa permit system after its first ten years of existence. Part Two includes: Topics B through E of Section II; Section III; and Conclusions. Section II highlights issues faced in administering the permit system and describes in detail the endeavors of the Water Commissioner to resolve them. Topic B describes the procedure for processing original applications. The application form, pre-hearing investigation, hearings, final determination, and appeal are discussed. Topic C focuses on the transfer of permits, D on renewal and modification, and E on termination and suspension. Section III reviews possible constitutional principles on which the Iowa Water Act might be challenged as deficient; substantive due process; procedural due process; and delegation of powers. The section on conclusions emphasizes the issue of priorities of use for times of scarcity. Iowa's policy of granting a permit for every beneficial use may be justified at present, but will require re-examination as demands increase. It is recommended that research be undertaken now to create standards for distinguishing among beneficial uses. (See W70-03143). (Gossen-Chicago)

Descriptors: *Water rates, Income, Public utilities.
Identifiers: *Two-part rate, New England, Service charge plus a commodity charge.

The doctrine of water rates set by public and privately-owned water utilities is the doctrine of fair and equitable rates. This doctrine means rates which avoid undue or unjust discrimination among the various classes of customers. The water system must be capable of producing, transmitting, and distributing the quantity of water desired by each customer at any given time. To be fair and equitable, the utility's rates and charges should be designed to reflect the savings inherent in the uniform use of water at higher load factors and conversely to reflect the higher costs inherent in low factor customers. Utilization of a two part rate consisting of a service charge plus a commodity charge is recommended. Histories of water rates in New England and of two part rates are given. The allocation procedures of such a two part rate is explained. (Grossman-Rutgers)

WATER SUPPLY - SANITATION - DITCHES (FINANCING).

Ohio Rev Code Ann secs 6101.62-6101.64 (Page 1953).

Descriptors: *Ohio, *Water rates, *Public utilities, *Financing, Water works, Public utility districts, Legislation, State governments, Regulation, Legal aspects, Assessments, Administrative agencies, Sewage disposal, Sewers, Liquid wastes, Local governments, Cities.

A public corporation may appropriate the unappropriated funds of the corporation's water department to pay the annual levies or assessments by a conservancy district organized for the purpose of water supply. Only a certain percentage of the funds may be appropriated, and the rates to be charged by the public corporation for the water supplied are set. To retire interest and bonds and thus reduce the amount to be collected through an annual levy, the board of directors of a conservancy district may raise the water rates chargeable to a public corporation or person within the district. Ceiling rates are set as are guidelines for imposing such rates over a period of years. Increased rates shall be paid from water-works funds. Revenue from the increased rates is solely for the retirement of bonds. To pay assessments for the collection of sewage and liquid wastes, the public corporation may appropriate funds from the sewer fund derived from sewer rentals. (Barnett-Florida)

SANITARY DISTRICT BOARDS OF APPRAISERS.
Ohio Rev Code Ann secs 6115.29 thru 6115.44 (Page 1953), as amended, (Supp 1970).

Descriptors: *Ohio, *Appraisals, *Project planning, *Cost-benefit analysis, Legislation, Legal aspects, Reservoirs, Right-of-way, Easements, Damages, Planning, Eminent domain, Costs, Estimated costs, Benefits, Estimated benefits, Sewage, Sewage disposal, Water supply, Construction, Judicial decisions, Taxes, Assessments, Cost analysis, Value, Sewage districts.
Identifiers: Hearings, Settlements procedure.

Every sanitary district will have a board of appraisers consisting of three appraisers appointed by the court and recommended by the board of directors of the district. The board will appraise all property to be acquired for the works of the district. The board will also appraise all benefits and damages accruing to all lands within or without the district because of the execution of the official plan of the district. The board will have the assistance of the attorney, engineer and other employees of the board of directors in carrying out its function. In making appraisals, the board will consider only the effect of the execution of the official plan. After the board files its report with the court, notice thereof will be published. After publication of notice, the court will conduct hearings on exceptions taken to the report. If the court, after such hearings, concludes that the cost of implementation of the official plan is less than the resulting benefits, it will approve the board report. If the court finds the cost of implementation will exceed benefits, the court may disorganize the district or order the board of directors to prepare new plans. (Keith-Florida)

6D. Water Demand

MAJOR USES OF LAND AND WATER IN THE UNITED STATES WITH SPECIAL REFERENCE TO AGRICULTURE-SUMMARY FOR 1964,
Agricultural Research Service, Washington, D.C.
Thomas H. Frey, Orville E. Krouse, and Clifford Dickason.
Report avail for sale from Superintendent of Documents, US Government Printing Office, Wash, DC, 20402. Department of Agriculture, Economic Research Service Report No 149, 1968. 74 p, 14 fig, 31 tab, 19 ref, append.

Descriptors: *Water supply, *Water utilization, *United States, Consumptive use, Irrigation water, Land resources, Land use, Surveys, Data collections.
Identifiers: U.S. Land and Water use.

The 48-State annual renewable supply of 30 inches of average precipitation is equivalent to about 4.50 billion acre-ft, or 402 billion gpd over an average year. About 70% of the precipitation is consumed in place to support forest, range, and other vegetation, including nonirrigated farmland. The balance is runoff or streamflow, supporting such nonwithdrawal uses as power generation, waste dilution, navigation, and recreation. About 304 million acre-feet of streamflow and ground water were withdrawn for all purposes in 1965. Roughly 30% was consumed in the sense of not being available for withdrawal again. Agricultural irrigation accounted for 41.4% of all withdrawals but, because of a high rate of consumptive use (60%), represented 82.7% of the total consumption or net depletion. This consumption occurred on about 37.8 million acres of irrigated farmland in 1965, of which 34.9 million acres were concentrated in the western mainland regions or States. The national rate of increase in irrigated farmland is 1.85%. (Knapp-USGS)

RIVER MANAGEMENT.

Peter C G Isaac, ed. Alabama, University of Alabama Press, 1967. 258 p.

Descriptors: *Water quality, Water demand, River regulation, Rivers, Measurement, Computers, Telemetry, Water pollution, River flow, Discharge, Floods, Biochemical oxygen demand, Groundwater, Economics.
Identifiers: *River management, *Water quantity, Hydrological data, Fisheries, River control, Economic model.

The demand for water in England and Wales has steadily risen. As such, there is a growing need to develop more effectively the resources of rivers. The work of river authorities has emphasized the importance of river management. In the past, the various demands on the rivers have been under the jurisdiction of various bodies with different aims. Drainage has competed with water supply, and both have competed with angling and recreation. Criteria must be developed for reconciling these conflicting demands and it seems likely that such criteria must be economic in nature. Before such criteria can be developed, however, a number of technical factors must be brought into a common focus. For example, no real progress can be made until it is recognized that river-water quality is no less important than river-water quantity. The underlying theme of the symposium, whose papers are contained in this volume, was the control of the quantity and quality of river water so that it may be used to best effect for all its multifarious purposes. LOS ANGELES CITY PROPER AND HARBOR MASTER PLAN FOR WATER SUPPLY,
Los Angeles City Dept. of Water and Power, Calif. Water Engineering Design Div.

Duane L. Georgson, Donald A. Trestik, John L. Graham, Toshio Fujimura, and E. S. Manirelli.
Report, City of Los Angeles Department of Water and Power, June 1966. 52 p, 16 fig, 8 tab.

Descriptors: *Water demand, *Water consumption, *Water supply, *Water conveyance, Aqueducts, Water distribution, Construction, Planning, Population, Forecasting, Urbanization, Construction costs, Project planning.
Identifiers: *Los Angeles, *Los Angeles harbor area.

The report presents a schedule of construction of water supply and distribution facilities required by the city of Los Angeles prior to the year 1990 to meet anticipated needs by the city proper and harbor area. The recommended $17.2 million construction program include a new water reservoir, reservoir modifications, new regulating stations, new water mains and trunk lines, and cement lining of some trunk lines. The study was made to permit prudent planning prior to design and construction in preparation for meeting the water needs of a population increasing at a rate of approximately 50,000 persons annually. It is estimated that the projected city population of 4,485,000 persons will use water at an average rate of 1,285 cfs in 1990, based upon 185 gallons per capita/day. This would be an increase of 66 per cent over the average 1963 consumption rate. Water system operating problems and needs anticipated in 1969 are also presented in the report in order to plan for utilization of water supplied by the Second Los Angeles Aqueduct beginning in late 1968. Proposed 1969 system operations, improvements and necessary adjustments to present facilities are described. (Poertner-Chicago)

EFFECTS OF NON-PRICE VARIABLES UPON PARTICIPATION IN WATER-ORIENTED OUTDOOR RECREATION: COMMENT,
Wisconsin Univ., Madison.
E. J. L. David.
American Journal of Agricultural Economics, Vol 51, No 4, p 942-945, Nov 1969. 4 p, 2 tab, 5 ref.

Descriptors: *Recreation, *Regression analysis, Average income age, Education, Occupations.
Identifiers: *Dummy variables, *Explained variation, *Intercorrelation.

This paper is a comment on a previous article by Gillespie and Brewer, ('Effects of Nonprice Variables Upon Participation in Water-Oriented Outdoor Recreation', Amer Jour of Agr Econ, Vol 50, p 82-90, Feb 1968). Three criticisms of the original article are: (1) the amount of explained variance reported, (2) the dependent variable, and (3) the handling of the intercorrelations. The problem of intercorrelations may be dealt with through the use of dummy variables of groups of the intercorrelated variables. The use of 'number of visits' as a dependent variable leads to unequal weights between different observations. The use of a grouped or dummy dependent variable may help to correct this problem. Such a dependent variable will increase the amount of explained variance reported. The parameters were re-estimated using dummy dependent and independent variables. (Grossman-Rutgers)

LEISURE MARKET STUDIES: I. Beach Users, II. Marina Development,
Rutgers - The State Univ., New Brunswick, N.J. Urban Studies Center.
George Sternlieb, Robert W. Burchell, James W. Hughes, and Paul A. Woodell.
Urban Studies Center, Rutgers University, Feb 1969. 161 p, 8 exhibit, 172 tab, 1 append, 3 map.

Descriptors: *Beaches, *Marinas, On-site data collections, Surveys, Financing.
Identifiers: *Beach users, *Marina development, *New Jersey shore.

This report studied the uses of the New Jersey shore through the use of surveys and questionnaires. The beach user survey covered the following areas: Beach attendance, problems of development as seen by shore entrepreneurs, age of structures (facilities), race observations, means of transportation to the beach town, length of total stay, total number of individuals, accommodations, occupations of beach users, and possible improvements. In the section on marina development the report attempted to isolate the variables which make for marina expansion. It is recommended that the state should intervene and that more mechanics are needed. The report also discusses the historical development of marinas, the problem of marina development, the operation of marinas, and various aspects of public marinas. A large appendix of data on beach users and marinas is included. (Grossman-Rutgers)

WATER TRANSPORT COSTS,
Binnie and Partners, London (England); and King's Coll., London (England). Dept. of Civil Engineering.
N. Paine, and J. K. White.
J Instut Water Eng, Vol 23, No 7, p 435-448, Oct 1969. 14 p, 3 fig, 2 tab, 3 append.

Descriptors: *Water transfer, *Water demand, *Mathematical models, *Optimization, *Cost-benefit analysis, Design, Pumping plants, Pipelines, Discount rate, Digital computers, Water distribution (Applied).

A method was described for the outline design, at minimum present value of the costs, of a pumping scheme to meet a growing demand for water transport within a typical range of unit costs and discount rates. A cost function model was developed for the optimum transport system which consisted of pumping stations, pumps, motors, control gear and pipes to illustrate the formulation of the cost as a function of all parameters. A digital computer was utilized for evaluating the minimum value of the costs for a representative range of stage lengths and pipe diameters. The affects of varying the system data, the pipe diameter and stage length were discussed. The solution for a typical scheme was given as an example. Simply staging both the station and the plant every 10 years yields a near optimum solution. Non-optimum pipe stages can lead to significant increases up to 13 per cent in total cost. (Thiuri-Cornell)

STORAGE YIELD: EXTENDING THE SEQUENT PEAK ALGORITHM TO MULTIPLE RESERVOIRS,
Water Resources Engineers, Inc., Springfield, Va.; and Texas Water Development Board, Austin.
G. K. Young, and C. D. Puentes.
Water Resources Res, Vol 5, No 5, p 1110-1114, Oct 1969. 5 p, 2 fig, 5 ref.

Descriptors: *Reservoir Design, *Storage capacity, *Multiple-purpose reservoir, *Time series analysis, *Water demand, *Systems analysis, Irrigation water, Municipal water, Industrial water, Timing.
Identifiers: Sequent peak algorithm.

The sequent peak algorithm was extended to find volume requirements as a function of time. The objective of the study was to present and demonstrate a technique for finding storage requirements in a multireservoir system. The technique evolved from a design situation having demands (irrigation municipal and industrial) increasing over time. The need for storage was found and placed in time at that point which was the latest time the storage could be built into the system and still be completely effective in carrying water forward to satisfy future droughts, within a minimum cost water development plan. The multireservoir systems storage yield relationships were three-dimensional, having time as the additional variable: aggregated design drafts versus time and required systems storage versus time. The technique was useful in determining reservoir construction timing in multiple reservoir systems. The principal variable used in the algorithm characterized a reservoir storage history which was unbounded by volume limits. (Thiuri-Cornell)

BENEFICIAL USE OF WATER IN A RIPARIAN JURISDICTION,
G. Graham Waite.
Wis L Rev, Vol 1969, No 3, p 864-883, 1969. 19 p, 88 ref.

Descriptors: *Wisconsin, *Indiana, *Riparian rights, *Water allocation, Administration, Competing uses, Distribution, Legal aspects, Water contracts, Water demand, Water policy, Water resources development, Water utilization, Alteration of flow, Diversion, Legislation, Relative rights, Beneficial use, Preferences (Water rights), Appropriation, Consumptive use.

Recognition of water as a limited resource leads to demands for regulating its use. New water uses must be developed within traditional riparian doctrines. This is an examination of problems of riparianism and possible methods for their solution through the application of administrative techniques to recognized riparian concepts. The diversion of water away from riparian owners presents constitutional questions. Regulation of water rights must avoid arbitrary distinctions between landowners and land uses. In Wisconsin, where water is being beneficially used, the riparian owner's consent is required for diversion; administrative control is limited to surplus waters. Some power over water use is centralized in the Department of Resource Development. Broad construction of the statute creating the Department might authorize a water use permit system. Indiana authorizes state purchase of water for public use. Problems of riparian rights along original and diverted watercourses are discussed. Surplus waters are exempted from riparian rights. This raises a question of deprivation of property that the riparian owner might later have used. Problems of uses of diverted water are discussed. The author concludes that authority for state water management may be inferred from legislation in Wisconsin and Indiana. (Dye-Florida)

PROCEEDINGS TO ESTABLISH LANDINGS.
Miss Code Ann sec 7624 (1956).

Descriptors: *Mississippi, *Mississippi River, *Condemnation, *Public rights, Administrative agencies, State governments, Legislation, Navigable rivers, Inlets (Waterways), Bays, Bayous, Legal aspects, Public benefits, Land use, Riparian land, Docks.

Identifiers: *Boat landing.

Any three or more freeholders residing in a county bordering on the Mississippi River or other navigable river, bayou, bay, or inlet may petition the Board of Supervisors of such county to designate and set aside a parcel of land outside any municipal limits as a boat landing and cotton-yard for public use. The petition must identify the owner of the land proposed to be taken. The Board then shall determine whether such a landing is required for public convenience. If deemed necessary, the Board is to permit demarcation of a boat-landing site at a point most convenient for public use. (Barnett-Florida)

MISSISSIPPI WATER RIGHTS LAW,
Jack W. Pepper.
Am Water Works Ass'n J, Vol 50, No 8, p 997-1001, Aug 1958. 5 p, 3 ref.

Descriptors: *Mississippi, *Riparian rights, *Water rights, *Prior appropriation, Competing uses, Domestic water, Flood control, Industrial water, Irrigation water, Legislation, Municipal water, Obstruction to flow, Reasonable use, Riparian land, Riparian waters, Water pollution, Water law, Soil conservation, Dams, Drainage.

Despite an annual rainfall of almost sixty inches, increased industrial and irrigation demands have created the possibility of water shortages in Mississippi. Legislation created the Mississippi Water Resources Policy Commission to study this problem. The first laws adopted in Mississippi were based upon the riparian doctrine. Under this doctrine, the owner of land abutting a watercourse was entitled to use the water therein, undiminished in quantity and unimpaired in quality. The main fault with this doctrine is that it discouraged the full utilization of water resources. Even though modern courts adopted the principle of limiting riparian owners to reasonable use, non-riparians still had no right to the use of water from a watercourse. The Mississippi Water Rights Act of 1956 adopted the principle of water appropriation. This legislation, while declaring all natural surface water to be public water and subject to appropriation, recognizes numerous rights of riparian owners. The details of this legislation are outlined. Certain priorities are involved to insure an orderly development of surface waters. Other methods used to increase the available supply of water include prevention of waste and pollution and soil conservation practices to increase the groundwater recharge. (Schram-Florida)

RECREATIONAL USE OF ENTIRE PRIVATE LAKE BY RIPARIAN PARTIAL BED OWNER.
Kan L Rev, Vol 9, No 1, p 91-94, Oct 1960. 4 p.

Descriptors: *Kansas, *Riparian rights, *Lake beds, *Boundaries (Property), Recreation, Riparian land, Severance, Civil law, Competing uses, Navigable waters, Non-navigable waters, Ownership of beds, Relative rights, Boating, Water sports, Fishing, Lakes, Recreation demand, Water utilization, Navigation, Judicial decisions, Reasonable use, Ponds, Beds, Beds under water, Social needs.
Identifiers: Artificial lakes.

In a recent suit, the riparian owner of a minor portion of a natural lake bed sought to enjoin adjoining owners who prevented him from using the entire lake by erecting physical barriers along their boundary lines. The Florida Supreme Court held that the plaintiff was entitled to a reasonable use of the entire lake for recreational purposes. The court adopted the civil law rule of reasonable use in common with other owners as best suited for Florida in view of the emphasis tourism places on water recreation. Many states cling to the common law view of absolute real property rights which grants to the bed owner exclusive dominion over overlying water. The civil law rule is making an inroad into the absolute concept because of the inconvenience of determining bed and surface boundaries and because of the growing utility the common right concept has for water recreation purposes. In Minnesota the civil law rule has been extended to a mere riparian owner regardless of bed ownership. These two concepts have also been extended in some states to private artificial lakes subject to recreational uses and having more than one riparian owner. (Douberley-Florida)

OWNERSHIP OF LAND UNDER NON-NAVIGABLE LAKE (DUVAL V THOMAS, 114 So 2d 791 (FLA 1959)),
J. Menalco Solis.
Tul L Rev, Vol 34, No 3, p 641-647, Apr 1960. 7 p, 51 ref.

Descriptors: *Civil law, *Ownership of beds, *Lake beds, *Riparian rights, Florida, Louisiana, Judicial decisions, Boundaries (Property), History, Non-navigable waters, Lakes, Water law, Legal aspects, Foreign countries, Barriers, Reasonable use, Water rights, Prescriptive rights, Relative rights, Riparian land, Usufructuary right, Access routes.
Identifiers: Common law rule.

A corner of plaintiff's land was covered by a segment of a non-navigable, land-locked lake. Abutting property owners had constructed fences which joined in the lake to cut off the plaintiff's access to the major portion of the lake. An injunction was granted to the plaintiff and the fences were ordered removed. The Supreme Court of Florida held that a land-locked, non-navigable lake may be used by all owners of property covered by the lake so long as that use does not unreasonably interfere with the rights of the other proprietors. In so ruling, the court adopted the civil law rule and rejected the common law rule that an owner is restricted to using only that area of a lake within the boundaries of his property. Criticizing this holding, the author traces the development of the civil law in several foreign countries and in the state of Louisiana, and concludes that no known doctrine of the civil law provides authority for the result reached. The rights of the abutting landowners to enclose their property, therefore, should be upheld. (Schram-Florida)

MICHIGAN, WISCONSIN, NEW ENGLAND AND NEW YORK (WATER RIGHTS LEGISLATION),
Lynn M. Miller.
Am Water Works Ass'n J, Vol 50, No 10, p 1277-1278, Oct 1958. 2 p.

Descriptors: *Water law, *Water rights, *Cities, *Riparian rights, Water storage, Recreation, Water supply, Natural flow doctrine, Competing uses, Industrial water, Municipal water, Irrigation water, Legislation, Prior appropriation, Dams, Public rights, Irrigation programs, Adoption of practices, Impounded waters, Recreation demand, Water policy, Reasonable use, Water resources, Great ponds, Watershed control, Water use.

A review of trends in water rights legislation reveals that particular water problems are not universal, but local. The areas affected, however, may be relatively large. The rapid expansion of large metropolitan areas has produced particular problems. In Wisconsin and Michigan the greatest impetus to study water rights has been provided by irrigation demands in agricultural areas contiguous to metropolitan areas. The present turmoil here is caused by the lack of statutory water laws. Exhaustive research and study are required before adequate legislation can distribute water rights between municipalities, agriculture, recreation, and industry. A 1957 Wisconsin legislative committee was set up to study these problems. Great conflict has developed over the proposal by agricultural interests to abandon the riparian-rights and public-use principles and substitute the priority allocation philosophy. Although various proposals have been made, the solution appears to lie in storing excess waters during periods of high precipitation. The most significant water rights question in New York and New England is the right of public access to streams and impounded waters for recreational purposes. In Maine, and perhaps many other places, a favorable position now exists towards the public as opposed to the controversial position of the appropriator. (Schram-Florida)

RIPARIAN RIGHTS--INLAND LAKES,
Arthur H. Toothman.
U Miami L Rev, Vol 14, No 4, p 689-692, Summer 1960. 4 p, 21 ref.

Descriptors: *Florida, *Boundaries (Property), *Riparian rights, *Ownership of beds, Judicial decisions, Water law, Non-navigable waters, Lakes, Lake beds, Recreation, Legal aspects, Relative rights, Remedies, Water rights, Competing uses, Prescriptive rights, Riparian land, Boundary disputes.

A corner of respondent's property lay underwater in a land-locked, non-navigable lake. The owners of the contiguous tracts erected barriers along the property lines which united at the submerged corner, rendering respondent's sector inadequate for recreational purposes. Respondent sought a mandatory injunction for the removal of the barriers. The Florida Supreme Court granted the injunction, holding that each owner was entitled to use of the entire lake provided that such use did not interfere with the concurrent rights of the other owners. Under the common law, non-tidal, non-navigable lake bottoms were susceptible of private ownership. The owner of a segment of a lake bed, however, was restricted to use of those waters overlying his land. A minority of jurisdictions in the United States have held that each lake bottom owner is entitled to the use of the entire lake. The court, acknowledging the majority view, utilized its judicial discretion to take into account social and economic customs and adopted the more liberal minority viewpoint but labeled it 'civil law.' Because the civil law is broader in scope than the common law theory of riparian rights, Florida will need a further decision to determine the extent of the civil law adopted in this case. (Schram-Florida)

MISCELLANEOUS HIGHWAY PROVISIONS.
Wis Stat Ann secs 86.02, 86.022, 86.17 (1957).

Descriptors: *Wisconsin, *Highways, *Drainage systems, *Damages, Ditches, Lumber, Streams, Sluices, Legislation, Legal aspects, Local governments, Regulation, Tunneling, Maintenance, Transportation, Water supply, Water sources, Obstruction to flow.
Identifiers: Penalties (Civil).

Any person who injures a highway by obstructing it, by diverting a watercourse or sluiceway over it, or by any other act, will be liable in treble damages to the political division of the state charged with maintenance of the highway. Willfully obstructing traffic on a public highway by making any ditch or depression in, or by placing any obstruction on such highway is a misdemeanor. The placing of any obstruction in a ditch designed to drain a highway is also prohibited. The general public has the right to use and take water from any spring or creek which runs into or across the limits of any public highway. Such taking, however, must not interfere with the tunneling or piping of water for the purpose of draining or improving lands on either side of the highway. Any person wantonly interfering with the free use of such water shall be guilty of a misdemeanor, and shall be liable to any person injured thereby for all damages sustained. (Barnett-Florida)
W70-02919

WATERWAYS, BRIDGES AND DAMS USED FOR BRIDGES.

Wis Stat Ann secs 81.05, 81.38, 81.42 (1957), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Channels, *Highways, *Bridge construction, Bridges, Culverts, Administrative agencies, Boats, Navigation, Damages, Construction, Maintenance, Assessments, Costs, Taxes, Creasote, Lumber, Steel, Concrete, Cost sharing, Dams, Cities, Local governments, Transportation.
Identifiers: Navigability.

Town boards of towns with waterways suitable for general and useful navigation may adopt them as public waterways and expend highway funds to improve and maintain their navigability. Special appropriations are required for yearly expenditures in excess of $200.00. Towns are not liable for damages for defects in such waterways. Methods of cost sharing between towns and their counties for the construction and repair of bridges and culverts are described. When necessary, town boards may file petitions with the county highway committee for immediate construction or repairs. Structures shall be constructed of approved materials. Town boards may contract with private owners of dams for the use of such dams as bridges. (Duss-Florida)
W70-02920

HIGHWAYS, BRIDGES, DRAINS.

Wis Stat Ann secs 84.10-84.12, 84.14, 84.15 (1957), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Bridges, *Highways, *Administration, Bridge construction, Maintenance costs, Assessments, Cost sharing, Administrative decisions, Government, Insurance, Local governments, State governments, Cost repayment, Cost allocation, Administrative agencies.

The allocation of state funds for maintenance and operation of various types of bridges is provided. The State Highway Commission regulates the maintenance and operation of bridges. The Commission may acquire land and easements to be transferred to the federal government for the national parkway system. The eligibility of intrastate bridge projects for funds, procedure for initiating their construction, and the method of apportioning costs among counties and towns are provided. The Commission and the highway department of another state may determine details for bridges crossing state boundary waters. Costs for bridge construction are apportioned between states and benefitted counties within states. Interstate bridge construction is controlled jointly by the highway commissions of involved states. Such bridges become part of the state trunk highway system and are maintained toll-free after repayment of costs. Maintenance costs and Wisconsin's share of interstate bridges are obligations of the state. The state may insure bridges. (Dye-Florida)
W70-02921

LOCATION OF PIERS.
Pa Stat Ann tit 55, sec 281 (1964).

Descriptors: *Pennsylvania, *Piers, *Relocation, *Navigable waters, Locating, Legislation, Sites, Navigation, Navigable rivers, Coastal structures, Harbors, Coastal engineering, Engineering structures, Piles, Water policy, Legal aspects.

When any person has been authorized by act of assembly to build a pier in any of the rivers of the state, it is lawful to locate the pier as will best answer his purposes. Any change in the location of the pier is limited within a one hundred foot radius of the original location. In addition, any change of position cannot interfere with the navigation of the river or in any way injure private property. The direction and consent of the port wardens is required to construct a pier in any location where port wardens have been created by law. (Schram-Florida)

OBSTRUCTIONS IN HARBOR AND REMOVAL THEREOF.
Pa Stat Ann tit 55, secs 341-348 (1964).

Descriptors: *Pennsylvania, *Harbors, *Navigation, *Navigable rivers, Delaware River, Legislation, Administrative agencies, Wastes, Ships, Boats, Water pollution, Channels, Delaware River Basin Commission, Water law, Legal aspects, Jurisdiction.
Identifiers: *Obstructions to navigation.

After proper notice has been given, the owner of any canal boat, barge, or other vessel sunk in the channel of the Delaware of Schuylkill rivers within the limits of the Port of Philadelphia must remove such obstruction within ten days. Failure to comply subjects the owner to a one hundred dollar fine. In case of refusal or neglect to raise and remove sunken craft, the Harbor Commissioners shall have it removed at the expense of the owner. The removal expenses shall be a lien on the vessel and its cargo until paid. In case the penalty and expenses are not paid, the Commissioners may, after five days notice, sell the vessel and cargo at auction. If there is any deficiency, the President of the Commissioners may sue the owner for the amount of the deficiency. It is unlawful to cast any ballast, cinders, ashes, or any heavy article into the tide-way of the Delaware or Schuylkill rivers. There is a penalty of not more than one hundred dollars for every offense. (Schram-Florida)
W70-02927

FISHING LICENSES AND THE PENNSYLVANIA FISH COMMISSION.

Pa Stat Ann tit 30, secs 220-221.1, 229, 249, 250, 252-257, 265, 270, 290-293 (Supp 1969).

Descriptors: *Pennsylvania, *Permits, *Fish conservation, *Administrative agencies, Legislation, Legal aspects, State governments, Fish management, Fishing, Regulation, Control, Fish establishment, Fish reproduction, Fish hatcheries, Fish stocking, Leadership, Government finance, Capital, Fish, Fishing gear, Land tenure, Administration, Administrative costs, Administrative decisions, Wildlife conservation.

As related to fishing licenses, this act provides for: (1) the licensing of specified residents, nonresidents, nonresident aliens, and tourists; (2) license fees; (3) the appropriation of fees to the fish fund of the Pennsylvania Fish Commission; (4) exceptions from license requirements; and (5) complimentary licenses. The Pennsylvania Fish Commission is empowered to appoint assistant executive directors in charge of the Watercraft Safety Division and the Fish Management Division. The act also governs the following: (1) permission to fish for scientific and stocking purposes; (2) free distribution of fish from state fish hatcheries; (3) exclusive use of specified waters by children and disabled persons, and the planting of fish therein; (4) penalties for false representation in procuring fish; (5) which streams and lakes are to be open to the public for fishing; (6) the establishment by the Commission of nursery waters; (7) powers and duties of fish wardens; (8) Sunday fishing; (9) powers of officers to make arrests and destroy unlawful devices; (10) the establishment of a fish license fund and the purposes thereof; (11) the acquisition of lands by the Commission; and (12) donations to the Commission. PORT AUTHORITIES IN COUNTIES OF SECOND CLASS.
Pa Stat Ann tit 55, secs 551, 553 (1964).

Descriptors: *Pennsylvania, *Port authorities, *Transportation, *Rivers, Harbors, Construction, Eminent domain, Legislation, Local governments, Legal aspects, Water resources development, Zoning, Taxes, Tax rate, Operating costs, Tariff, Maintenance, Maintenance costs, Operating costs, Highways.

The increased commerce and prosperity in second class counties require more effective coordination of transportation facilities, greater utilization of

rivers, and the development of port authorities. Thus, to promote the safety and welfare, a port authority shall be established in each second class county. It is intended that the authority cooperate with and/or acquire existing transportation facilities. Said authorities shall be empowered: (1) to acquire any necessary property or interest therein by purchase, lease, or otherwise, and to construct, improve, maintain, repair, and operate facilities; (2) to make by-laws and regulations for the management of their affairs; (3) to fix, alter, charge, and collect fares, rates, rentals, and other charges for its facilities by zones or otherwise to provide for the expenses of the facility; (4) to borrow money and issue negotiable notes and bonds; (5) to have the power of eminent domain; (6) to pledge or otherwise encumber any revenues of the authority; and (7) to establish carrier routes for the efficient operation of the transportation system. Private rights and property in the beds of existing public highways vacated for the purposes of the authority shall not be deemed destroyed or ousted by reason of such vacation. (Schram-Florida)
W70-02936

DOCKS AND WHARVES.
Pa Stat Ann tit 53, secs 16844-16848, 16852, 16854, 16858 (1957).

Descriptors: *Pennsylvania, *Docks, *Port authorities, *Surveys, Bridges, Piers, Piles, Legislation, Administrative agencies, Easements, Permits, Low water mark, Coastal structures, Delaware River, Local governments, Erection, Construction, Navigable rivers, Mapping, Channels, Boundaries (Property), Tidal waters.
Identifiers: Wharf lines.

A four thousand dollar fine is provided for extending or erecting any wharf into the tideway of the Delaware River contrary to this act. An application fee and license fee are authorized for the construction of any wharf on the Delaware or Schuylkill rivers. No district within Philadelphia County shall receive a license to erect such wharves without having filed a plan of the river front bordering such district. The jurisdiction of the Board of Wardens for the Port of Philadelphia is extended to include every navigable stream within Philadelphia County. When any person is licensed pursuant to this act to construct a wharf and said wharf would be erected where any fishing right or easement exists, the licensee may petition the county court. A plan for the establishment of wharf lines, showing the present low-water line, is outlined for Delaware County. After the survey of the Delaware River front is made and the low-water line established, trespassing upon said line shall be punishable by a fine of up to four thousand dollars. (Schram-Florida)
W70-02937

WIDEN, EXTEND OR RELOCATE HIGHWAYS.

Pa Stat Ann tit 53, sec 13802 (1957).

Descriptors: *Pennsylvania, *Highways, *Road construction, *Boundaries (Property), Highway relocation, Tunnels, Legislation, Conveyance structures, Bridges, Access routes, Roads, Streams, Interstate streams, Structures, Local governments, Interstate.

Any city of the first class may lay out, widen, extend, or relocate highways that connect with, or are approaches to, bridges or tunnels across streams forming the boundary between this and any other state. The council may also, at its discretion, construct viaducts or other structures or superstructures to carry such highways over other highways and property. Any such improvement, however, must substantially follow the course of the existing streets of the city which are in the most nearly direct continuous line with such bridge or tunnel. (Schram-Florida)
W70-02938

ACQUISITION OF PROPERTY.
Va Code Ann sec 33-255.5 (1953).

Descriptors: *Virginia, *Riparian land, *Eminent domain, *Beds under water, Riparian rights, Ownership of beds, Condemnation, Right-of-way, State governments, Legislation.

The State Highway Commission is empowered to acquire lands lying under water and riparian rights as necessary and convenient for any project. Property or property rights may also be acquired by condemnation or be eminent domain when necessary. (Douberley-Florida)
W70-02991

BRIDGE NOT TO OBSTRUCT NAVIGATION OR FISH.
Va Code Ann sec 33-216 (1953).

Descriptors: *Virginia, *Bridges, *Navigation, *Fish barriers, Bridge design, Navigable waters, Navigable rivers, Barriers, Fish passages, Engineering structures, Legislation.

Toll bridges authorized by this act must not be constructed so as to obstruct navigation or the passage of fish. (Douberley-Florida)

SILVER SPRINGS INC V THE CANAL AUTHORITY OF THE STATE OF FLORIDA (USE OF ADVICE FROM THE CORPS OF ENGINEERS).
226 So 2d 893-894 (I DCA Fla 1969).

Descriptors: *Florida, *Eminent domain, *Decision making, *Recreation, Judicial decisions, Condemnation, Condemnation value, Canals, Planning, Project planning, Coordination, Recreation facilities, Land use.
Identifiers: *Corps of Engineers.

Petitioner sought review by certiorari of an eminent domain proceeding on the grounds that the Canal Authority abused its discretion by allowing the Corps of Engineers to determine the quantity, location, and quantum of the lands to be acquired and the need of the lands for canal purposes. The court refused the writ, holding that the evidence supported the finding that the decision was the independent determination of the Authority. In view of the dominant and integral functions being performed by the Corps of Engineers, it was not an abdication of responsibility to rely heavily upon their expert advice and recommendations. It was alleged that one parcel was intended for recreational purposes only, a purpose which was held to be unauthorized under the statute in a prior decision, but the court found no basis for the contention. If any land was found to be acquired for recreational purposes, it was to have been excluded from the eminent domain proceedings by application to the trial court. (Douberley-Florida)
W70-03025

MUNICIPAL ELECTRIC ASSOCIATION OF MASSACHUSETTS V FEDERAL POWER COMM'N (REVIEW OF POWERPLANT LICENSE).

414 F2d 1206-1210 (DC 1969).

Descriptors: *Hydroelectric project licensing, *Standby power, *Water utilization, *Federal Power Act, Pumped storage, Federal project policy, Judicial decisions, Hydroelectric plants, Hydroelectric power, Powerplants, Electric power production, Water utilization, Engineering structures, Electric power demand, Electrical networks, Water distribution (Applied), Future planning (Projected), Project planning, Optimum development plans, Utilities, Non-consumptive use, Reservoirs.

Petitioners contested the awarding of a license by the Federal Power Commission to construct and operate a pumped storage hydroelectric power plant designed to provide power for periods of peak load. The court held that the Commission had not abused its discretion. Since a license to construct a power project authorizes the licensee to appropriate public water resources, the Commission must feel that the project is the highest and best use of the resource before the license may be granted. The court held that the urgent need for the project, the lack of feasible alternatives, and the proposals made for conservation and recreation justified the granting of the license. Although the project was not fitted into a comprehensive power plan for the area, the Commission was within its authority to approve the project. It was claimed that a larger facility was needed, but the Commission was held to be not unreasonable in authorizing the urgently needed smaller facility, since it could be easily expanded. (Douberley-Florida)
W70-03087

UNITED STATES V 959.68 ACRES OF LAND (ENHANCED VALUE THROUGH CHANGED PROJECT PLANS).
415 F2d 401-403 (3d Cir 1969).

Descriptors: *Condemnation value, *Appreciation, *Project life, Judicial decisions, Condemnation, Compensation, Economic impact, Value, Market value, Property values, Reservoirs, Planning, Project planning, Programs, Federal project policy, Reservoir sites, Riparian land, Land appraisal, Federal government.

Initial plans for a reservoir project indicated that only the lower portion of the land in question would be taken, but the plan was subsequently changed so that the remaining portion was included in the condemnation proceeding. The Government contested the fact that the amount paid for the upper portion reflected an enhanced evaluation because of its anticipated riparian status created by the project. In affirming the judgment, the court held that payment for the enhanced value was proper. The critical issue was whether it seemed probable when the project was announced and undertaken that it might be enlarged as to include the additional land. It was immaterial that the entire tract was condemned at once rather than acquired in separate portions, or that there was no reliance on the Government's assurances that the upper portion would not be needed. When land near a public project, but not indicated at the outset as probably to be included, is genuinely enhanced by the project, the Government, when it later determines to take these other lands, must pay their enhanced market value. THE LEGAL FRAMEWORK OF THE ST LAWRENCE SEAWAY,
M. Cohen, and G. Nadeau.
U Ill L Forum, Vol 1959, No 1, p 29-50, Spring 1959. 22 p, 63 ref.

Descriptors: *St. Lawrence Seaway, *International Joint Commission, *Multiple-purpose projects, *International waters, St. Lawrence River, St. Lawrence Seaway Develop. Corp., Governments, Federal government, Rivers, Inland waterways, River flow, Regulated flow, Dam construction, Hydroelectric power, Hydroelectric plants, International commissions, Great Lakes, International law, Treaties, Locks, Engineering structures, Navigation, Boundary disputes, Cost sharing, Project planning.

The St. Lawrence Seaway has no overall agreement as its legal framework, but is an example of two nations accommodating their common interests in an international watercourse. Political, economic and legal problems were resolved after two generations of negotiations that resulted in a patchwork of international convention arrangements and municipal public law. The cooperative framework for the separate development of power and navigation projects was based on a simple exchange of notes, passage of parallel legislation by each country, and an order of approval from the International Joint Commission (IJC). The Boundary Waters Treaty between the United States and Canada was designed to solve potential problems with relation to boundary waters and rivers running along the boundary. The Treaty established the IJC with judicial, investigative and administrative functions, and its order of approval was the most important basis of cooperation. It provided general rules and created machinery for managing common interests in the waterway construction and in regulating flow levels. Statutes passed by each country deal with liability for damages, and the order of approval allocates costs. Cooperation between the corporations set up by each country to construct the Seaway took the place of a unified authority. (Douberley-Florida)

AUTHORIZATION TO ACQUIRE LAND FOR INDUSTRIAL PURPOSES AND FOR PORT AND TERMINAL FACILITIES.
Miss Code Ann sec 7549.7-01 (1956), sec 7557.8 (Supp 1968).

Descriptors: *Mississippi, *Harbors, *Port authorities, *Land reclamation, Land development, Legislation, Administrative agencies, Local governments, Rivers, Bays, Lakes, Boundaries (Property), High water mark, Ownership of beds, Storage, Regulation, Dredging, Land forming, Landfills, Tidal waters, Land tenure, Cities, Land resources, Land use, Legal aspects.

The port commissions of Mississippi have jurisdiction over all land which is now, or was at one time, below the mean high tide mark of any river, bay, or natural lake. This jurisdiction extends to lands adjacent to ports and harbors as well as to lands acquired by lease, purchase, or eminent domain from individuals or corporations by the city or port commission. The commission is authorized to reclaim such lands by filling, dredging, or other means, and to utilize, lease, or dispose of these lands for the development and operation of the port. Any city or county, or both, may acquire or sell land situated in such county, whether within the city limits or not, for industrial purposes or for port, terminal, landing, and storage facilities. For this purpose, the cities and/or counties are empowered to borrow money and issue bonds, notes, or certificates as security. Land bought by a city, or cities, whether alone or jointly with a county, may not be located more than seven miles from the city's corporate boundaries. (Barnett-Florida)

IMPROVING RAILROADS AND CANALS.
Pa Stat Ann tit 15, secs 4071, 4081 (1967).

Descriptors: *Pennsylvania, *Canals, *Railroads, *Structures, Docks, Bridges, Piers, Streams, Rivers, Navigation, Navigable waters, Navigable rivers, Transportation, Aqueducts, Stream improvement, Riparian rights, Diversion, Right-of-way, Channel improvement, Cities, Legislation, Legal aspects.
Identifiers: Obstruction to navigation.

Railroad companies may erect docks, wharves and piers in any navigable stream where necessary for public and business purposes. Any such railroad company may also take and hold lands, wharves, docks or piers provided that the navigation in streams or rivers shall not be impeded by said railroad structures. Structures in Philadelphia are restricted by rules applying to that city. For the purpose of securing the safety of property and persons and increasing transportation, any railroad, canal or slack-water navigation company may straighten, widen, deepen, enlarge or otherwise improve their lines of railroads, canals, and slack-water navigation and the bridges, crossings, aqueducts, piers and structures thereof. For the above purposes railroad and navigation companies may purchase, hold, and use, or enter upon and appropriate lands and materials and use of lands for the flow of water diverted by any structure or embankment. (Smith-Florida)
W70-03184

ACCESS TO CANALS AND NAVIGABLE STREAMS.

Pa Stat Ann tit 15, secs 4320, 4321, 4324, 4325 (1967), as amended, (Supp 1969).

Descriptors: *Pennsylvania, *Railroads, *Streams, *Canals, Right-of-way, Transportation, Navigable waters, Navigable rivers, Riparian rights, Access routes, Roads, Mining, Coal mines, Economics, Occupations, Legislation, Legal aspects.

When the owners of any railroad possess the landing where the railroad joins a canal or other navigation, and any lateral railroad is constructed to connect with said railroad for the purpose of using the landing for trade, and the owners of the landing refuse to permit the trade of said lateral railroad, then the county court shall determine the proper fee for an appropriate portion of the landing and shall direct the landing to be open to the public. The users of lateral railroads may procure landings or wharves. Certain wharf owners are exempt from these provisions. This act shall apply to all navigable streams in Armstrong County. It shall be lawful for owners or lessees of iron ore or coal mines to construct lateral railroads from said mines to any railroad, public road, or navigable stream, over or under any intervening lands, provided that no existing mine or county line shall be crossed. These sections were repealed by section 2204 (i) of Title 15 insofar as they relate to business corporations and foreign business corporations. (Smith-Florida)

POWER AND SUPPLY PERMITS.
Pa Stat Ann tit 32, secs 592-595, 598 (1967).

Descriptors: *Pennsylvania, *Hydroelectric plants, *Dam construction, *Permits, Federal government, Navigable waters, Legislation, Legal aspects, Administration, Management, State governments, Alteration of flow, Obstruction to flow, Electric power production, Hydroelectric project licensing, Islands, Steam, United States, Federal jurisdiction, Administrative agencies, Powerplants, Dams.

Any power dam or change in stream to develop power on navigable waters or affecting the interests of interstate or foreign commerce is within the jurisdiction of the United States. Permits for construction of power dams not within the United States' jurisdiction are valid for fifty years. Permits for the construction of dams on waters within the jurisdiction of the United States are issued by the Water and Power Resources Board, subject to subsequent licensing by the Federal Power Commission. Permits are subject to an annual charge to pay the cost of administering this act. A permit is required in order to use any dam to develop water power for the generation of electric energy for use in public service. Any permittee may, with the consent of the Board, submerge, occupy, use, and overflow any island owned by the Commonwealth appurtenant to the power project. The provisions of this act in relation to production of steam power within the jurisdiction of the United States are suspended until the Federal Power Commission requires licenses for such projects. The Attorney General may institute proceedings to revoke a permit for violations of these provisions. (Barnett-Florida)

FISHING WITH NETS AND SET LINES.
Wis Stat Ann secs 29.30, 29.33, 29.336, 29.34, 29.343, 29.35, 29.36, 29.37 (1964), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Permits, *Commercial fishing, *Fish, Wildlife, Gars, Rough fish, Fish conservation, Legislation, Regulation, State governments, Nets, Fyke nets, Gill nets, Fishing gear, Boats, Administrative agencies, Inspection, Inland waterways, Mississippi River, Rivers, Legal aspects, Control.
Identifiers: Licensing.

Restrictions concerning the use of nets and set lines for catching game fish are set forth. Minimum requirements as to size and type, and as to time limitations for the use of certain nets are stipulated. Licenses are required for the use of nets and set lines. Noncompliance with the provisions of this act may cause the license to be revoked or cancelled. Licenses must be procured for commercial fishing in outlying waters. Fees will be assessed for the licenses depending upon the applicant's residency and upon the size of his boat. Special licenses are required for fishing with special equipment for designated species of fish. A license is required to use set or bank poles in inland waterways. The use of set lines must be licensed by the Conservation Commission. The Commission may request reports from any licensees concerning the amounts and kinds of fish caught with set lines. (Barnett-Florida)

FISH HATCHERIES AND FISH PROPAGATION.

Wis Stat Ann secs 29.50, 29.51, 29.513, 29.515, 29.52, 29.53, 29.535, 29.536 (1964), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Fish hatcheries, *Fish reproduction, *Fish conservation, Legislation, Legal aspects, Ponds, Fish stocking, Permits, Rough fish, Fish barriers, Navigable waters, Beds, Public rights, Water supply, Cities, Mississippi River, Navigation, Regulation, Fish, Fish eggs, Fish management, Administrative agencies.
Identifiers: *Game fish, Trespass, Penalties (Criminal).

The State Conservation Commission is given general charge of the propagation and breeding of fish, the diffusion of useful information relative thereto, and the general management of the state fish hatcheries. No person may remove fish or fish eggs from the state unless he has been issued a permit by the Commission. The Commission may erect barriers to exclude rough fish from the waters of the state provided such barriers will not unreasonably interfere with navigation. Any person owning all of the land bordering on a landlocked navigable lake may apply to the Commission for a permit to remove, destroy, or introduce fish into such lake. Trespassing on state fish hatcheries is a criminal offense. The Commission will issue permits for private fish hatcheries to any owner or lessee of lands suitable for propagating fish. Owners and lessees of particular types of land may, with Commission approval, operate private hatcheries for the purpose of propagating rough fish. To lawfully import fish into the state for stocking purposes, one must obtain a permit from the Commission. Cities may operate fish hatcheries after obtaining permission from the Commission. (Keith-Florida)
W70-03194

HARBORS AND NAVIGATION.

Wis Stat Ann secs 30.12, 30.13, 30.15, 30.16, 30.17 (1964), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Permits, *Riparian rights, *Structures, Resource development, Legislation, Legal aspects, Administrative agencies, Regulation, Jurisdiction, Piers, Buoys, Docks, Navigable waters, Beds, Bulkhead line, Navigation, Streams, Obstruction to flow, Recreation, Public rights, Rivers, Canals, Harbors, Construction, Riparian land.
Identifiers: *Riparian owners, *Obstructions to navigation, Pierhead line, Penalties (Criminal).

In the absence of legislative authorization or a permit granted by the Department of Resource Development, it is unlawful to deposit any material or place any structure on the bed of any navigable water where no bulkhead line has been established or beyond a lawfully established bulkhead line. Under certain conditions the Department may grant any riparian owner a permit to build for his own use a structure otherwise prohibited by statute. A permit may likewise be granted to enable a riparian owner to place a layer of sand on a bed adjacent to his property for recreational improvement. Riparian owners may build piers without a permit provided the piers do not interfere with public rights or rights of other riparian owners. Such piers are subject to any established pierhead line. Various types of obstructions to navigation are made unlawful and certain exceptions are noted. Certain governmental units are given authority to remove obstructions to navigation under specified conditions. It is made unlawful to intentionally remove or moor to a government buoy or beacon. (Keith-Florida)

NAVIGABLE WATERS, HARBORS, AND NAVIGATION.

Wis Stat Ann secs 30.20-30.25 (1964), as amended, (Supp 1969).

Descriptors: *Wisconsin, *Beds, *Water resources development, *Interstate compacts, Legislation, Legal aspects, Navigable waters, Public rights, Cities, Regulation, Water levels, Recreation, Riparian land, Zoning, Federal government, Public utilities, Permits, Dams, Great Lakes, Structures, Water supply, Sewage treatment, Sewage disposal, Navigation, Water pollution control, St. Lawrence Seaway, Harbors.
Identifiers: *Great Lakes Basin Compact, Penalties (Criminal).

A contract from the Department of Resource Development is required in order to remove any material from the beds of navigable lakes or outlying waters. The conditions under which the Department is authorized to grant such contracts are specified. When any lake area becomes unfit for recreational use, the Department may establish zones within which riparian owners may remove material from the lake bed to restore the area to recreational use. Public utilities acting pursuant to municipal permits may construct such structures on beds as are necessary to secure an adequate water supply to the utility, improve navigation or harbor facilities, or generate electricity. Provision is made for the Governor to appoint commissioners to the Wisconsin Great Lakes Compact Commission. It is the duty of the Commissioners to represent the state on the Great Lakes Commission and work for the development of the St. Lawrence Seaway. It is the policy of the state to aid in the accomplishment of the purposes of the Great Lakes Basin Compact. The state accepts the transfer of federal project structures and property on the Upper Fox River. No effort will be made to improve specified portions of the Wolf River. (Keith-Florida)

Identifiers: *Footbridges.

The board of trustees of any township which is composed in whole or in part of islands accessible from the mainland only by watercraft may levy a property tax to purchase and operate a scow or lighter large enough to carry road building materials. Any board of township trustees may provide for and maintain bridges over its streams. The board may also construct and maintain footbridges over rivers and streams to provide school children convenient access to the public schools. The cost of such footbridges shall not exceed one thousand dollars apiece. (Dearing-Florida)

REGULATION OF THE TAKING OF CERTAIN FISH FROM THE PUBLIC WATERS OF RHODE ISLAND.
R I Gen Laws Ann 20-14-1 thru 20-14-5, 20-15-1 (1968).

Descriptors: *Rhode Island, *Striped bass, *Fish, *Atlantic menhaden, Legislation, Commercial fishing, Fish management, Nets, Seines, Trapping, Interstate, Bays, Inlets, Permits, Atlantic Ocean, Size, Fishing, Natural resources, Water resources.

No person, firm or corporation shall take from the public waters of this state any striped bass measuring less than sixteen inches in length. The use of a net, seine, or any other contrivance is prohibited in the taking of striped bass; a hook and line, spear, or authorized fish traps may be used. This chapter does not apply to fish being transported in unbroken packages originating outside, and destined beyond this state's limits. Fines and suspension of fish trap licenses may be imposed upon violators of this act. It is unlawful for anyone to take with purse net or seine any fish commonly known as menhaden, provided that residents and certain Rhode Island corporations may obtain annual licenses to take menhaden. (Casey-Florida)

COOPERATION IN FEDERAL PROJECTS.
R I Gen Laws Ann secs 20-2-1 thru 20-2-5 (1968).

Descriptors: *Rhode Island, *Fish management, *Wildlife management, *Administrative agencies, Wildlife, Legislation, Legal aspects, Federal government, Projects, Conservation, Natural resources, United States, Inter-agency cooperation, Regulation, Planning, Programs, Financing.

The United States Fish and Wildlife Service of the Department of the Interior is authorized to conduct fish-cultural work in state waters, and Rhode Island assents to the conduct and establishment of wildlife restoration, fish restoration and management projects as defined by, and in compliance with, federal statutes and regulations. The Division of Conservation, with the approval of the Director of Natural Resources, is authorized and directed to conduct and establish cooperative programs in these areas. Provisions for appropriations and disbursements of state funds are provided. (Casey-Florida)

HAZARD AND CHOICE PERCEPTION IN FLOOD PLAIN MANAGEMENT,
Chicago Univ., Ill.
Robert W. Kates.
Chicago, Illinois, University of Chicago, 1962. 157 p.

Descriptors: *Floods, *Decision-making, *Nonstructural alternatives, Flood control, Flood damage, Resource management, Flood plains, Economic evaluation, Risks, Planning, Flood protection, Population, Probability, Costs, Economic justification, Regional flood.
Identifiers: *La Follette, Tennessee, *Hazard evaluation, Information availability.

The first chapter of this book is devoted to a restatement of the paradox of greater flood control and increasing flood damages and the alternatives for flood damage reduction. The second chapter is of primary importance to the student of resource management and deals with the relevancy of decision theory and decision-making schema to resource management, particularly flood plains and the reasons for their occupation. The following chapter presents the results of the study performed on the flood problems of La Follette, Tennessee and the decisions of the people of that area along with reconnaissance studies in six other areas. Following this, the type of information available to these areas and its effect on flood control is discussed. The theoretical range of choice perceived by the people is evaluated. The book concludes with a discussion of the role in flood damage reduction played by the decision-making process and the information available to managers. (Murphy-Rutgers)

6G. Ecologic Impact of Water Development

RESOURCES IN AMERICA'S FUTURE,
Hans H. Landsberg, Leonard L. Fischman, and Joseph L. Fisher.
Baltimore, Maryland, The Johns Hopkins Press, 1963. 1017 p.

Descriptors: *Natural resources, *Demand, *Supply, *Recreation, *Water resources, Land, Mineralogy, Population, Industrial production, Income, Management, Expenditures, Investment, Foods, Textiles, Construction, Transportation, Heat, Crops, Lumber, Metals, Energy.
Identifiers: Labor force, Public policy, Price systems, Clothing, Durable goods, Containers, Packaging, Paper products, Military goods, Woodpulp, Mineral fuels, Nonfuel materials

One of the great questions before any nation concerns the adequacy of natural resources to provide the kind of living its people desire. Even in the United States, with large resources of land, water, energy, and minerals, one finds concern regarding the over-all adequacy of resources to support the rate of growth of the economy. The core of this book is the projections of demand and supply of natural resources including their products and services as well as the basic land, water, and minerals to the year 2000. The projections make a comprehensive, interrelated system consistent with more general projections of population, labor force, production, and income. The authors feel that the picture that emerges will be helpful to anyone who has the responsibility for, or is interested in, the resources futre of the country. The authors also indicate at many points in the book the problems which loom in the future as a result of lack of correspondence between estimated demand and supply. The closing of these gaps is the business of public policy and private management to the extent that the job is not to be done automatically by the price system. Mainly, however, the book serves as a background for considering policies, not as a treatise on policies themselves. The crucial role of water and water resources in the future growth of the economy makes this book of interest to the water planner. (Loeb-Rutgers)

THE CHESAPEAKE BAY INSTITUTE WAVE FOLLOWER,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
Mart Peep, and Ronald J. Flower.
Chesapeake Bay Institute Technical Report 58, Reference No 69-11, Sept 1969. 76 p, 28 fig, 14 ref, 1 append. Contract Nonr 4010 (11); ONR Proj No NR 083-016.

Descriptors: *Instrumentation, *Anemometers, *Waves (Water), *Estuaries, Height, Winds, Flow measurement.
Identifiers: *Wave follower, Hot-wire anemometer, Hot-film anemometer.

The CBI Wave Follower was designed to hold anemometers at fixed distances from 60 cm to 1 cm from a water surface with waves up to 30 cm in height. It allows adjustment for tidal changes in mean water elevation up to 60 cm and for slow vertical scanning. In studies of wave generation an exploration of the wind field close to the water surface is critical. Such an exploration can be made with a hot-wire or film anemometer mounted on a device driven by a servomechanism which will maintain the anemometer at a fixed distance from the fluctuating water surface. EVALUATION OF NUCLEAR METHODS OF DETERMINING SURFACE IN SITU SOIL WATER CONTENT AND DENSITY,
Corps of Engineers, Vicksburg, Miss. Waterways Experiment Station.
T. B. Rosser, and S. L. Webster.
Report available from Clearinghouse as AD-688 079 for $3.00 in paper copy, $0.65 in microfiche. Corps Engineers Waterways Experiment Station Miscellaneous Paper S-69-15, Apr 1969. 36 p, 2 fig, 16 plate, 7 ref, 1 append. DA Proj No 4A024401A891.

Descriptors: *Nuclear moisture meters, *Soil moisture meters, *Calibrations, Laboratory tests, On-site tests, Gamma rays, Density, Soil moisture, Soil water, Instrumentation, Moisture content.
Identifiers: Neutron soil moisture meters, Gamma-ray soil moisture meters.

Laboratory tests were made to evaluate accuracy and reliability of measuring surface in situ soil water content and density by the backscatter and direct transmission nuclear methods using a single nuclear device and scaler. The device functioned as a surface backscatter moisture and density meter or as a direct transmission density probe. Five soil types were tested to approximate a full range of possible construction materials. Each soil was tested at 8 different known densities and water contents. To obtain comparative results, soil densities of each sample were determined by 2 accepted conventional field methods (sand-cone and water-balloon). In situ densities by the direct transmission nuclear method using the factory calibration curve furnished with the device were as accurate as densities obtained by the sand-cone and water-balloon methods. The nuclear method using a WES-developed calibration curve provided slightly more accurate density measurements than either conventional method. Densities determined by the surface backscatter nuclear method using both the factory calibration curve and a WES-developed curve were not as accurate as conventional methods. A WES-developed calibration curve was sufficiently accurate for most quality control fieldwork. A test procedure for determining surface layer density and water content of soil by nuclear methods is presented. (Knapp-USGS)

DELINEATION OF SHEAR ZONES AND APPLICATION TO RESERVOIR ENGINEERING USING APOLLO 9 MULTISPECTRAL PHOTOGRAPHY,
Alabama Geological Survey, Tuscaloosa.
William J. Powell, Charles W. Copeland, and James A. Drahovzal.
Alabama Geological Survey, Open-file Report, 1970. 51 p, 13 illus, 3 tab, 5 ref.

Descriptors: *Remote sensing, *Water resources, *Infrared radiation, *Structural geology, Hydrogeology, Groundwater, Streamflow, Low flow, Springs, Water wells, Water yield, Faults (Geology), Alabama, Appalachian Mountain Region.
Identifiers: *Lineations, *Multispectral photography, Apollo 9, Coosa River.

One of the most significant features disclosed by the interpretation of the multispectral Apollo 9 space photographs is the relatively straight long lineations that intersect Appalachian structural axis. Because little or no offset in topographic features is evident along most of the traces, the lineations are thought to represent fractures. Orientation analysis suggests that the fractures result from a reoriented stress field developed some time after the main phase of the Appalachian Mountain building. Apparent coincidence of the lineations with areas of known anomalies of streamflow, of large capacity wells and springs, quarry drainage, and dam leakage problems suggests that lineations may not only be of geologic significance but of great hydrologic, environmental, and economic significance. SEASONAL VARIATION IN RAIN GAGE CATCH,
Department of Agriculture, Washington, D.C.; and Weather Bureau, Silver Spring, Md.
J. L. McGuinnes, and Grant W. Vaughan.
Paper presented at 50th Annual Meeting of American Geophysical Union, Wash, DC, Apr 21, 1969. 8 p, 2 fig, 2 tab, 11 ref.

Descriptors: *Rain gages, *Precipitation gages, *Calibrations, *Precipitation (Atmospheric), Summer, Winter, Lysimeters, Instrumentation, Rainfall intensity, Seasonal, Nebraska, Ohio, Gaging stations.
Identifiers: Rain gage catch, Rain gage calibration.

In nothern Ohio 8-inch standard rain gages consistently caught more precipitation in summer and less in winter than adjacent digital punch gages, although average annual totals were almost identical. A similar seasonal pattern was found in a comparison of precipitation catch by weighing lysimeters and adjacent weighing-type recording rain gages in Ohio and in a comparison of standard and recording rain gage catch in Nebraska. Some reasons for the differences and their implications are discussed. (Carstea-USGS)

ELECTRONICS STARTS SOLVING THE PROBLEMS OF THE CITIES,
Roger K. Field.
Electronic Design, Vol 16, No 1, p 65-93, Jan 4, 1968. 21 fig.

Descriptors: *Electronic equipment, *Remote sensing, *Remote control, *Technology, *Treatment facilities, Water treatment, Water quality control, Telemetry, Computers, Cities, Urbanization, Municipal water, Municipal wastes, Monitoring.
Identifiers: *Electronic technology, *Advanced technology, Aerospace technology, Urban problems.

This field investigation identifies the design problems involved in applying aerospace technology to today's problems. The major problems that the cities face are lack of money and experience in advanced technology. Adaptation of existing military, aerospace and industrial technology has been successful in a few instances. Examples are Sacramento's water distribution system and sewer maintenance program, Los Angeles' air pollution monitoring and water reclamation programs, San Jose, California's computer-controlled traffic system, New York City's rapid-transit communication and routing system, and Chicago's technologically advanced police department. The municipal functions lending themselves most readily to electronic instrumentation are waste disposal and water reclamation. These functions demand special accurate measuring and sensing devices to quantify factors such as turbidity, biochemical oxygen demand and chemical oxygen demand. They also require strip-chart recording devices to display data on a periodic basis. In Sacramento, water level sensors feed electronic signals to control board to pinpoint the location of water back-up problems. Waterproof TV cameras detect construction flaws in underground pipes. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 7, p 46-56, 1967. 11 p, 5 fig, 1 tab. OWRR Project B-006-OKLA.

Descriptors: *Floods, *Illinois, *Computer programs, *Data processing, *Computer models, Streamflow forecasting, Channel morphology, Drainage patterns (Geologic), Flood forecasting, Peak discharge, Synthetic hydrology.
Identifiers: *Illinois River, Drainage basin morphology.

Floods occurring on the Illinois River over the past 30 years were studied, using the United States Geological Survey gaging station records at Tahlequah, Oklahoma. Other gaging stations on the Illinois have partial records covering 10 and 17 year periods. The floods occurring during overlapping period of record were compared and the response was evaluated with respect to flood peak magnitude, length of channel, and morphology of the basin. The comparative behavior of the flows at the gaging stations was incorporated in a computer program. This computer program was used to synthesize flood flows occurring during the period of missing records. (Knapp-USGS)

A CONTRIBUTION TO ANALOGUE AND PHYSICAL MODELING OF SURFACE RUNOFF PROCESS IN SMALL BASINS,
Jaromir Nemec, and Miloslav Moudry.
Proceedings in International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 11, p 80-85, 1967. 6 p, 17 ref.

Descriptors: *Rainfall-runoff relationships, *Model studies, *Analog models, *Hydraulic models, *Mathematical models, Routing, Rainfall disposition, Simulation analysis, Streamflow forecasting, Runoff forecasting.
Identifiers: Watershed models.

In order to evaluate the influence of different elements of the surface runoff process, particularly during flood flow, concentration time is selected as a compound factor. Its variation is analyzed by the use of modeling devices, including the analog electronic model and a physical scale model of a watershed. For electrical modeling the RC electrical analog EMU PR 27, developed by the Hydrometeorological Center of USSR was selected. The theoretical principles and the electronic equivalent of the concentration time are discussed. A simultaneous study of the problem uses a physical scale model of a small experimental watershed, gaged for extended period. The influence of rain intensity on lag time is studied in both models, electronical and physical, as compared with the prototype in nature. (Knapp-USGS)

NUCLEAR BLAST RESISTANT WATER WELLS,
Naval Civil Engineering Lab., Port Hueneme, Calif.
J. A. Norbutas.
Report available from the Clearinghouse as AD-687 704, for $3.00 in paper copy, $0.65 in microfiche. Naval Civil Engineering Laboratory Technical Report R624, Port Hueneme, California, May 1969. 51 p, 10 fig, 3 tab, 35 ref, 5 append. Proj No Y-F011-05-02-353.

Descriptors: *Water wells, *Design, *Nuclear explosions, *Safety, *Construction, Excavation, Nuclear engineering, Seismic waves, Casings, Structural design, Structural engineering, Structural stability.
Identifiers: *Well design, *Well construction, *Blast-resistant wells.

A proposed concept and associated design criteria for blast-resistant water wells are presented. Emphasis is on the design of deep wells for the cooling of hardened shelters. The scope of the study is limited to blast overpressures under 300 psi and weapon yields less than 20 Mt. A unique feature of the concept is the use of a gel-like material to isolate the well casing from blast-induced ground motions. The concept was developed from the results of a survey of reported well damage caused by earthquakes, earth subsidence, and underground detonations; a search of the literature on isolation and hardening techniques; and an analytical study based on existing, unclassified nuclear weapon effects theory. Recommendations are given to field-test the concept and to direct further work toward extending the weapon effects range. (Knapp-USGS)

THE BUCKLING OF STEEL LININGS IN SHAFTS AND TUNNELS,
Wartmann et Cie A.G., Brugg (Switzerland).
Ernst Amstutz.
Schweiz Bauztg, Vol 87, No 28, p 541-549, July 1969. Transl from Ger, Bur Reclam Transl 826, Sept 1969. 23 p, 10 fig, 2 tab, 12 ref.

Descriptors: *Tunnel linings, Shafts (Excavations), *Buckling, *Steel linings, Safety factors, Theory, Deformation, Shear forces, Tension, Bending moments, Foreign research, Stress-strain curves, Displacements, Laboratory tests, Model tests, Groundwater, Failure (Mechanics), Pressure, Economics, Foreign design practices.
Identifiers: Switzerland, Grouting pressure, Stiffeners, Slenderness ratio, Test results.

A theory of buckling of circular steel linings in shafts and tunnels, formulated by the author and accepted in technical literature, is presented. Correctly judging the buckling danger of shaft and tunnel steel liners from grout pressure or external water pressure is economically important. According to this theory, relatively small factors of safety are sufficient to prevent failures. Results of buckling experiments performed on test models are compared with computed theoretical values. Good agreement was obtained with the theory for smooth liners and for liners having shear anchors when correct material constants were used in the theoretical formulas. (USBR)

AQUEDUCT CONTROL SYSTEM SAVES $100 MILLION,
California State Dept. of Water Resources, Sacramento.
Alfred R. Golze.
Power Engineering, p 30-35, Oct 1969. 2 fig, 3 ref.

Descriptors: *Aqueducts, *Water conveyance, *Water delivery, *Water supply, *Water resources development, *Water transfer, Water structure, Water shortage, Construction, Computers, Automatic control.
Identifiers: *California, *Southern California, California Department of Water Resources.

The article describes the concepts and progress of the California State Water Project, the first statewide water resources development in the United States. It is the largest single hydro project in the world to be financed at one time. The estimated cost is over $2.6 billion. An estimated 70 per cent of the State's rainfall occurs north of San Francisco. The project includes construction of a 450 mile aqueduct to transport this water to the drier areas in southern California. Construction began in 1961 and is near the halfway mark. The eight power generating facilities along the waterway will provide a maximum annual output of 6.2 billion kilowatt hours. In the overall system there will be 27 pumping stations and power plants having a total of 170 separate electrical-mechanical units; 66 check structures with 213 separate gates; and a minimum of 49 major water turnout structures where deliveries will be made to customers. Each of the pumping plants has been designed for computer control and each is interfaced with the aqueduct control system so that remote manual or computer control of each plant is possible. The completion date is set for 1972. (Poertner-Chicago)

NEEDLE VALVES AS PRESSURE REGULATORS,
Colorado State Univ., Fort Collins.
J. Paul Tullis, and Maurice L. Albertson.
Proc Amer Soc Civ Eng, J Hydraul Div, Vol 95, No HY5, p 1633-1649, Sept 1969. 17 p, 7 fig, 13 ref, append.

Descriptors: *Cavitation, *Pressure regulators, *Needle valves, *Energy dissipation, Jets, Hydraulic gates and valves, Closed conduits, Valves, Hydraulics, Water control, Research and development, Erosion, Fluid mechanics, Laboratory tests, Orifices, Submerged orifices.
Identifiers: *Energy dissipators, Cavitation control, Submerged flow, Test results, Cavitation index.

The potential of needle valves issuing into sudden expansions as primary components of large closed conduit pressure regulating structures is analyzed. Results of research projects conducted to evaluate hydraulic characteristics of needle valves are presented. Flow characteristics of the needle valve are described by presenting a submerged jet issuing from a circular orifice into an expansion chamber. Basic principles and equations of fluid mechanics are applied to predict qualitatively the cavitation, pressure fluctuation, and energy dissipation capa-

bilities of submerged jets. A literature review of related studies is presented, and a description of facilities used for testing is given. Tests indicate that needle valves are ideally suited for pressure regulation in closed conduit systems, having the capability of dissipating large amounts of energy with little cavitation or pressure fluctuation. Special attention should be given to the design to maximize the streamlining of the valve and to eliminate the possibility of local cavitation zones. (USBR)
W70-02960

DISPERSIVITY TENSOR FOR TURBULENT UNIFORM CHANNEL FLOW,
Hydronautics, Inc., Laurel, Md.
Gedeon Dagan.
Proc Amer Soc Civ Eng, J Hydraul Div, Vol 95, No HY5, p 1699-1712, Sept 1969. 14 p, 3 fig, 20 ref, 2 append.

Descriptors: *Dispersion, *Turbulent flow, *Streamflow, *Channel flow, *Uniform flow, Hydraulics, Thermal pollution, Two-dimensional, Reynolds number, Three-dimensional, Bibliographies.
Identifiers: *Thermal diffusion, Isovels.

The turbulent mixing of a solute in a streamflow is described with the aid of the dispersivity tensor. In a 2-dimensional pipe or wide channel flow, only the radial (vertical) dispersivity coefficient is significant and is usually determined through the Reynolds analogy. The analogy is extended to a 3-dimensional (channel of arbitrary section) uniform flow. The mixing length theory leads to the representation of the dispersivity tensor in terms of 2 distinct coefficients: (1) a coefficient representing mixing normal to isovels found through Reynolds analogy; and (2) a lateral dispersivity coefficient that must be determined from dispersivity measurements. (USBR)
W70-02962

MECHANICS OF FLOW FROM STRATIFIED RESERVOIRS IN THE INTEREST OF WATER QUALITY; HYDRAULIC LABORATORY INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
Joseph P. Bohan, and John L. Grace, Jr.
Waterways Experiment Station, Technical Report H-69-10, July 1969. 84 p, 12 tab, 23 ref.

Descriptors: Computer programs, *Hydraulic models, Intakes structures, *Reservoirs, *Stratified flow, Water quality.

Investigations were conducted to determine the characteristics of the withdrawal zone resulting from the release of flow through an orifice from a randomly stratified reservoir in experimental facilities for the purpose of developing means of predicting the quality of water discharged through similar openings in prototype intake structures. Distributions of density, generated by differentials in both temperature and dissolved salt concentration, and velocity were observed at various locations within a 1-ft-wide channel upstream of 0.08and 0.16-ft-square orifices. These data were used to develop generalized expressions describing the limits of the zone of withdrawal and the distribution of velocities therein. In certain cases, the proximity of the free surface and/or bottom boundary may dictate the upper and/or lower limits of the zone of withdrawal. Means were developed (Appendix A) for evaluating the conditions under which these boundaries dictate the limits of the withdrawal zone and for determining the distribution of velocities within a zone of withdrawal restricted by boundary conditions. A sample problem (Appendix B) is presented to illustrate application of the results to determine the maximum discharge that may be released through a square orifice for a given set of conditions without exceeding the limits of a desired hypothetical zone of withdrawal. The example also illustrates how the actual limits of the zone of withdrawal and the velocity distribution therein are determined. A method is illustrated for predicting the dissolved oxygen content and/or other water quality parameters of the outflow provided the vertical distributions of these parameters in the reservoir are known. A FORTRAN IV program is presented in Appendix C. This program can be used to solve three different approaches to the selective withdrawal problem: (1) determination of the allowable discharge for selected withdrawal limits and orifice size and elevation; (2) determination of the withdrawal zone characteristics for a selected discharge and orifice size and elevation; and (3) determination of the allowable discharge and orifice elevation for selected withdrawal limits and orifice size. The density and/or temperature profile in the reservoir must be known or assumed for all three conditions. The effect of orifice shape on the withdrawal characteristics was tested and analyzed after the draft of this report was prepared. The results were believed to be pertinent and are discussed briefly in the Discussion section of this report.
W70-03027

WEBBERS FALLS LOCK AND DAM, ARKANSAS RIVER NAVIGATION PROJECT; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
John J. Franco, and James E. Glover.
Waterways Experiment Station, Technical Report H-69-11, Aug 1969. 41 p.

Descriptors: *Channel flow, *Hydraulic models, Locks, Navigation.
Identifiers: *Arkansas River, *Navigation dams, Webbers Falls Lock and Dam.

Webbers Falls Lock and Dam will comprise a nonnavigable dam of 12 gated spillway bays, a 110- by 600-ft lock on the left bank, and a three-unit powerhouse with a discharge capacity of 35,500 cfs on the right bank. A 1:120-scale fixed-bed model was used to determine flood stages at the dam, navigation conditions in the lock approaches, tendency for sediment deposition in the lower lock approach, and magnitude of surges generated in the upper lock approach canal by lock filling, and to develop modifications required to provide satisfactory conditions. Modifications to the original design required to produce satisfactory navigation conditions in the approaches to the lock were developed and flow conditions through the spillway were improved. In general, results have indicated: Realignment of the entrance to the upper lock approach canal would be required to eliminate hazardous conditions for downbound tows attempting to enter the canal. Ports would be required in the upper guard wall to reduce crosscurrents near the entrance to the upper lock approach canal and to reduce surges resulting from lock filling operations. Surges would develop in the upper lock approach canal from lock filling operations. Magnitude of the surge could be reduced so that it would have no serious effect on navigation with ports in the upper guard wall and a surge basin near the lock. Water-surface elevations at the dam embankment to the left of the lock could be lowered by structures designed to eliminate overbank flow toward the embankment and improve the alignment of currents approaching the spillway. Sediment below the dam would be moved into the lower approach channel and could produce shoaling. Size of the surge basin and length of the upper guard wall could be reduced without any appreciable effect on navigation. The amount of excavation in the approach to the spillway could be reduced appreciably without affecting flow through the spillway.

GALVESTON BAY HURRICANE SURGE STUDY; REPORT 1, EFFECTS OF PROPOSED BARRIERS ON HURRICANE SURGE HEIGHTS; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
Noble J. Brogdon, Jr.
Waterways Experiment Station, Technical Report H-69-12, (Report 1), Sept 1969. 167 p.

Descriptors: *Hurricanes, Floods, *Hydraulic models, *Surges.
Identifiers: *Galveston Bay, *Hurricane barriers.

Design of barriers for protection of all or portions of Galveston Bay against inundation by hurricane surges required the use of hydraulic model studies of the Galveston Bay complex to verify the results of surge routings by analytical methods and to determine the effects of all proposed structures on normal tides and hurricane surge heights upstream and downstream from barrier sites. The Galveston Bay hurricane surge model reproduced the coast from Freeport on the south to High Island on Bolivar Peninsula on the east. The model included an average width of the Gulf of Mexico of about 25 miles, measured normal to the gulf; all of the barrier islands in the bay interior, including its many connecting arms, lakes, and lagoons; and the coastal area within this sector up to a maximum elevation of 20 ft msl; and reproduced normal tides as well as gulf surges created by hurricane forces. The model was of the fixed-bed type molded of concrete to linear scale ratios, model to prototype, of 1:100 vertically and 1:3000 horizontally. Automatic tide generators reproduced normal tides and tidal currents throughout the model. Hurricane surges were reproduced by a horizontal-displacement type surge generator. Either of the two major hurricane protection plans tested would provide protection for the area inland from the barrier when the navigation openings were closed. The Alpha plan, located on the coastline of the Gulf of Mexico, would provide protection for a greater area since it shelters practically the entire area inland from the coastline. The Gamma plan leaves unprotected a major portion of West Bay, the entire city of Galveston, and all of East Bay. The Texas City, LaMarque-Hitchcock system, when completed, will provide protection for these towns from surges of 15 ft msl.

LOW-WATER WEIRS ON BOEUF AND TENSAS RIVERS, BAYOU MACON, AND BIG AND COLEWA CREEKS, ARKANSAS AND LOUISIANA; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
Jackson H. Ables, Jr., and Marden B. Boyd.
Waterways Experiment Station, Technical Report H-69-13, Oct 1969. 41 p, 2 tab, 10 photo, 10 fig, append.

Descriptors: *Channel improvement, *Hydraulic models, Riprap, *Weirs.
Identifiers: Big Creek, Ark.; Boeuf River, Colewa Creek, Ark.; Macon Bayou, Tensas River.

A 1:20-scale model reproducing one-half of the channel section through a low-water weir was used to test eight plans of channel improvement. The tests were conducted with a drop height of 5.5 ft, and discharges up to 10,000 cfs were observed. Flow conditions and slope protection downstream from the weir to control the flanking problem were found to be satisfactory with channel improvement plans 6 and 8. Riprap with an average weight of 33 lb was used in slope protection in both plans. A model headwater-tailwater rating curve was obtained. A second 1:20-scale section model was constructed in a 2.5-ft-wide glass flume for more generalized riprap tests in the vicinity of the structure. Several drop structure plans were observed to develop an effective, economical drop structure. Of primary concern were development of some of the dimensions of various elements of the structure and determination of riprap requirements in the vicinity of the structure. Limiting tailwater curves for 220- and 325-lb riprap are furnished as a guide in riprap selection at drop structures with drop heights of from 5 to 10 ft. Suggestions as to the use of these curves also are included. A basin length of 20 ft is considered to be adequate at projects where the jet will ride through at unit discharges exceed-

ing about 10 cfs. It is recommended that the entire 20 ft be protected by riprap of the same size, whether 220- or 325-lb stone. A riprap plan which provides additional protection to the structure is presented in Appendix A. This plan was not considered warranted for initial construction because of increased cost. However, at weirs where maintenance is required it is planned that this work be performed so as to approach the riprap configuration proposed in Appendix A.
W70-03030

OUTLET WORKS FOR NEW HOPE RESERVOIR, CAPE FEAR RIVER BASIN, NORTH CAROLINA, HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
Edwin S. Melsheimer, and Noel R. Oswalt.
Waterways Experiment Station Technical Report H-69-14, Oct 1969. 4 tab, 5 photo, 14 fig. 46 p.

Descriptors: *Hydraulic models, *Outlet works, Stilling basins, Flow, North Carolina.
Identifiers: *New Hope Reservoir, Cape Fear River Basin.

Model investigation of the outlet works for the New Hope Reservoir was initially concerned with verification and improvement of the hydraulic design of the intake structure, conduit, and stilling basin. Subsequent tests involved observations of the effectiveness of the multilevel intakes in providing selective withdrawal of flow from the epilimnion or upper stratum of a stratified reservoir. The study was conducted in a 1:20-scale model of the outlet works which reproduced a portion of the approach area, the intake structure, the outlet conduit, the hydraulic-jump type stilling basin, and approximately 800 ft of exit channel. The proposed intake structure provided effective regulation of flood-control releases as well as those which are desired to to provide quality water downstream during both summer and winter. However, certain operational procedures are necessary to prevent dangerous subatmospheric pressures in the throat section of the water-quality system. Flow conditions in the original conduit intakes, throughout the flood-control facilities, and downstream to the conduit outlet were satisfactory with pressure conditions remaining positive for all discharges with little or no fluctuation. There was no tendency for structural vibration with either flood-control or water-quality flows. Performance of the original design stilling basin was unacceptable as unstable hydraulic action and eddy formation resulted in very turbulent basin conditions with little or no energy dissipation. Raising the elevation of the basin and lengthening and modifying the transition section (types 2 and 3 basins) resulted in adequate, if not ideal, performance. Single gate operation produced unbalanced flow in the basin; however, as single gate operation is rarely necessary, types 2 and 3 basins are considered acceptable for prototype construction. It was determined that riprap protection is required on both banks of the exit channel.
W70-03031

SPILLWAY FOR HUGO DAM, KIAMICHI RIVER, OKLAHOMA; HYDRAULIC INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
Bobby P. Fletcher, and John L. Grace, Jr.
Waterways Experiment Station Technical Report H-69-15, Nov 1969. 55 p, 1 tab, 14 photo, 24 fig.

Descriptors: *Hydraulic models, *Spillways, Kiamichi River, Oklahoma.
Identifiers: *Hugo Dam.

Model investigations were conducted to determine the adequacy of a gravity type spillway to be located on the Kiamichi River, Okla., for flood control, water supply, recreation, and fish and wildlife purposes. The investigation of the Hugo Dam spillway were primarily concerned with flow conditions in the approach channel, stilling basin, and exit channel. The model indicated that features of the original design structure were unsatisfactory; however, certain modifications that improved hydraulic performance and reduced construction costs were developed. The capacity of the spillway as determined with the model was greater than that computed. Subsequent modifications to the spillway design to effect economy and eliminate surging at the abutments did not affect the capacity. The performance of the original design stilling basin was satisfactory in the dissipation of all spillway discharges. However, alternate designs were developed to reduce construction costs without impairing hydraulic performance. The size and placement of riprap in the approach and exit channel were determined by model tests.
W70-03032

CHANNEL IMPROVEMENT, FIRE ISLAND INLET, NEW YORK; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
William H. Bobb, and Robert A. Boland, Jr.
Waterways Experiment Station, Technical Report H-69-16, Nov 1969. 261 p, 1 tab, 13 photo, 206 fig.

Descriptors: *Channel improvements, *Hydraulic models, Littoral drift, Shoals, New York.
Identifiers: *Fire Island Inlet, N.Y.

Fire Island Inlet, located on the south shore of Long Island, N.Y., connects the Atlantic Ocean with Great South Bay. The inlet is about 3 miles long and approximately 1/2 mile wide, extending generally east and west between Oak Beach on the north and the western end of Fire Island on the south. Great South Bay, to which Fire Island Inlet is the main entrance, is a tidal body 25 miles long and 2 to 5 miles wide with a general depth of about 6 to 25 ft at mlw. Attempts have been made to stabilize an entrance channel through Fire Island Inlet with little success. To study this problem a fixed-bed model (later converted to a movable-bed model) was constructed to scale ratios of 1:500 horizontally and 1:100 vertically, reproducing all of Fire Island Inlet and a portion of the Atlantic Ocean. Tides, tidal currents, and wave action in the Atlantic Ocean were reproduced. Results indicated that the plan originally recommended by the New York District, which included a littoral drift trap located in the entrance to the inlet, a rehandling basin in the inlet, a connecting channel of adequate depth for navigation by a loaded hopper dredge, and a 500-ft extension to the Federal Jetty, if modified to include a larger rehandling basin but without extension of the Federal Jetty, would meet all requirements for a combination scheme to stabilize the entrance channel and permit bypassing sand to downdrift beaches by means of conventional dredging plant. The construction of groins, deflection dikes, and closure dikes would not appreciably improve conditions obtained by the recommended plan alone. A plan involving an offshore breakwater and a littoral drift trap located between the breakwater and the beach would also function satisfactorily in every respect.

HYDRAULIC COMPUTATION OF FLOOD-PLAIN CHANNELS,
Le Van Kiyen.
Transl from Gidrotekhnika i Melioratsiya, No 9, p 50-52, 1968. Soviet Hydrology: Selected Papers, No 4, p 360-362, 1968. 1 tab, 3 ref.

Descriptors: *Channels, *Channel morphology, Flood plains, Rivers, Hydraulic properties, Chezy equation, Flood forecasting, Streamflow forecasting, Hydraulics, Model studies, Hydraulic models.
Identifiers: *USSR.

Field observations and over 300 laboratory experiments were used in the Hydraulic Laboratory of the Moscow Hydrometeorological Institute in order to obtain data for hydraulic computation of flood-plain channels. Two dimensionless coefficients allow for the main characteristics of the flood plain channel. Formulas for computation are given and discussed. (Carstea-USGS)

THE USES OF TURBINE INLET VALVES,
R. E. Passmore.
Water Power, Vol 21, No 9, p 347-351, Sept 1969. 5 p, 2 fig, 1 tab, append.

Descriptors: *Hydraulic turbines, Penstocks, *Hydraulic gates and valves, Intake gates, *Leakage, Benefits, Economics, Investigations, Repairing, Maintenance costs, Foreign research, Intake structures, Bulkhead gates, Gate seals, Costs, Hydraulic equipment, *Hydraulic valves.
Identifiers: *Wicket gates, Canada, Hydraulic pressure, Headworks.

When studies for hydroelectric developments show the most suitable scheme to be one having individual penstocks to each unit, inlet valves are not required for turbine isolation; then, inclusion of the valves must be justified on another basis. Shutoff devices at or immediately ahead of the turbine gates will prevent wear and provide additional benefits. Requirements for and economic justification of a shutoff device must be examined. Valve installation is required: (1) for unit isolation; (2) for penstock or power conduit protection; (3) for replacement of intake gates; or (4) for isolation of turbines from individual penstocks. The possible need for valves is examined for the situation covered by factor (4), and a formula is given for determining the annual cost of losses incurred by leakage through the turbine wicket gates when no inlet valve is provided. (USBR)

ENVIRONMENTAL CONSIDERATIONS IN DESIGN OF TRANSMISSION LINES,
Bureau of Reclamation, Denver, Colo.
Harry Brenman, and Dwight A. Covington.
Prepr 927, Amer Soc Civ Eng Nat Meet Transp Eng, Wash, DC, July 1969. 28 p, 13 fig, 3 ref, append.

Descriptors: *Aesthetics, *Transmission towers, *Transmission lines, Construction, Design, *Environmental engineering, Impact environment, Natural resources, Landscaping, Revegetation, Access roads, Maintenance, Power operation and maintenance, Right-of-way, Clearing.
Identifiers: Landscapes, *Beautification, Bureau of Reclamation.

The electric power industry has an important responsibility in facing up to the demands that have been alerted by the impact of our installations on the surroundings. The prime objective of transmission lines is to establish and maintain reliable electric service. However, the time has come when the environment in which we live must also be considered. Transmission line engineers must: (1) consider alinement and tower appearance in the design stage; (2) integrate, blend, and conceal the line with the surrounding environment; and (3) develop aesthetically acceptable structures. (USBR)
W70-02948

ALUMINUM VS STEEL IN TRANSMISSION LINE STRUCTURES,
L. A. Kirkpatrick.
Metal Progr, Vol 96, No 3, p 82-84, Sept 1969. 3 p, 2 fig.

Descriptors: *Transmission towers, *Guyed towers, *Aluminum, Optimum design, Electric power, Helicopters, Costs, Cost comparisons, Transmission (Electrical), Maintenance costs, Foreign design practices, Footings, Erection, Transportation.

Identifiers: *Aluminum towers, *Galvanized steel, *Comparative studies, Canada, Aluminum V-towers.

Aluminum transmission line towers have made inroads into the field of transmission line construction. Design innovations that have evolved are: (1) pinning the legs to the lower chord of the crossarm rather than extending the legs through the crossarm to the ground wire peaks; (2) using 8 guys to 4 anchors to aid in balancing leg loads and optimizing design; (3) using a Y-configuration with 8 guys as a means of minimizing leg sections; and (4) developing a pin connection at the junction of the Y combined with 8 guys to produce a structure having maximum ability to withstand transverse loads. Advantages of aluminum towers are discussed and ways that aluminum can compete with galvanized steel are reviewed. Initially, costs will be higher for aluminum towers than for steel towers, but a complete evaluation in determining the optimum structure for the installation is required. Expanding use of helicopters in transmission line construction will effect many savings. (USBR)

CHALLENGES OF UNDERGROUND TRANSMISSION AND DISTRIBUTION,
Commonwealth Edison Co., Northbrook, Ill.; and Commonwealth Edison Co., Maywood, Ill.
D. W. Gilman, and E. J. Steeve.
Prepr 956, Amer Soc Civ Eng Nat Meet Transp Eng, Wash, DC, July 1969. 14 p, 2 fig.

Descriptors: *Transmission (Electrical), *Transmission lines, *Electric power industry, Electric power costs, Costs, Electric power, Reliability, Design, Aesthetic, Right-of-way, Research and development, Environmental effects, Heat transfer, Economics, Electric insulation, Faults (Electrical), Failure (Power), Technology.
Identifiers: *Underground cables, *Underground transmission lines, Pipe-type cables, *Buried cables, Service life, Dielectric properties.

Transmitting electrical energy beneath the surface of the earth presents many challenges. The problems of capacity, reliability, and security seem to defy economic solution with present technology. The electric power industry has undertaken an expanded research effort aimed at removing the barriers to underground powerlines. Two primary motivations for underground transmission are the increasing cost of right-of-way space and the aesthetic compatibility with the environment. Basic differences between overhead and underground lines are described to clarify the engineering and construction problems in economically matching an underground cable to an equivalent overhead line. An understanding of the fundamentals of underground cable design leads to an appreciation of the challenges of undergrounding. Transporting electric energy is divided into 2 subclassifications, distribution and transmission. Costs of underground residential distribution (URD) have been reduced to where this type of curcuit is being widely used. The reliability of several high-voltage underground installations is noted. The cost of underground distribution and transmission lines is discussed and a line cost vs line capability graph presented. (USBR)

8D. Soil Mechanics

THE EFFICIENCY OF HORIZONTAL DRAINAGE LAYERS FOR ACCELERATING CONSOLIDATION OF CLAY EMBANKMENTS,
King's Coll., London (England).
R. E. Gibson, and Gilliane C. Shefford.
Bldg Res Sta Curr Pap, CP 24/69, p 327-335, June 1969. 9 p, 7 fig, 2 tab, 7 ref.

Descriptors: *Consolidation, *Drains, *Clays, *Embankments, *Horizontal drains, Drainage, Drainage practices, Pore water pressures, Drainage systems, Earth dams, Efficiencies, Permeability, Pore pressure, Pressure distribution, Design criteria, Soil engineering, Stabilization, Fills, Soil mechanics, Foreign research.
Identifiers: Drain spacing soil characteristics, Great Britain.

Efficiency of drainage layers in accelerating consolidation of clay embankments is considered and the influence of such factors as layer thickness, length, and permeability is examined. In order to be fully effective, a drain should have a permeability at least 1,000,000 times that of the surrounding clay fill, although an acceptable efficiency would be achieved with a ratio of about 30,000. A drainage blanket only 1,000 times more pervious than the fill is probably useless. (USBR)

8E. Rock Mechanics and Geology

THE EFFECT OF SATURATION ON VELOCITY IN LOW POROSITY ROCKS,
Massachusetts Inst. of Tech., Cambridge. Dept. of Earth and Planetary Sciences.
Amos Nur, and Gene Simmons.
Earth and Planetary Science Letters, Vol 7, No 2, p 183-193, Nov 1969. 11 p, 6 fig, 3 tab, 24 ref.

Descriptors: *Seismic studies, *Seismic properties, *Velocity, *Porous media, *Saturation, Fractures (Geology), Vibrations, Sound waves, Geophysics, Rocks, Geology, Rock properties, Voids.
Identifiers: Seismic velocity-pore geometry relations.

Seismic velocities are often significantly lower near atmospheric pressure than at pressures of a few kilobars in dry rocks with fracture porosity. When such cracks are filled with water, however, this lowering of velocity is significantly diminished for compressional waves. In contrast shear velocity is unaffected by the presence of fluid; low velocity persists at low pressure. The shape of the pores in typical crystalline rocks plays an important role: increase in compressional velocity due to saturation of pores occurs when the pores are in the form of cracks but not when they are in the form of round holes. As differences in compressional velocity of dry and saturated rock at low pressure may approach 50%, the degree of saturation of rocks must be taken into account in many engineering and shallow seismic applications. (Knapp-USGS)
W70-02862

THE EFFECT OF VISCOSITY OF A FLUID PHASE ON VELOCITY IN LOW POROSITY ROCKS,
Massachusetts Inst. of Tech., Cambridge. Dept. of Earth and Planetary Sciences.
Amos Nur, and Gene Simmons.
Earth and Planetary Science Letters, Vol 7, No 2, p 99-108, Nov 1969. 10 p, 5 fig, 2 tab, 35 ref. AEC Contract No AT (30-1)-3966.

Descriptors: *Seismic studies, *Seismic properties, *Velocity, *Viscosity, *Porous media, Fractures (Geology), Vibrations, Saturation, Sound waves, Geophysics, Rocks, Geology, Rock properties, Voids.
Identifiers: Seismic velocity-porefluid relations.

The effective shear modulus of a low porosity rock depends strongly on the viscosity of any fluid phase present in the microcracks. The bulk modulus is essentially independent. These results applied to the earth show remarkable agreement between the laboratory data and the facts known about the velocity zone in the upper mantle. (Knapp-USGS)

CALCULATIONS FOR PRESTRESSED PRESSURE TUNNEL LININGS,
Z. Radosavljevic.
Trans, Inst Vodoprivredu Jaroslav Cerni, Vol 14, No 44, p 13-24, 1968. 12 p, 7 fig, 3 tab, 3 ref.

Descriptors: *Pressure tunnels, Prestressed concrete, *Tunnel linings, *Prestressing, Tunnel design, Tunnel pressures, Grouting, Stress, Radial stress, *Stress relieving, Elastic deformation, Shrinkage, Calculations, Creep, Deformation, Cement grouting, Tunnels, Rock properties, Rock mechanics, Equations, Foreign design practices.
Identifiers: Pressure effects, *Stress relaxation, *Concrete linings, Concrete properties, Yugoslavia, Rama Hydroelec Proj (Yugoslavia).

Conventional concrete linings are not satisfactory for high-pressure tunnels because high pressures lead to cracking of concrete and a consequent rise in permeability. The requirement of impermeability is met primarily by using linings that are prestressed by a corset of high-pressure cement grouting, leading to a permanent state of compressive stress. To determine the necessary prestressing, the amount of stress relaxation that will occur must be determined. Prestressed linings exhibit stress relaxation because of (1) creep in the linings; (2) concrete shrinkage; (3) rock creep; and (4) shrinking, creep, and expansion of the hardened cement grout. Equations and sample calculations are given for determining stress relaxation. The pressure drop for prestressed linings lies within the 50-80% range and is primarily caused by creep in the concrete; next in order of influence are concrete shrinkage and low deformability of the rock. The influence of the elasticity, shrinkage, and creep of the hardened grout, and of the gap between lining and rock amounts to less than 3% and can be neglected in comparison with other factors. (USBR)
W70-02946

REINFORCEMENT YIELD CONDITIONS OF A REINFORCED CONCRETE MEDIUM WITH CRACKS,
N. I. Karpenko.
Stroit Mekh Raschet Sooruzhenii, No 2, p 24-26, Mar and Apr 1968. Transl from Russ, Bur Reclam Transl 743, Oct 1969. 10 p, 1 fig, 5 ref.

Descriptors: *Reinforced concrete, *Slabs, *Reinforcement, Structural engineering, Yield point, Yield strength, *Cracks, Equations, Strength, Elastic theory, Theory, Foreign design practices, Normal stress, Bending moments, Moments, Stress, Tensile stress, *Mathematical analysis, Stress analysis, Shear stress, Two-dimensional, Three-dimensional.
Identifiers: *Concrete slabs, Yield line theory, USSR, Compressive stress, *Yielding.

Yield line analysis is used to develop equations for reinforcement yield conditions in a slab. Concrete and reinforcement will carry the load in areas where cracks do not intersect; concrete is excluded from carrying any load at points where 2 or more yield cracks intersect. Equations are developed for each case. Limits for application of the equation are set. Elastic analysis is used to develop the conditions of strength and a characteristic equation for a 2-dimensional stressed state, and to develop the yield conditions for reinforcement in 3 mutually perpendicular directions. (USBR)
W70-02950

THE APPLICATION OF SPRAYED CONCRETE AND SURFACE CEMENTATION FOR ANCHORING THE ROCK FOUNDATION OF THE SHORE ABUTMENTS ON THE ASWAN HIGH DAM,
V. I. Savin.
Hydrotech Constr, No 11, p 984-990, Nov 1968. 7 p, 7 fig, 3 tab.

Descriptors: *Abutments, *Grouting, *Rock foundations, *Dam construction, *Gunite, Concretes, Concrete mixes, Concrete placing, Concrete construction, Earth dams, Cutoffs, Trenches, Grout curtains, Foreign construction, Excavation, Dam foundations.
Identifiers: *Sprayed concrete, *Surface treatment, Concrete linings, Grout mixes, Aswan Dam (UAR).

Shore abutments for the core and upstream apron of the Aswan High Dam are trenches cut down to solid rock. The sides of the excavation have a 5:1 slope. Rock surfaces were covered with sprayed concrete 10 cm thick over the contact area between the rock and clay core. The purposes of the sprayed concrete cover are to: (1) form a base for the surface cementation, (2) prevent grout emerging from the rock surface, (3) provide a facing for the rock surface to prevent entrainment of clay particles along the rock/clay contact in the event of seepage, (4) set up a joining surface between the clay core and foundation, and (5) preserve the rock against erosion. Surface cementation was applied by grouting to a depth of 3 m. Deep grouting of the rock was performed along the axis of the dam and along the contour of the upstream apron shore abutments. The concrete spraying and grouting operations are described. (USBR)

Descriptors: *Plates, *Shell structures, *Structural analysis, Deformation, Bending, Theory, Theoretical analysis, Displacements, Mathematical analysis, Deflection, Structural engineering, Finite differences, Stiffness.
Identifiers: *Finite element method, Static behavior, Matrix methods (Structural), Dynamic response.

In many situations, using pure oxygen offers an economically competitive alternative for artificial aeration of rivers and impoundments. Proper design of the oxygen injection system can make using pure oxygen very advantageous and achieve efficient absorption. The judicious selection of an oxygen injection system can result in side benefits and flexibility not possible when using air. The application of pure oxygen is economically competitive with air when attempting to aerate water that is about 50% saturated with dissolved oxygen or when attempting to achieve near-saturation concentrations in the effluent. Nitrogen concentration can present a serious problem when fish are involved, but can be alleviated by using pure oxygen. (USBR)

OPERATIONS AND PERFORMANCE OF NEW DISTANCE MEASURING INSTRUMENTS,
Environmental Science Services Administration, Rockville, Md.
Raymond W. Tomlinson.
Prepr 985, Amer Soc Civ Eng Nat Meet Transp Eng, Wash, DC, July 1969. 12 p, 1 fig, 1 tab.

Descriptors: *Surveying instruments, *Tellurometers, *Measuring instruments, Surveys, Measurement, Operations, Distance, Performance, Equipment, Testing.
Identifiers: Accuracy, Procedures.

Results are given of tests conducted by the US Coast and Geodetic Survey on the Wild Distomat DI-10 and the Tellurometer MA 100 distance measuring instruments, designed for precision on short distances. Both were easily operated by one person and the performance was very good. Persons with experience in operating microwave and electro-optical instruments need less than one-half day of instructions to obtain accurate measurements. Persons without field experience on this type of equipment should be given a 2- or 3-day training course under field conditions to become proficient operators. Because of the ease of operation and low price of a system, use of the instruments will result in better accuracy, increased production, and lower cost per mile of traverse projects. All field tests conducted for the DI-10 and MA 100 indicate that operation and performance will give accuracies of 1/50,000 or better within the claimed range. Results of measuring the same taped distances with each instrument are given. (USBR)

EDUCATION IN HYDROLOGY, UNITED STATES UNIVERSITIES-EARLY 1966.
Universities Council on Water Resources, Austin, Tex.

Texas Univ Report of Universities Council on Water Resources (UCOWR), July 1967. 44 p, 17 fig, 11 tab, 7 ref, 4 append. NSF Grant GE-7013 to Calif Univ, Los Angeles.

Descriptors: *Education, *Universities, *Hydrology, *United States, Engineering education, Training, Schools (Education), Surveys, Colleges.
Identifiers: Hydrology education.

At the institution surveyed, 859 faculty members reported some involvement with Hydrology education or research. The number of faculty members per institution varied from 1 to 42, with the median number being 8. Over half (52%) of the faculty have a background in Engineering, 22% in Biological Sciences, 20% in Earth Sciences and 6% in Other Fields. On the average, about 1/3 of faculty time is devoted to teaching, over 1/3 to research, and about 1/5 to public service or extension. Current effort occurs chiefly in Engineering, exceeding the combined effort in Earth Sciences and Biological Sciences departments. Most institutions offered courses with Hydrology content in several departments. Engineering departments offered more semester hours of Hydrology than the sum for the Earth Sciences and Biological Sciences departments. Civil Engineering departments account for about 306 students, while Forestry, Geology, Botony, Agricultural Engineering and Meteorology account for the remainder of a total of 340 students. In general, it is clear that the amount of student financial support available is low in those departments which produce the largest number of graduate degrees emphasizing Hydrology; these are Civil Engineering, Forestry, Geology, Botony, Agricultural Engineering, and Meteorology. 9C. Research Facilities

SUPPLY OF AND DEMAND FOR TRAINED WATER RESOURCES PERSONNEL: A PILOT STUDY, Parts 1 and 2,
Surveys and Research Corp., Washington, D.C.
Jacob Fisher.
Both parts available from the Clearinghouse as PB-189 045 (Pt 1) + PB 189 046 (Pt 2) $3.00 in paper copy, or $0.65 in microfiche. Report, Surveys and Research Corporation, Dec 31, 1969. Part 1, 189 p; Part 2, tables and append. OWRR Project C-1414.

Descriptors: *Manpower, *Labor supply, Occupations, Professional personnel, *Scientific personnel, Universities, *Training.
Identifiers: *Position characteristics, Position responsibility level, Position functions, Position requirements, Personnel demnd (Vacancies), Manpower demand forecasts, University faculty discipline identification.

The study was undertaken to test a methodology for obtaining measures of the supply of and demand for trained water resources personnel. The report presents the findings of three research projects: (1) a mail survey of 127 employing organizations selected to be illustrative of establishments employing trained water resources personneli in State and local governments, regional agencies, industry, engineering services, and non-profit organizations; (2) a mail survey of 17 universities with water resources institutes or engaged in teaching and research in water resources; and (3) a study of the employment of trained water resources personnel in the Federal government, based on interviews, correspondence, and examination of selected records. In the opinion of the survey staff, the methodological test successfully demonstrated the feasibility of a full-scale study of the subject. Recommendations are made on the scope and character of such a study, including sample size and data to be obtained.

10. SCIENTIFIC AND TECHNICAL INFORMATION

SOME ASPECTS OF THE SCIENTIFIC COMMUNICATION SYSTEM IN HYDROLOGY,
Department of Energy, Mines, and Resources (Ontario).
P. Meyboom.
Groundwater, Vol 7, No 4, p 28-37, July-Aug 1969. 10 p, 3 fig, 7 tab, 18 ref.

Descriptors: *Hydrology, *Publications, *Documentation, *Reviews, *Technical writings, Editing, Half life, Information retrieval, Bibliographies, Hydrogeology, Professional personnel, Technical societies, Data transmission systems, Communication, Professional societies, Data transmission.
Identifiers: *Communication systems, *Periodicals, *Information science, Professional advancement.

The scientific communication system is defined as the sum of all publications, facilities, occasions, and institutional arrangements permitting the direct or indirect transmission of messages among scientists. The system is considered according to 3 aspects: forulating, disseminating, and obtaining the message. A review of the extensive literature written about scientific communication is given. Ever since Bernal proposed to abolish all scientific periodicals, scientists have been concerned with ways and means of better communication. And yet, in spite of the profound improvements in technology, the average scientist is as archaic as ever in his communication. The purpose of this report is to inform hydrologists of the aspects of the scientific communication system that may be relevant to their work. Discussed are general concepts in scientific communication, characteristics of some well-known journals, and ways in which messages are obtained. Sex recommendations for making the best use of the scientific communication system are included, the most important being a rationale for restrained publication. (USBR)

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 3, NUMBER 9
MAY 1, 1970

W70-03244 -- W70-03646

Selected Water Resources Abstracts is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the Clearinghouse for Federal Scientific and Technical Information (CFSTI) of the Bureau of Standards, U. S. Department of Commerce. It is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U. S. Department of the Interior, Washington, D. C. 20240. Annual subscription is $22.00 (domestic), $27.50 (foreign), single copy price is $3.00. Certain documents abstracted in this journal can be purchased from the Clearinghouse at the prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 3, NUMBER 9
MAY 1, 1970

W70-03244 -- W70-03646

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources. WRSIC is not presently prepared to furnish loan or retention copies of the publications announced.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas. Centers, and their subject coverage, now in operation are:

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.

- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the FWPCA, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

In cooperation with the Federal Water Pollution Control Administration, the following "centers of competence" have been established:

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.
- Water quality requirements for freshwater and marine organisms at the College of Fisheries of the University of Washington.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

FOREWORD----------iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

ABSTRACT SOURCES

SELECTED WATER RESOURCES ABSTRACTS

01. NATURE OF WATER

1B. Aqueous Solutions and Suspensions

LABORATORY COMPARISONS OF FRESH-WATER AND SALT-WATER WHITECAPS,
Michigan Univ., Ann Arbor. Dept. of Meteorology and Oceanography; and Northern Michigan Univ., Marquette.
Edward C. Monahan, and Carl R. Zietlow.
Journal of Geophysical Research, Vol 74, No 28, p 6961-6966, Dec 20, 1969. 6 p, 6 fig, 7 ref.

Descriptors: *Fresh water, *Sea water, *Bubbles, *Laboratory tests, Saline water, Lakes, Oceans, Ocean waves, Analytical techniques, Photography, Simulation analysis, Drops (Fluids), Waves (Water).
Identifiers: *Whitecaps (Water waves).

The bubble spectrum produced by pouring sea water differs from the fresh-water bubble spectrum in that there are relatively more bubbles with radii below 500 microns for sea water. It is therefore concluded that whitecap lifetimes should be greater on the oceans than on the lakes. Confirming laboratory whitecap simulations indicate that salt-water whitecap areas decay almost exponentially with a time constant of 3.85 seconds, whereas the decay constant for fresh-water whitecaps is 2.54 seconds. W70-03256

A NONLINEAR APPROACH TO RUNOFF STUDIES,
College of Engineering, Madras (India).
V. C. Kulandaiswamy, and C. V. Subramanian.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 10, p 72-79, 1967. 8 p, 5 fig, 1 tab, 4 ref.

Descriptors: *Rainfall-runoff relationships, *Mathematical models, *Runoff forecasting, Computer models, Streamflow forecasting, Simulation analysis, Rainfall disposition, Unit hydrographs, Hydrograph analysis.
Identifiers: Watershed models.

The process of conversion of rainfall excess into surface runoff is studied by treating drainage basins as lumped systems. The rainfall excess is considered as inflow and the surface runoff as outflow. Making use of the equation of continuity, a differential equation used with field data indicates that the system behavior is nonlinear but can, however, be treated as linear by approximation in the case of major floods. The proposed equation is verified by applying it to observed storms, and the results are found to be very encouraging. This method of approach provides considerable scope for an analytical treatment of rainfall excess-surface runoff relationship. (Knapp-USGS)
W70-03290

AN ALTERNATIVE PHYSICAL APPROACH TO WATERSHED ANALYSIS AND STREAMFLOW ESTIMATION,
New South Wales Univ., Kensington (Australia).
F. C. Bell.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 12, p 86-93, 1967. 8 p, 4 fig, 7 ref.

Descriptors: *Rainfall-runoff relationships, *Streamflow forecasting, *Routing, *Mathematical models, Water storage, Infiltration, Evaporation, Runoff, Runoff forecasting.
Identifiers: Watershed models, Infiltration theory.

The so-called 'infiltration theory' and the associated concepts of surface runoff, interflow and base flow have provided a useful but idealized physical basis for simple flood studies. These ideas are not so suitable for more comprehensive studies of watershed behavior when it is necessary to account for the detailed interrelations between evaporation, precipitation and runoff. An alternative system of watershed concepts is therefore suggested, together with a general 'retention theory' which includes infiltration theory as a special case. Retention theory provides for interrelations between hydrologic processes with mathematical expressions of 'watershed condition' and 'watershed function'. The general mathematical forms of these expressions are consistent with current physical knowledge but could be modified, if necessary, by future advances in knowledge. The specific forms of the watershed functions reflect the relevant physical characteristics of individual watersheds. Their degree of approximation or simplification in a particular problem may be governed by the nature of the problem and the amount of information available. (Knapp-USGS)
W70-03291

THRESHOLD CONSIDERATIONS AND THEIR GENERAL IMPORTANCE FOR HYDROLOGIC SYSTEMS INVESTIGATION,
Institute for Water Resources Research, Berlin (East Germany).
Alfred Becker.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 13, p 94-102, 1967. 9 p, 4 fig, 2 ref.

Descriptors: *Rainfall-runoff relationships, *Model studies, *Mathematical models, *Water storage, Rainfall disposition, Retention, Infiltration, Soil water, Groundwater, Aquifers, Recharge.
Identifiers: Watershed models.

The total water storage volume of a catchment including storage in soil and aquifers can be replaced in a model by a uniform storage layer covering the whole catchment, with storage characteristics an average of the catchment. For uniform precipitation conditions in the model catchment, threshold concepts are approximately valid. Even if rainfall distribution is known for all possible conditions, rainfall-runoff-relations generally deviate from the model catchment relations. These deviations are a measure of the hydrological inhomogeneity of the natural catchments. (Knapp-USGS)
W70-03292

FLOOD FORECASTING IN THE RIVER KITAKAMI,
Tohoku Univ., Sendai (Japan). Hydraulic Engineering Lab.
Toshio Iwasaki.
French synopsis included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 14, p 103-112, 1967. 10 p, 6 fig.

Descriptors: *Rainfall-runoff relationships, *Flood forecasting, *Model studies, *Analog models, Analog computers, Rainfall disposition, Routing, Hydrograph analysis, Unit hydrographs, Runoff forecasting.
Identifiers: *Japan, Kitakami River, Watershed models.

Most river reaches in Japan are very short compared to those in continents, and high stages appear at their downstream ends during rainfall. Flood forecasting is difficult because runoff must be estimated simultaneously with computation of the unsteady flow running down the river. Analog simulations were specially designed for this purpose. Precipitation data are recorded on punched tape. Photoelectric methods are used to convert the digital data to analog, and lag circuits of the second order are used to calculate runoff by the unit graph method. Flood forecasting was successful in the River Kitakami, and the method may be used for the flood prediction of other rivers. Total time for the calculation was only three minutes. (Knapp-USGS)

W70-03295

THE CHEMICAL AND PHYSICAL PARAMETERS IN A HYDROLOGIC TRANSPORT MODEL FOR RADIOACTIVE AEROSOLS,
Stanford Univ., Calif. Dept. of Civil Engineering.
Dale D. Huff, and Paul Kruger.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 17, p 128-135, 1967. 8 p, 15 ref. USPHS Grant ES-00047-03.

Descriptors: *Rainfall-runoff relationships, *Model studies, *Mathematical models, *Runoff forecasting, *Synthetic hydrology, Tracers, Strontium radioisotopes, Cesium, Simulation analysis, Hydrograph analysis, Aerosols, Precipitation (Atmospheric).
Identifiers: Watershed model, Cesium radioisotopes.

The Stanford Watershed Model IV has been successful in reproducing the continuous outflow hydrographs in over 40 watersheds by digital simulation of the hydrologic processes. Additions to this Model are being made to include the simulation of the transport of specific radioactive aerosols through the watershed. Subroutines for the IBM 7090 computer program are being developed to evaluate the chemical and physical parameters in the elements of hydrologic aerosol transport. A discussion of the important transport element subroutines, which include deposition, vegetal interception, soil surface interactions, and channel transport, is given for the important radiotracer elements strontium and cesium. (Knapp-USGS)
W70-03296

A PARTICULAR STOCHASTIC PROCESS AS APPLIED TO HYDROLOGY,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
Petar Todorovic, and Vujica Yevjevich.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 39, p 298-305, 1967. 8 p, 3 fig, 7 ref.

Descriptors: *Rainfall disposition, *Groundwater movement, *Bed load, *Mathematical models, *Stochastic processes, Probability, Markov processes, Synthetic hydrology, Statistical methods, Statistical models.
Identifiers: Hydrologic models (Statistical).

A particular stochastic process of nondecreasing sample functions is adjusted for application in hydrology. Three examples are discussed regarding such applications; namely, the rainfall phenomena, the groundwater diffusion problem and the movement of bedload particles. Because all three phenomena may be conceived as discrete steps of one-directional random movement of a point along a straight line, these applications meet the basic conditions for the stochastic process described. RIVER RUNOFF AS A STOCHASTIC PROCESS, AND ITS MATHEMATICAL MODELLING,
Gruzinskii Politekhnicheskii Institut, Tiflis (USSR).
G. G. Svanidze.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 43, p 329-336, 1967. 8 p, 15 ref.

Descriptors: *Runoff forecasting, *Streamflow forecasting, *Statistical methods, Probability, Markov processes, Stochastic processes, Mathematical models, Statistical models, Simulation analysis, Synthetic hydrology.
Identifiers: Watershed models.

River runoff is viewed as a stochastic process, the only realization of which is an observed hydrological series. Presented are some possible mathematical models of runoff with discrete and with continuous time. A method is here set forth for the modelling of hydrological series with the aid of orthogonal expansions. This has some advantages over the existing methods of modelling; in particular, it enables an immediate setting up of continuous realizations of runoff, under the assumption that the process is not a Markovian one. A STOCHASTIC CONSIDERATION ON VARIATION OF HYDROLOGIC QUANTITIES,
Kyoto Univ. (Japan). Disasters Prevention Research Inst.
Mutsumi Kadoya.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 44, p 337-343, 1967. 7 p, 8 fig, 3 ref.

Descriptors: *Streamflow forecasting, *Rainfall-runoff relationships, *Statistical methods, Mathematical models, Statistical models, Stochastic processes, Markov processes, Simulation analysis, Synthetic hydrology, Time series analysis.
Identifiers: Watershed models.

A serious problem for hydraulic planning is determination of whether or not, in the sequence of hydrologic quantities, cyclic or periodic variations exist. The general character of the long-term variations in the sequences of annual sum and annual maximum of daily precipitation and of river runoff in Japan are examined using the technique of overlapping moving average. The secular variations of hydrologic quantities of short duration, such as the annual maximum daily precipitation, seem to be more random than those having the average characteristics of long duration, such as the annual sum of precipitation. The possibility or the limit of stochastic prediction for the sequential variations of hydrologic quantities by the technique of time series analysis is considered. Because the possibility of prediction is governed mainly by the power of the singular variations in the sequence, the simulation technique should be adopted in order to involve the character of secular variations of hydrologic quantities in hydraulic planning. EVALUATION AND APPLICAON OF A DIGITAL HYDROLOGIC SIMULATION MODEL,
Clemson Univ., S.C. Water Resources Research Inst.
James T. Ligon, Albert G. Law, and Donald H. Higgins.
Available from the Clearinghouse as PB-189 290, $3.00 in paper copy, $0.65 in microfiche. Completion Report, South Carolina Water Resources Research Institute, Clemson Univ, Report No. 12, Nov 1969. 120 p, 26 fig, 1 plate, 4 tab. 12 ref, 5 append. OWRR Project A-010-SC.

Descriptors: *Hydrologic models, *Simulation, Soil moisture, Groundwater, Runoff, Infiltration, Evapotranspiration.
Identifiers: *Piedmont, *Stanford Watershed Model, Digital computer model.

A detailed analysis of the University of Kentucky version of the Stanford Watershed Model III is reported along with comparisons with Model IV. During the analysis certain errors were noted and corrected, and the source and validity of certain hydrologic functions were investigated. The model was tested on a 561-acre Piedmont watershed located near Clemson, South Carolina, for which several years of extensive hydrologic data were available. Model parameters were varied to observe their effects on model output and attempts were made to optimize these parameters. The model simulated annual stream flows quite well, monthly flows reasonably well, but daily flows and individual storm hydrographs were less satisfactory. The model as presently constituted does not incorporate a satisfactory soil moisture-groundwater relationship for this Piedmont watershed. Future studies will be concerned with improved simulation of this relationship.

ANALYSIS OF GROUNDWATER FLOW AND RAINFALL LOSS,
Kyoto Univ. (Japan). Disasters Prevention Research Inst.
Mutsumi Kadoya.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 24, p 177-184, 1967. 8 p, 7 fig, 6 ref.

Descriptors: *Natural recharge, *Surface-groundwater relationships, *Infiltration, Groundwater movement, Soil water movement, Evapotranspiration, Water loss, Runoff, Rainfall-runoff relationships.
Identifiers: Japan.

A theoretical method for the estimation of the groundwater flow and the rainfall loss in a small mountain stream is described. There is a simple relation between the infiltration capacity and the soil-moisture ratio in the surface layer of a drainage basin, defined by the saturated soil-moisture ratio, the hygroscopic coefficient, and the upper and lower limits of infiltration capacity. The equation derived for the infiltration capacity can be used for the recharge capacity. Recharge of groundwater occurs only if the soil-moisture ratio in the surface layer equals or exceeds the maximum capillary water capacity. A simple relation exists between the evapotranspiration and the soil-moisture ratio in the surface layer of the basin. The depth of an imaginary surface layer related to the recharge capacity equals the actual depth related to evapotranspiration. (Knapp-USGS)

PALEOHYDROLOGY: APPLICATION OF MODERN HYDROLOGIC DATA TO PROBLEMS OF THE ANCIENT PAST,
Colorado State Univ., Fort Collins. Dept. of Geology; and Geological Survey, Fort Collins, Colo.
S. A. Schumm.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 25, p 185-193, 1967. 9 p, 4 fig, 1 tab, 22 ref.

Descriptors: *Paleohydrology, *Rivers, *Runoff, *Sedimentation, Regime, Rainfall, Vegetation effects, Floods, Sediment yield, Surface waters, Weathering, Erosion, Climates, Weather.

The relationships between precipitation, temperature, runoff, and sediment yield can be used to theorize on the manner in which ancient rivers responded to modification of their hydrologic regimen due to climate change. During the last few million years of earth history, vegetation was much as it is today within a given climatic environment, and the hydrologic relationships of the present can be applied directly to this portion of geologic time. However, when the surface of the earth was a phytological desert, that is, before the appearance of land vegetation and also during the colonization of the earth's surface by evolving vegetation, the character of the surface water portion of the hydrologic cycle would have been very different from that of the present. Great floods must have been more frequent with sediment yield rates being limited only by the erodibility and weathering characteristics of rocks. It is suggested herein that the hydrologist can contribute to a better understanding of these past environments and, thereby, to the solution of some puzzling geologic problems. (Knapp-USGS)

THE SIMULATION OF INFILTRATION FOR STUDIES IN OVERLAND FLOW,
Melbourne Univ., Parkville (Australia). Dept. of Agricultural Engineering.
G. A. Jobling, and A. K. Turner.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 27, p 203-210, 1967. 8 p, 7 fig, 3 ref.

Descriptors: *Rainfall-runoff relationships, *Overland flow, *Model studies, *Hydraulic models, *Simulated rainfall, Simulation analysis, Artificial precipitation, Rainfall simulators, Runoff forecasting, Routing.
Identifiers: Watershed models.

'Overland flow' over natural surfaces is unsteady and spatially varied, due to both rainfall and infiltration. Most experimental work to date has been done using impermeable surfaces, the effects of time-dependent infiltration being ignored. Research into flows over natural surfaces is time consuming and the results are difficult to interpret at this stage in our knowledge of such flows. A method of simulating infiltration is described which enables experimental work to be undertaken in a tilting flume. The system produces a time-dependent decay in simulated infiltration, and can be described by an equation of the form used by Kostiakov. Since the two parameters involved can be readily altered, the system provides a means of simulating a range of field surfaces. Some initial results using the method are described. (Knapp-USGS)

SOME MEASUREMENTS OF THE TRITIUM CONTENT IN THE NATURAL WATER OF SOUTHERN OAHU, HAWAII,
Hawaii Univ., Honolulu. Water Resources Research Center.
Theodorus H. Hufen, Robert A. Duce, and L. Stephen Lau.
Available from the Clearinghouse as PB-189 406, $3.00 in paper copy, $0.65 in microfiche. Technical Report No 34, Completion Report, Hawaii Water Resources Research Center, Nov 1969. 32 p. OWRR Project A-016-HI.

Descriptors: *Tritium, *Hawaii, Rainwater, Groundwater.
Identifiers: *Oahu (Hawaii).

An analysis was made of the tritium content of samples from various sources of surface and subsurface waters of the island of Oahu. Twenty rainwater samples collected from various rain gages located on the Koolau Range over a period of four months showed an activity between 16.3 and 28.2 tritium units. Samples from four streams in the Pearl Harbor area ranged from 14.5 to 21.3 tritium units, while samples from two springs and five wells in this same area all showed an activity below 5 tritium units. The instrumentation consisted of an electrolysis enrichment apparatus, a vacuum distillation unit and a liquid scintillation counter. A detailed description is given of the various parts of the electrolysis apparatus and the vacuum distillation unit. Both the enrichment and counting procedures are reviewed as well as the calibration of these systems.

GENERALIZING DRY-DAY FREQUENCY DATA,
Agricultural Research Service, Beltsville, Md. Hydrograph Lab.
David M. Hershfield.
Journal of American Water Works Association, Vol 62, No 1, p 51-54, Jan 1970. 4 p, 6 fig, 4 tab, 5 ref.

Descriptors: *Probability, *Droughts, *Precipitation (Atmospheric), Weather, Climates, Forecasting, Statistical methods, Weather forecasting, Estimating, Frequency analysis.
Identifiers: Dry-day sequences, Dry-day forecasting.

A statistical procedure is presented for calculating the probability of dry-day sequences up to 20 days in length. Mean annual dry period frequencies, probabilities, and lengths in the eastern and central U. S. are shown on maps. The procedure requires information on the mean annual number of days with precipitation above a selected threshold. Use of the cumulative form of the geometric distribution as given will provide the probability, P, of obtaining a dry period of a particular length, k. For rarer return periods (longer dry periods), say, greater than 20 days, the extreme-value procedure appears to be satisfactory. (Knapp-USGS)

Identifiers: *Tropical rainfall, South America.

The rainfall pattern, the seasonal changes of rainfall, the variation of rainfall, and an analysis of the areal coefficient of association of rainfall were studied in Guayana and Surinam. Some movement of rains to the south were observed in Colombia (about 20 miles per day). A study of daily rainfall in interior Colombia included establishing the size and location of principle mesoscale systems on individual days. The method of extreme value distribution has been applied to some rainfall data from Venezuela. The analysis shows that in nearly all cases it is possible to use the asymptotic distribution. A method of areal presentation is derived and presented. The general problem of rainfall trends is investigated by the use of the single-runs test and simple linear regression. No significant trends for stations in Guayana and Surinam were found. Excellent correlation exists between occurrences of high sea temperatures in Peru (El Nino phenomena) and excessive rainfall. A zonification according to seasonal distribution of rainfall provides information about existing regions of uniform distribution and the approximate position of the intertropical convergence zone across Western Colombia. Associations of annual rainfall were generally low, with only a few limited areas displaying moderate to high association values. (Knapp-USGS)

RESEARCH ON TROPICAL RAINFALL PATTERNS AND ASSOCIATED MESOSCALE SYSTEMS: PART A. RAINFALL PATTERNS IN GUAYANA AND SURINAM,
Texas A and M Univ., College Station. Dept. of Meteorology.
Walter K. Henry.
US Army Electronics Command Research and Development Technical Report ECOM-02313-S2, p 1-13, Oct 1967. 13 p, 7 fig.

Descriptors: *Rainfall, *Rainfall disposition, *Weather patterns, *Meteorology, *Synoptic analysis, Climatology, Precipitation (Atmospheric), Storms, Tropical cyclones, Weather.
Identifiers: *Guayana, *Tropical rainfall.

The rainfall patterns of Guayana and Surinam are complex. However, the terrain is not as much of a cause of the rainfall variation as in other areas. The variations from station to station are pronounced as shown by all criteria. Also, the synoptic feature which causes the December rains along the coast does not extend its effects more than 200 miles inland. (Knapp-USGS)

RESEARCH ON TROPICAL RAINFALL PATTERNS AND ASSOCIATED MESOSCALE SYSTEMS: PART B. MOVEMENT OF MESOSCALE SYSTEMS IN COLOMBIA,
Texas A and M Univ., College Station. Dept. of Meteorology.
Walter K. Henry.
US Army Electronics Command Research and Development Technical Report ECOM-02313-S2, p 14-20, Oct 1967. 7 p, 3 fig.

Descriptors: *Rainfall, *Rainfall disposition, *Weather patterns, *Meteorology, *Synoptic analysis, Climatology, Precipitation (Atmospheric), Storms, Tropical cyclones, Weather.
Identifiers: *Colombia, *Tropical rainfall.

An attempt to trace the movements of rainstorms in Colombia by using three-day running totals of daily rain was partially successful. Rainy periods were well identified. In a few cases, movement toward the south was identified and a rate of about 20 miles a day established. This rate is about the same as was established by previous investigations. From the differing amounts of rainfall, it is apparent that the systems were not active at all times. (Knapp-USGS)
W70-03481

RESEARCH ON TROPICAL RAINFALL PATTERNS AND ASSOCIATED MESOSCALE SYSTEMS: PART C. DAILY RAINFALL IN INTERIOR COLOMBIA,
Texas A and M Univ., College Station. Dept. of Meteorology.
Walter K. Henry.
US Army Electronics Command Research and Development Technical Report ECOM-02313-S2, p 21-37, Oct 1967. 17 p, 11 fig, 1 tab.

Descriptors: *Rainfall, *Rainfall disposition, *Weather patterns, *Meteorology, *Synoptic analysis, Climatology, Precipitation (Atmospheric), Storms, Tropical cyclones, Weather, Topography.
Identifiers: *Colombia, *Tropical rainfall.

The rainfall patterns in interior Colombia are greatly influenced by the rugged terrain. A study of daily rainfall was made in the month of April 1962. April is the beginning of the rainy season. It was selected so that the arrival of the rains could be observed. The entire area had only scattered light showers between the 7th and the 18th. From the 18th to the end of the month there was only one day which at least half the stations did not receive some rain. On the 21st, which was the rainiest day, 12 stations did not receive any rain. The stations in wide valleys receive much less rain than do those on the mountain sides. In narrow valleys the system is large enough to extend over, or even across, the valley. Mesoscale systems are smaller on the Bogota plateau than in the lowlands. If a systematic movement of mesoscale systems exist in the mountain areas of Colombia, it has not yet been identified. (Knapp-USGS)

RESEARCH ON TROPICAL RAINFALL PATTERNS AND ASSOCIATED MESOSCALE SYSTEMS: PART D. NORMALITY OF RAINFALL DISTRIBUTIONS,
Texas A and M Univ., College Station. Dept. of Meteorology.
John F. Griffiths.
US Army Electronics Command Research and Development Technical Report ECOM-02313-S2, p 38-67, Oct 1967. 30 p, 4 fig, 3 tab.

Descriptors: *Rainfall, *Rainfall disposition, *Weather patterns, *Meteorology, *Synoptic analysis, Statistical methods, Climatology, Precipitation (Atmospheric), Storms, Tropical cyclones, Weather, Topography.
Identifiers: *Guayana, *Surinam, *French Guiana, Tropical rainfall.

About 90% of the station rainfall data in Guayana, Surinam, and French Guiana exhibit a square-root-normal distribution while about the same percentage exhibit a normal distribution of annual amounts. Areal analysis of non-normally distributed station-months may provide important clues to regions which should receive special synoptic studies. In general, normality (of absolute numbers or their square roots) of the data may be assumed but there are groups of abnormal stations near New Amsterdam and Paramaribo. (Knapp-USGS)

RESEARCH ON TROPICAL RAINFALL PATTERNS AND ASSOCIATED MESOSCALE SYSTEMS: PART E. EXTREME VALUE ANALYSIS IN VENEZUELA,
Texas A and M Univ., College Station. Dept. of Meteorology.
John F. Griffiths.
US Army Electronics Command Research and Development Technical Report ECOM-02313-S2, p 68-81, Oct 1967. 14 p, 8 fig, 1 tab.

Descriptors: *Rainfall, *Rainfall disposition, *Weather patterns, *Meteorology, *Synoptic analysis, Statistical methods, Climatology, Precipitation (Atmospheric), Storms, Tropical cyclones, Weather, Topography.
Identifiers: *Venezuela, *Extreme value analysis, Tropical rainfall.

An extreme value analysis was made of the records from 15 stations in Venezuela. For these stations the highest amount of daily rainfall recorded in each month for the whole period of record was extracted. Some of the extremely high values are rather dubious; comparison with neighboring stations gives rise to a suspicion that the value given for one day is actually a composite of many days. For each month for each station, plots were made of the resulting points on extreme probability graph paper. Lines of best fit were then drawn for these points and from the resulting line the values of the precipitation corresponding to the 0.30 and 0.90 probability levels were extracted. Extreme (30% and 90% values are tabulated and shown by contour maps. (Knapp-USGS)
W70-03484

RESEARCH ON TROPICAL RAINFALL PATTERNS AND ASSOCIATED MESOSCALE SYSTEMS: PART F. TRENDS IN THE RAINFALL,
Texas A and M Univ., College Station. Dept. of Meteorology.
John F. Griffiths.
US Army Electronics Command Research and Development Technical Report ECOM-2313-S2, p 82-86, Oct 1967. 5 p, 3 tab.

Descriptors: *Rainfall, *Rainfall disposition, *Weather patterns, *Meteorology, *Synoptic analysis, Statistical methods, Climatology, Precipitation (Atmospheric), Storms, Tropical cyclones, Weather
Identifiers: *Venezuela, *Tropical rainfall.

Swed-Eisenhart and linear regression analyses were used to test for long term precipitation and climatic trends in the Guianas. Except for 2 stations with possible trends, no trends could be found. For Guayana and Surinam, no trends are shown by the statistical analyses. (Knapp-USGS)
W70-03485

RESEARCH ON TROPICAL RAINFALL PATTERNS AND ASSOCIATED MESOSCALE SYSTEMS: PART H. AN ANALYSIS OF THE DISTRIBUTION OF RAINFALL AND SOME RAINFALL ASSOCIATIONS FOR SELECTED STATIONS IN WESTERN COLOMBIA,
Texas A and M Univ., College Station. Dept. of Meteorology.
David G. Morris.
US Army Electronics Command Research and Development Technical Report ECOM-2313-S2, p 104-155, Oct 1967. 52 p, 26 fig, 1 tab, 16 ref, append.

Descriptors: *Rainfall, *Rainfall disposition, *Weather patterns, *Meteorology, *Synoptic analysis, Statistical methods, Climatology, Precipitation (Atmospheric), Storms, Tropical cyclones, Weather.
Identifiers: *Colombia, *Tropical rainfall.

The seasonal distribution of rainfall is uniform within broad, well defined areas of Western Colombia. The map of mean annual rainfall shows definite synoptic-scale patterns in some areas, with the most significant being the Pacific western coast and the eastward intrusion across the northern terminus of the Cordilleras. The variability of annual totals is generally greatest in higher, drier elevations, with lower areas showing standard deviations on the order of 200 mm and 400 mm. Rainfall variability increases or decreases greatly over small distances in rugged terrain. Generally, there is little association in the annual rainfall except in small areas. Relatively small changes in topography greatly alter the rainfall patterns. Rainfall patterns east of the Cordillera Occidental are not associated with the rains of the Pacific west coast. (Knapp-USGS)

Available from the Clearinghouse as PB-189 402, $3.00 in paper copy, $0.65 in microfiche. Idaho Univ Water Resources Res Inst Tech Completion Rep, Sept 1968. 68 p, 30 fig, 3 tab, 1 append. OWRR Proj No A-012-IDA.

Descriptors: *Climatology, *Microclimatology, *Micrometeorology, *Idaho, *Precipitation (Atmospheric), Temperature, Humidity, Meteorology, Storms, Topography, Weather, Weather data, Data collections.
Identifiers: *Snake River Canyon (Idaho), Clearwater Mountains (Idaho).

Temperature and relative humidity records have been kept at a maximum of 18 sites, and precipitation records at 8 sites, along a 75-mile profile between Wawawai, Washington, elevation 675 ft in the Snake River Canyon, and Crater Peak, elevation 6400 ft in the Clearwater Mountains, Idaho. The most distinctive microclimatic feature is the extreme development of nocturnal temperature inversions during summer and early autumn. Mean inversions between non-contiguous hilltops and bottomlands may reach 20 to 30 deg. Greatest recorded on a specific day has been 42 deg. Mean temperatures, length of frost-free season, nocturnal relative humidities, natural vegetation, and land use are all strongly influenced by these inversions. None of the 6 official Weather Bureau stations in the vicinity of the profile is located to show these inversions. Diurnal temperature and relative humidity patterns differ greatly at individual sites along the profile and are analyzed and compared. Precipitation normally varies by a factor of at least 3 1/2 along the profile, but may reach several times this value during individual months. Maximum snow depths range from none at Wawawai to 14 ft at Lost Lake near Crater Peak during specific snow seasons. (Knapp-USGS)

EXPERIMENTS ON HALINE CONVECTION INDUCED BY THE FREEZING OF SEA WATER,
Yale Univ., New Haven, Conn.
Theodore D. Foster.
Journal of Geophysical Research, Vol 74, No 28, p 6967-6974, Dec 20, 1969. 8 p, 9 fig, 1 tab, 9 ref. ONR Contract No N00014-67-A-0097-0001.

Descriptors: *Sea water, *Salinity, *Convection, *Freezing, *Density currents, Laboratory tests, Mathematical studies, Thermal conductivity, Diffusion, Mixing, Analytic techniques, Instrumentation, Cooling, Water temperature, Currents (Water), Photography, Eddies.
Identifiers: Haline convection.

Laboratory experiments were performed in which sea water was frozen from above at controlled rates. The resulting haline convection was observed by using a schlieren optical system. Salinity of the sea water was varied from about 20 to 35 parts per thousand. Freezing rates up to about 0.00015 g/sq cm sec were used. The resultant salt fluxes varied from about 0.0000002 to 0.000002 g/sq cm sec. The haline convection took the form of long vertical filaments with a horizontal spacing of 0.2 to 0.3 cm, in good agreement with the predictions of linear theory. (Gabriel-USGS)

Available from the Clearinghouse as PB-184 791, $3.00 in paper copy, $0.65 in mress Report to Environmental Science Services Administration from

Wisconsin University, May 1969. 42 p, 9 fig, 1 tab, 28 ref. ESSA Grant E-287-68 (G).

Descriptors: *Evapotranspiration, *Water loss, *Drainage, Water balance, Hydrologic budget, Darcys law, Infiltration, Evaporation, Runoff, Lysimeters, Soil-water-plant relationships, Soil water movement, Water storage.
Identifiers: Potential evapotranspiration, Soil water evaporation.

Water loss from soils supporting vegetation is due to either evapotranspiration or drainage. Means of calculating both of these components of the hydrologic balance were investigated using primary climate, soil, and plant parameters. Evapotranspiration was found by treating separately the processes of transpiration from vegetation and evaporation from the soil. The model was tested on a snap bean crop in which two drying cycles restricted evapotranspiration severely. The calculated evapotranspiration was 102 mm whereas 98 mm was measured. As much as 30% relative error was found when the soil was dry, but the absolute error was only 0.3 mm. Inaccuracy was due mainly to inaccurate estimates of evaporation from the soil. Drainage from the root zone of the snap beans grown on a sandy soil was measured in three ways: by Darcy's law, by a lysimeter, and by the hydrologic balance. Darcy's law gave a 13% higher estimate than the other two methods, which agreed well with each other. (Knapp-USGS)

LONGITUDINAL SLOPE CHARACTERISTICS OF RIVERS OF THE MIDCONTINENT AND THE ATLANTIC EAST GULF SLOPES,
Geological Survey, Washington, D.C.
Charles W. Carlston.
Bulletin of the International Association of Scientific Hydrology, Vol 14, No 4, p 21-31, Dec 1969. 11 p, 4 fig, 4 ref.

Descriptors: *Channel morphology, *Profiles, *Mississippi River, *Missouri River, *Ohio River, Geomorphology, Erosion, Sedimentation, Regime, Terracing, Channels, Beds.
Identifiers: River profiles.

Study of longitudinal stream profiles of rivers of the Midcontinent (rivers tributary to the Mississippi) and Atlantic and East Gulf Slopes has revealed five types of longitudinal profiles: (1) Overall concave-upward profiles with or without long constant slope segments; (2) convex upward (the Missouri River has a profile that has a constant slope for its lower 560 miles and then is convex upward to a point beyond the Yellowstone River junction); (3) concave-upward irregular, ungraded, low-gradient profiles (Ohio and Tennessee Rivers); (4) irregular unsegmented and steep profiles, such as shown by the Delaware and Savannah-Tugaloo Rivers; and (5) irregular ungraded, steep-gradient profiles that are concave-upward in the upstream reaches and downstream convex-upward, for example, on most of the Atlantic Slope and East Gulf Slope Rivers above the Fall Line. Constant slope profiles occur where the last type of rivers flow across relatively weak Coastal Plain sediments and also inland on the Coosa and Oostanaula-Conasauga Rivers. The profile characteristics of the Atlantic and East Gulf streams lend support to the hypothesis of multiple erosion cycles in the Appalachians. (Knapp-USGS)

MINERAL AND WATER RESOURCES OF ARIZONA: PART 2. WATER RESOURCES; AND PART 3. WATER RESOURCE DEVELOPMENT,
Geological Survey, Tucson, Ariz.; and Bureau of Reclamation, Phoenix, Ariz.
J. J. Ligner, Natalie D. White, L. R. Kister, and M. E. Moss.
Report available for sale by Arizona State Bur of Mines, Ariz Univ, Tucson, Ariz- Price $3.00. Arizona State Bureau of Mines Bulletin 180, p 469-638, 1969. 170 p, 34 fig, 38 tab, 108 ref.

Descriptors: *Water resources, *Groundwater, *Surface waters, *Water supply, *Arizona, Water yield, Water utilization, Irrigation water, Overdraft, Water levels, Streamflow, Water level fluctuations, Withdrawal, Reservoirs, Reservoir yield, Hydroelectric power, Data collections, Hydrologic data, Water rights.
Identifiers: Water availability (Ariz).

Factual information about Arizona's present water supplies and supplies available for future exploitation is compiled in a summary of the State's mineral and water resources. The physical environment and water provinces of the State are described, followed by descriptions of the water resources under each respective water province, by province subdivision, or area. Summary information is presented in maps, graphs, and tables. Also included are brief sections that present discussions of the potential waterpower, and geothermal resources. Water resource developments and potential water resource developments, water conservation practices, and various research programs on water conservation are discussed. (Knapp-USGS)

MEAN STREAMFLOW FROM DISCHARGE MEASUREMENTS,
Geological Survey, Washington, D.C.
H. C. Riggs.
Bulletin of the International Association of Scientific Hydrology, Vol 14, No 4, p 95-110, Dec 1969. 16 p, 12 fig, 6 tab, 3 ref.

Descriptors: *Streamflow, *Average flow, *Stream gages, *Discharge measurement, *Estimating, Statistical methods, Gaging stations, Rainfall-runoff relationships, Runoff, Hydrographs, Routing, Stage-discharge relations, Data processing.
Identifiers: Streamflow estimating.

Mean flow of a stream is usually computed from a continuous record of flow at a gaging station. A less costly method consists of (1) estimating 12 individual monthly flows from one discharge measurement per month and a concurrent gaging station record on a nearby stream, using a different relation for each month, (2) computing the annual mean from the estimated monthly means, and (3) using a relation based on gaging station records to estimate the long-term mean from the one annual mean. An annual mean can be estimated within about 10% of its measured value even though both the gaged and ungaged streams are affected by diversions and have different runoff characteristics. The method has greatest utility in regions where mean runoff is not closely related to drainage area. (Knapp-USGS)

FLOW ROUTING BY DIRECT INTEGRATION METHOD,
Department of Energy, Mines and Resources, Toronto (Ontario). Conservation Authorities Branch.
J. Y. Ding.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 15, p 113-120, 1967. 8 p, 3 fig, 1 tab, 8 ref.

Descriptors: *Rainfall-runoff relationships, *Routing, *Flood routing, *Mathematical models, Hydrograph analysis, Unit hydrographs, Overland flow, Water storage, Infiltration, Open channel flow.
Identifiers: *Kinematic wave theory, Watershed models.

A flow routing equation is developed from the continuity equation in the form of the hydrologic equation and a simplified dynamic equation expressed by a general storage-discharge relation. Flow routing thus becomes the solution of kinematic-wave problems. The solution of the routing equation is simplified by using the table of the varied-flow functions, F (u,n), where n is the storage exponent and u is the n-th root of the ratio of outflow to inflow. When inflow is zero, the routing equation can be linearized. For a number of storage elements, the value of the storage exponent, n, is found to vary from 1/2 for orifice to 3 for laminar overland flow. Examples of flow routing are given, with emphasis on Izzard's overland flow hydrographs. It is shown that Izzard's dimensionless hydrograph can be derived from the condition of unsteady laminar varied flow. Several concepts in hydrology are derived mathematically from the routing equation, and a critique of routing methods is presented. (Knapp-USGS)

COMPARISON OF COMPUTED AND OBSERVED FLOOD ROUTING IN A CIRCULAR CROSS-SECTION,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
Albert H. Barnes.

French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 16, p 121-127, 1967. 7 p, 3 fig, 1 tab, 2 ref.

Descriptors: *Flood routing, *Rainfall-runoff relationships, *Storm drains, *Closed conduit flow, Rational formula, Mathematical models, Digital computers, Simulation analysis, Drainage systems.
Identifiers: Drainage system design.

The numerical solution to the dynamic equations representing unsteady flow have been compared with experimentally observed values taken from a carefully conducted experiment and found to compare favorably within the range of observations. A numerical solution to the hyperbolic partial differential equations expressed unsteady flow, commonly referred to as flood routing, has been accomplished in several different ways. The method utilizing a second-order interpolation commonly referred to as the Lax-Wendroff method, has produced the most nearly stable results. The method of characteristics and the diffusing method of numerical integration have been investigated and have shown to offer no advantage over the Lax-Wendroff method. Experimental observations were conducted in a 3-ft diameter pipe, 822-ft long, with discharges ranging from approximately 5 cfs to approximately 70 cfs, with hydrographs of one to two-min durations. Depth hydrographs were observed at 6 points along the conveyance channel and computed for the same positions. Agreement between computed and observed was within about 5 percent in general. The developed numerical procedure and the digital computer will not provide a basis for improved design of storm drainage systems. (Knapp-USGS)

EXTENT AND FREQUENCY OF INUNDATION ON THE PERKIOMEN CREEK FLOOD PLAIN FROM GREEN LAND RESERVOIR TO THE SCHUYLKILL RIVER (NEAR OAKS, PENNSYLVANIA),
Geological Survey, Harrisburg, Pa.
William F. Busch.
Geological Survey Open-file Report, June 1969. 27 p, 9 fig, 3 plate, 3 tab, 12 ref.

Descriptors: *Floods, *Pennsylvania, *Non-structural alternatives, Mapping, Profiles, Hydrographs, Hydrologic data, Data collections, Stage-discharge relations, Streamflow, Flood forecasting, Flood damage, Flood protection, Flood plains.
Identifiers: *Perkiomen Creek, *Oaks (Penn).

Information is presented relative to the extent, depth, and frequency of floods on Perkiomen Creek, Oaks, Pennsylvania from Green Lane Reservoir to the mouth, a reach of 20.4 miles. The depth, extent, and frequency of flooding can be estimated for any site along the reach of the Perkiomen Creek under study. Flood data and the evaluation of the data are presented so that local and regional agencies, organizations, and individuals may have a technical basis for making decisions on the use of flood-prone areas. Flood-plain inundation studies, when followed by appropriate land-use regulations, are a valuable and economical supplement to physical works for flood control. Both physical works and flood-plain regulations are included in the Comprehensive Plan for development of the Delaware River basin, of which the Perkiomen Creek is a part. (Knapp-USGS)

BASE-FLOW STUDIES OF LEON AND LAMPASAS RIVERS, TEXAS - QUANTITY AND QUALITY, JANUARY 16-17, 1968,
Geological Survey, Austin, Tex
Jack Rawson, and Gerald K. Schultz.
Texas Water Development Board Report 97, June 1969. 9 p, 2 fig, 2 tab, 3 ref.

Descriptors: *Base flow, *Surface-groundwater relationships, *Texas, Streamflow, Groundwater movement, Low flow, Surveys, Rivers.
Identifiers: Lampasas River (Tex), Leon River (Tex).

The purposes of base flow investigation of the Leon and Lampasas Rivers were (1) to determine the quantity of tributary inflow and the amount of interchange of surface and groundwater in the main streams, (2) to relate the nature and concentrations of dissolved constituents in the base flow to geology and to the activities of man, and (3) to evaluate the water for municipal supply, irrigation, and industrial use. Both the Leon and Lampasas Rivers generally gained flow throughout the reaches studied. Flow in the Leon River increased from 4.46 cfs at mile 16.7 to about 58 cfs at mile 0.0, a net gain of 53.5 cfs. During the study, the city of Temple diverted an average of 6.1 cfs from the Leon River. Thus, the gross gain in flow totaled 59.6 cfs. Measured inflow from tributaries was 50.9 cfs, or about 85% of the total gain in mainstream flow. Direct accretions of groundwater in the upper 4.4-mile reach of the mainstream probably accounted for much of the unmeasured gain. The dissolved-solids content of water in the Leon River increased from 253 mg/l at mile 16.7 to more than 400 mg/l. Flow in the Lampasas River increased from 24.6 cfs at mile 15.8 to 112 cfs at mile 0.1, a gain of 87.4 cfs. Measured tributary inflow was 71.5 cfs, or about 82% of the total gain. The concentration of dissolved solids in the Lampasas River decreased from 660 mg/l at mile 15.8 to 385 mg/l at mile 0.1. The base flow in streams throughout the area meets the quality requirements for irrigation and many industrial uses, but water in most streams will require softening for some industrial applications. (Knapp-USGS)

HYDROLOGIC STUDIES OF SMALL WATERSHEDS, COW BAYOU, BRAZOS RIVER BASIN, TEXAS, 1955-64,
Geological Survey, Austin, Tex.
Willard B. Mills.
Texas Water Development Board Report 99, Oct 1969. 66 p, 12 fig, 18 tab, 24 ref.

Descriptors: *Rainfall-runoff relationships, *Small watersheds, *Texas, Hydrographs, Runoff, Streamflow, Data collections, Hydrologic data, Water storage, Evapotranspiration, Hydrologic budget, Water balance.
Identifiers: Cow Bayou (Tex), Brazos River (Tex).

A study was made of the rainfall, inflow, consumption, and outflow for a group of 9 floodwater-detention structures on a 79.6-square-mile watershed near Bruceville, Texas for the 6 water years 1959-64. During this period annual rainfall varied from 19.18 inches in 1963 to 46.73 inches in 1961 as compared to the 32.25-inch long-term average. Total rainfall for the period 1959-64 ranged from 181.8 inches to 200.8 inches on the drainage areas of the 9 floodwater-detention structures. Runoff from these areas, total for the 6-year period, ranged from 22.2 inches to 42.7 inches. Net reduction in pool content during the period was 220 acre-feet, leaving 748 acre-feet in pool storage. A rain-gage density study for the period 1955-64 indicated that 2 rain gages installed at certain points on the watershed would provide data within 8% of the weighted mean rainfall of the 9 existing rain gages using at 67% confidence limit. An average 1-hour unit hydrograph with a 5-hour time of rise and 10,400 cfs peak was developed for the watershed (Knapp-USGS)
W70-03467

THE MECHANISM OF DIRECT SURFACE RUNOFF FROM RAINFALL,
Oklahoma State Univ., Stillwater. Dept. of Agricultural Engineering.
Charles E. Rice
Oklahoma Water Resources Research Institute. Partial Technical Completion Report, 1968. 9 p, 4 fig, 1 ref. OWRR Proj No A-006-OKLA.

Descriptors: *Rainfall-runoff relationships, *Overland flow, *Routing, *Model studies, *Hydraulic models, Laminar flow, Turbulent flow, Steady flow, Non-uniform flow, Roughness (Hydraulic).
Identifiers: Grass (Synthetic).

Studies on a synthetic grass material used to simulate a natural vegetation for overland flow conditions show that two regimes of flow occur, one occurring when the flow depth is less than the height of the grass (assumed as laminar flow) and another occurring when the flow depth is greater than the height of the grass (turbulent flow). Because the synthetic grass occupied a considerable portion of the flow depth the physical bottom was assumed as not being representative of the effective bottom. Thus, for turbulent flow an effective bottom was found as the intercept when water surface elevation was plotted versus discharge to the 0.6 power. The Manning coefficient for the turbulent flow range increased slightly with discharge and its value (average of about 0.032) indicated that the synthetic grass had a high retardance to the flow of water. (Knapp-USGS)

RELATION OF DISCHARGE AND STREAM LENGTH IN EASTERN UNITED STATES,
Antioch Coll., Yellow Springs, Ohio. Dept. of Earth Sciences.
Marie E. Morisawa.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 23, p 173-176. 4 p, 2 tab.

Descriptors: *Streamflow forecasting, *Correlation analysis, *Terrain analysis, Channel morphology, Geomorphology, Runoff forecasting, Statistical methods, Water yield, Discharge (Water).
Identifiers: *Stream length, *Drainage basin morphology.

Correlation of longest stream length and mean annual discharge for 96 watersheds in six different physiographic regions of eastern United States results in correlations indicating that for each region one variable is highly related to the other. The relationship between the two variables is significantly different from region to region; one general equation determined from all data cannot be used for individual regions. However, the statistical validity of the correlations does supply an empirical method which can be used to estimate mean annual discharge in ungaged watersheds within a given region. (Knapp-USGS)

STOCHASTIC DESCRIPTION OF DAILY RIVER FLOWS,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
Rafael G. Quimpo.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 38, p 290-297, 1967. 8 p, 2 fig, 3 tab, 13 ref. NSF Grant GK-169.

Descriptors: *Streamflow forecasting, *Statistical methods, *Correlation analysis, *Stochastic processes, *Markov processes, *Mathematical models, Probability, Time series analysis, Frequency analysis, Synthetic hydrology, Fourier analysis.
Identifiers: Spectral analysis.

A mathematical representation for series of daily streamflows is postulated. The model is made up of a periodic and a stochastic component. The periodic component is applied both to 365 mean daily flows and to 365 standard deviations about these means. Five rivers are used to show the method of approach. First, periodic components were detected, in the daily means, and in standard deviations and isolated by using spectral analysis. Then, autoregressive schemes were fitted to stationary stochastic series after the periodic components had been removed. Finally, stochastic components of these series for all five rivers were found to be well fitted by the second order Markov linear model. (Knapp-USGS)

HYDROLOGIC RECONNAISSANCE OF THE BEAR RIVER BASIN IN SOUTHEASTERN IDAHO,
Geological Survey, Boise, Idaho.
N. P. Dion.
Idaho Department of Reclamation Water Information Bulletin No 13, Oct 1969. 66 p, 14 fig, 7 tab, 22 ref.

Descriptors: *Water resources, *Groundwater, *Idaho, Irrigation water, Water sources, Aquifers, Hydrogeology, Water wells, Water quality, Recharge, Water yield, Water table, Canal seepage, Seepage.
Identifiers: Bear River basin (Idaho).

The areal distribution of precipitation in the Bear River basin, Idaho is controlled chiefly by elevation, and quantities range from less than 10 inches in Bear Lake Valley to more than 45 inches on the Bear River Range. Precipitation on the basin averages about 2.3 million acre-ft per year. Groundwater occurs in the alluvium of all the valleys, the basalt of Soda Creek basin and Gem Valley, the Salt Lake Formation, the fractured bedrock, and possibly in the Wasatch Formation. The basalt and the alluvium are the most productive aquifers in the basin and are best able to withstand additional groundwater development. The basalt yields as much as 3,500 gpm and the alluvium as much as 2,500 gpm to wells. While many wells drilled into the Salt Lake Formation are nonproductive, those that are successful yield as much as 1,800 gpm. The principal sources of recharge to the aquifers include precipitation, spring snowmelt and runoff, seepage of irrigation water, and some leakage of water from Blackfoot Reservoir through the Blackfoot Lava Field into the Bear River basin. (Knapp-USGS)
W70-03254

HYDROGEOLOGY OF A VOLCANIC ISLAND CHE JU DO, KOREA,
Geological Survey of Israel, Jerusalem. Hydrogeological Div.
Yoram Eckstein.
Bulletin of the International Association of Scientific Hydrology, Vol 14, No 4, p 45-60, Dec 1969. 16 p, 9 fig, 4 tab, 12 ref.

Descriptors: *Groundwater, *Water resources, Recharge, Water levels, Basalts, Volcanoes, Permeability, Aquifers, Surveys, Water wells, Climates, Precipitation (Atmospheric).
Identifiers: Che Ju Do (Korea).

Che Ju Do is a volcanic island offshore from the Korean Peninsula. The island is an extinct volcano, petrologically a part of the intra-pacific province of the olivine-basalt-trachyte association. The last volcanic activity has been reported in old manuscripts. Climate of the island is primarily influenced by the Pacific monsoon pattern and the northwest winter Siberian winds. A highly permeable basaltic surface of the mountainous central part of the island, coincident with the highest precipitation in the area, results in good recharge of groundwater. Groundwater appears as perched horizons on impermeable planes between lava flows, but most of the reserves are stored in a basal fresh water lens, which floats upon and displaces the sea water beneath the island. (Knapp-USGS)
W70-03258

BRANCHING-TYPE MODELS OF FLOW THROUGH POROUS MEDIA,
Illinois Univ., Urbana.
K. H. Liao, and A. E. Scheidegger.
Bulletin of the International Association of Scientific Hydrology, Vol 14, No 4, p 137-145, Dec 1969. 9 p, 3 fig, 1 tab, 6 ref.

Descriptors: *Groundwater movement, *Dispersion, Flow, Porous media, Diffusion, Probability, Stochastic processes, Statistical methods, Statistical models, Model studies, Computer models, Fluid mechanics, Hydraulics.
Identifiers: Graph models, Random-graph theory.

A random-graph model is used to explain the mechanics of flow through porous media. The approach is extended to the discussion of a three-dimensional random-graph model and to an investigation of lateral dispersion in porous media. Comparisons with experimental results are given. (Knapp-USGS)
W70-03262

KARSTIC WATER RESEARCH IN HUNGARY,
Research Inst. for Water Resources Development, Budapest (Hungary). Karstic Water Research Section.
T. Bocker.
Bulletin of the International Association of Scientific Hydrology, Vol 14, No 4, p 7-20, Dec 1969. 14 p, 10 fig, 1 tab.

Descriptors: *Karst, *Groundwater movement, Water resources, Mine drainage, Water management (Applied), Reviews, Surveys, Aquifers, Water wells, Springs, Water yield, Withdrawal, Model studies, Analog models.
Identifiers: *Hungary.

Hungarian research on karst phenomena is reviewed. In Hungary, about 40% of coal production, all bauxite production, and all manganese production are from mines below the karstic water level. Mine drainage and the danger of flooding by karstic water are important subjects of research. Volumes pumped and spring flow are tabulated. Drawdown caused by pumping is mapped and briefly discussed. Model tests are used to predict effects of withdrawal. (Knapp-USGS)

A STUDY ON THE RECESSION ON UNCONFINED AQUIFERS,
C. Venetis.
Bulletin of the International Association of Scientific Hydrology, Vol 14, No 4, p 119-125, Dec 1969. 7 p, 1 fig, 3 ref.

Descriptors: *Aquifers, *Drawdown, *Mathematical models, Recharge, Discharge (Water), Water level fluctuations, Groundwater movement, Water table, Withdrawal.
Identifiers: Unconfined aquifers.

The dependence of recession of the groundwater levels and groundwater discharge upon the initial state of the aquifer is examined for deep unconfined aquifers. It is shown that only in the early stages of the recession does the initial state exert a limited influence on the recession. An estimate is made of the upper limit of the time for which the recession becomes effectively independent of the initial state of the aquifer, valid for physically realistic initial states. For useful aquifers initial time cannot be expected to exceed one month. Empirical recessions often are found to be consistent and of an exponential form. (Knapp-USGS)

SIMILITUDE FOR FLOW OF TWO FLUIDS IN POROUS MEDIA,
Shell Oil Co., Denver, Colo. Rocky Mountain Div.; and Colorado State Univ., Fort Collins. Dept. of Agricultural and Irrigation Engineering.
D. B. McWhorter, and A. T. Corey.
French summary included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State Univ, Fort Collins, Vol 1, Paper 18, p 136-140, 1967. 5 p, 2 fig, 11 ref.

Descriptors: *Simulation analysis, *Model studies, *Synthetic hydrology, *Porous media, *Unsaturated flow, Immiscibility, Flow, Porosity, Permeability, Aquifers, Hydraulic models.
Identifiers: Similitude analysis, Multiphase flow.

Criteria of similitude are derived for systems in which two immiscible fluids move simultaneously through a porous medium as, for example, when air replaces water or water replaces air in aquifers. The similitude requirements are established by writing the combined equation of flow, and scaling this with system parameters. The system parameters are selected so that the equation of flow in terms of scaled variables provides a maximum generality and indicates criteria which are the least restrictive and which can be satisfied with laboratory models. The unique feature of this statement of the criteria of similitude (compared to those previously published) is that similitude of the media is determined by the equivalence of a single dimensionless parameter associated with pore-size distribution. The validity of the theory is demonstrated by experiments in which the behavior of similar models are compared. (Knapp-USGS)
W70-03297

GROUNDWATER RESOURCES OF ASH SHATI' AREA, KINGDOM OF LIBYA,
Geological Survey, Washington, D.C.
G. C. Tibbitts, Jr.

Geol Surv Open-file Report, July 1966. 184 p, 30 fig, 12 tab, 28 ref.

Descriptors: *Water resources, *Groundwater, *Arid lands, Artesian wells, Irrigation water, Water supply, Water wells, Water yield, Water quality, Climates, Precipitation (Atmospheric), Hydrogeology.
Identifiers: *Libya, Ash Shati, Oases, Sahara.

Flowing wells, springs, and dug wells that yield water of fair to good chemical quality supply a string of oases in Ash Shati' Libya area. The depression locally receives very infrequent runoff from ephemeral streams rising in the north, but never from the adjacent sand sea to the south. Precipitation averages about 5 mm annually, but in many years no rain falls. Sandstone of Devonian age is the important aquifer of the area, containing water of fair to good chemical quality which is confined under sufficient pressure to flow naturally at many places along Wadi ash Shati'. Contemporary recharge of groundwater in Ash Shati' area is scant and infrequent. Probably much of the water in the aquifer system dates from the Pleistocene. Discharge of water through wells and springs has increased, because of recent drilling, to about 83,000 cu m/day. Pressure head declined about 3 m from 1950 to 1962. About 43% of the discharge is wasted. The excess water causes waterlogging. Evaporation of the water deposits salts in soil in such quantity as to alter soil structure and stunt or preclude growth of crops. (Knapp-USGS)

WATER LEVELS IN ARTESIAN AND NONARTESIAN AQUIFERS OF FLORIDA, 1965-66,
Geological Survey, Tallahassee, Fla.
Henry G. Healy.
Florida State Department of Natural Resources, Bureau of Geology, Information Circular No 61, 1970. 71 p, 47 fig, 1 tab, 1 append.

Descriptors: *Water levels, *Water wells, *Aquifers, *Water level fluctuations, *Florida, Data collections, Hydrologic data, Hydrographs, Surveys, Investigations, Artesian wells.
Identifiers: Florida aquifers.

Water level data from the principal aquifers of Florida, 1965-66 are summarized in tables, hydrographs, and maps. Although groundwater supplies have been adequate in most areas, water levels have declined appreciably in some. Because demand for groundwater continues to increase, shortages will occur and may become critical in some areas. In coastal areas, declining water levels may allow salt water to encroach and shortages could result from deterioration in quality as well as from the reduction of quantity of water available. The water-level data represent measurements taken from automatic water-stage recorder charts, pressure gages, and made by tape. Highest and lowest water levels of record prior to 1965 are given. (Knapp-USGS)
W70-03443

RECONNAISSANCE APPRAISAL OF THE WATER RESOURCES NEAR ESCALANTE, GARFIELD COUNTY, UTAH,
Utah Univ., Salt Lake City. Dept. of Geological and Geophysical Sciences.
Harry D. Goode.
Report available for sale from Utah Geological and Mineralogical Survey, Univ of Utah, Salt Lake City - Price $2.00. Water Resources Bulletin 11, Utah Geological and Mineralogical Survey, Oct 1969. 38 p, 5 fig, 12 plate, 8 tab, 22 ref.

Descriptors: *Water resources, *Groundwater, *Utah, Water wells, Aquifers, Sandstones, Water yield, Water quality, Arid lands, Irrigation water, Water resources development.
Identifiers: Escalante (Utah), Garfield County (Utah).

Surface waters, except for outflow of perhaps 4,000 to 5,000 acre-ft a year down Escalante Canyon and Alvey Wash, Utah are essentially fully appropriated. Dams in Escalante Canyon or Pine Creek or drains in the valley fill in Escalante Canyon and Alvey Wash could capture most of the outflow. Because the water so captured would not satisfy the amounts desired for irrigation, the Entrada (base about 600 ft deep) and/or Navajo Sandstones (top about 1000 ft deep) are suggested for groundwater development. Both formations are porous enough to be good aquifers and both are in favorable geologic positions for producing water. If the Navajo is saturated throughout its thickness of 1500 ft, tremendous quantities of water, estimated at 50,000 to 60,000 acre-ft per sq mi, are in storage and are probably under artesian pressure from the recharge area of the Navajo along the axis of the Escalante anticline. Development of either or both of these probable aquifers could yield the desired 15,000 acre-ft of water from perhaps twenty 20-inch wells. Chemical analyses of spring and surface waters suggest that good water is available from both springs and surface waters. (Knapp-USGS)
W70-03454

RECORDS OF WATER-LEVEL MEASUREMENTS IN OBSERVATION WELLS IN HARRIS COUNTY, TEXAS,
Geological Survey, Austin, Tex.
R. K. Gabrysch, W. L. Naftel, and Gene McAdoo.
Texas Water Development Board Report 103, Dec 1969. 252 p, 1 fig, 1 tab, 4 ref.

Descriptors: *Water levels, *Groundwater, *Observation wells, *Data collections, *Texas, Hydrologic data, Water level fluctuations, Aquifers.
Identifiers: *Harris County (Tex).

A compilation of water-level measurements for Harris County, Texas wells for 1929-1969 is presented. Water-level measurements in most observation wells are made annually, but some measurements are made monthly, quarterly, or semiannually. A continuous record is obtained at a few locations where water-stage recorders are installed. If numerous measurements in a well were made during a short period of time or if water-level data were obtained from a water-stage recorder, representative water levels were selected for publication. (Knapp-USGS)
W70-03459

OCCURRENCE AND QUALITY OF GROUNDWATER IN SHACKELFORD COUNTY, TEXAS,
Texas Water Development Board, Austin.
Richard D. Preston.
Texas Water Development Board Report 100, Oct 1969. 58 p, 14 fig, 8 tab, 61 ref.

Descriptors: *Water resources, *Groundwater, *Water quality, *Texas, Water pollution sources, Brines, Oil fields, Aquifers, Water wells, Water yield, Data collections, Hydrologic data.
Identifiers: Shackelford County (Tex).

Shackelford County is in the drainage basin of the Brazos River in north-central Texas. Permian rocks of the Wichita and Clear Fork Groups, dipping gently to the northwest, are found at the surface within the county. Alluvial deposits of Quaternary age are found along the major streams in the county. Small amounts of groundwater, used mostly for household needs and watering livestock, are produced from formations of Permian age and from Quaternary alluvial deposits. Methods of disposal of oil-field brines are the probable cause of some of the poorer water quality in Shackelford County. Disposal of brine is also responsible for extensive soil damage and vegetative kill in some areas of the county (Knapp-USGS)

Available from US Geological Survey, Wash, DC, 20240 -- Price $0.50. Geological Survey Hydrologic Investigations Atlas HA-334, 1 sheet, 1969. Text, 14 fig, 1 tab, 4 ref.

Descriptors: *Water resources, *Groundwater, *Minnesota, Aquifers, Water yield, Water quality, Water wells, Water supply, Hydrogeology, Hydrologic data, Water table, Water sources.
Identifiers: St. James (Minn).

A 1-sheet hydrological atlas shows the quality and iuantity of groundwater resources in the area of St. James, Minnesota on maps, charts, cross sections and text. The area is covered by a thick layer of glacial drift which is underlain by Cretaceous, Cambrian, and Precambrian rocks. St. James presently obtains its water supply from two aquifers. One is a Cretaceous sandstone 160 ft below the surface, in which two wells are completed. This aquifer yields abundant water but it is of poor quality and is expensive to treat. The second source, tapped by three municipal wells, is a surficial sand and gravel deposit less than 40 ft thick at the well field. This aquifer produces water of better quality, but its extent and capacity are not known. There are other wells in the area completed at depths ranging from 15 to 500 ft. The surficial sand and gravel aquifer is easily drilled and contains water of good quality. Pumping tests on wells 3780 and 5756 indicate coefficients of transmissibility (T) of 3,000 and 10,000 gpd/ft respectively. The storage coefficient (S) is estimated to be in the range of 0.1 to 0.2. An abundant supply of moderately to highly mineralized water is available from the Cretaceous sandstone aquifer at depths generally less than 200 feet. (Knapp-USGS)

MEASUREMENT OF EARTH DISPLACEMENTS INDUCED BY FLUID FLOW,
Stanford Univ., Calif.
Stanley N. Davis, Frank L. Peterson, and Allan D. Halderman.
Report available from Clearinghouse as PB-182 483, $3.00 in paper copy, $0.65 in microfiche. Final Report of Stanford University to National Science Foundation on Project: Micromovements of the Land Surface Produced by Subsurface Flow of Fluids, 1969. 32 p, 4 fig, 14 ref. NSF Project GP-985.

Descriptors: *Groundwater movement, *Strain, *Strain measurement, *Extensometers, Subsidence, Withdrawal, Instrumentation, Darcys law, Discharge (Water), Water level fluctuations, Aquifers, Elasticity (Mechanical).
Identifiers: Earth strain-groundwater relations, Aquifer strain.

Fluid flow to wells produces strain that has been measured as horizontal, vertical, and rotational displacements of reference points fixed on the ground surface. Most linear displacements measured were between 1 and 100 microns and angular displacements were a few microradians. Of the various devices used, a horizontal extensometer proved to

be the most accurate and versatile. Deflections of the land surface resembled quite closely the theoretical vertical deflections caused by a point load on a plate of infinite extent resting on an elastic foundation. Short-term reactions of aquifers are largely elastic except in geologically young materials. Significant horizontal strain was measured in all materials tested. This suggests that accepted equations for fluid discharge from wells should be modified for special conditions near the wells.

HYDROLOGIC CAPACITIES OF SOILS IN WATERSHED ENGINEERING,
Agricultural Research Service, Beltsville, Md. Hydrograph Lab.
H. N. Holtan, C. B. England, and W. H. Allen, Jr.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 29, p 218-226, 1967. 9 p, 5 fig, 3 tab, 10 ref.

Descriptors: *Infiltration, *Surface-groundwater relationships, *Model studies, *Mathematical models, Vegetation effects, Soil water movement, Percolation, Overland flow, Runoff, ·Hydrologic budget, Water storage, Evapotranspiration.
Identifiers: Intermittent rainfall-infiltration model.

A mathematical model is proposed for computing infiltration during intermittent rainfall based upon readily available information on soils and vegetation. The model is adapted to long-term soil moisture accounting and to the computations of areal and temporal distributions of rainfall excess during a storm in sequences compatible with the hydraulics of overland flow. (Knapp-USGS)

THE RECOVERY OF THE INFILTRATION CAPACITY AFTER DRAINAGE,
Cornell Univ. Ithaca, N.Y.
Hassan A. Ibrahim, and Wilfried Brutsaert.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 30, p 227-234, 1967. 8 p, 6 fig, 11 ref.

Descriptors: *Unsaturated flow, *Porous media, *Drainage, *Mathematical models, Groundwater movement, Soil water movement, Infiltration, Hydrograph analysis, Runoff forecasting, Equations.
Identifiers: Flow equations.

Some numerical solutions of the differential equation describing flow in partly saturated porous media are presented. A high speed digital computer was used to obtain these solutions for different initial and boundary conditions representing alternating infiltration and drainage cycles. The hysteresis in the moisture-suction relationship was taken into account and its effect was studied. To increase the applicability of the solutions to a wider variety of field conditions, they are given in dimensionless form. The implications of the obtained results in connection with hydrograph analysis are discussed. (Knapp-USGS)

GREAT SALT LAKE, UTAH: CHEMICAL AND PHYSICAL VARIATIONS OF THE BRINE, 1963-1966,
Geological Survey, Salt Lake City, Utah.
D. C. Hahl, and A. H. Handy.
Report available for sale from Utah Geological and Mineralogical Survey, Salt Lake City, Utah for $2.00. Utah Geological and Mineralogical Survey Water Resources Bulletin 12, 1969. 33 p, 16 fig, 7 tab, 26 ref, append.

Descriptors: *Water chemistry, *Brines, *Great Salt Lake, *Utah, Saline Lakes, Water quality.
Identifiers: Brine properties.

Studies to define the variations in chemical and physical characteristics of Great Salt Lake brine began in 1963. Four types of brine coexist in the lake. Completion of a railroad causeway by the Southern Pacific Co. in 1957 divided the lake into 2 parts and altered the movement of brine. The northwestern part of the lake was essentially cut off from direct fresh-water inflow by the causeway, and as a result it was saturated and well mixed from 1963 to 1966. The southern two-thirds of the lake receives over 90% of the surface inflow and since 1957 has rarely reached saturation. The southern part of the lake is not well mixed, and 3 types of brine have been identified. These brines are located (1) in a zone from the surface to a depth of about 16 ft, (2) in the zone below 16 ft south of the causeway, and (3) in the zone below 16 ft in the south end of the lake. Brine in the shallow southern zone is usually the most dilute of any brine in the lake. The concentrations of dissolved solids of the deep brines vary seasonally. Brine in the deep zone near the south side of the causeway is maintained by a density current that flows from the northern part of the lake through the causeway. Brine in the deep zone at the south end of the lake has a high concentration of sodium and low concentration of sulfate. Brine north of the causeway is reddish-brown and visibility in it is about 2 ft, whereas brine south of the causeway is green and features 15 ft deep can often be clearly seen. (Knapp-USGS)
W70-03279

FACTORS INFLUENCING PHOTOSYNTHESIS AND EXCRETION OF DISSOLVED ORGANIC MATTER BY AQUATIC MACROPHYTES IN HARD-WATER LAKES,
Michigan State Univ., Hickory Corners. W. K. Kellogg Biological Station.
Robert G. Wetzel.
Verhandlungen der Internationalen Vereinigung fur Theoretische und Angewandte Limnologie, Vol 17, p 72-85, Nov 1969. 8 fig, 10 tab, 22 ref.

Descriptors: *Photosynthesis, *Organic matter, *Lakes, *Aquatic plants, *Hardness (Water), Marl, Productivity, Great Lakes, Inorganic compounds, Tracers, Biomass, Calcium, Temperature, Light intensity, Magnesium, Sodium, Potassium, Ecology, Diatoms, Phosphates, Hydrogen ion concentration, Carbon radioisotopes, Metabolism, Oxygen, Hypolimnion, Algae, Bacteria.
Identifiers: *Macrophytes, *Excretion, Dissolved organic compounds, Najas flexilis.

Experimental results with Najas and concomitant investigations on phytoplanktonic organic-inorganic nutrient relationships and direct organic-inorganic chemical interactions show some major cyclic factors regulating photosynthesis in calcareous lakes. Marl lakes exhibit low primary production rates and relatively high hypolimnetic oxygen concentrations which usually remain, although reduced, through or to terminal summer stratification, compounded by years of partial, usually vernal, meromixis. Sedimentary nutrient release is variable and upon recirculation into the alkaline trophogenic zone, largely lost as relatively insoluble carbonates hydroxides, and phosphates, some loss is permanent in dense, calcareous sediments. High levels of calcium, bicarbonate-ion and carbonate-ion combined with high magnesium, low levels of sodium and potassium, and high pH, form a buffered trophogenic littoral zone, relatively untenable for assimilation of certain nutrients. Calcium carbonate in colloidal and particulate form adsorbs certain dissolved organic compounds and this complex serves as a 'sump' reducing function of dissolved organics in direct metabolic utilization and complexing of physiologically unavailable metallic nutrients. Availability of carbon and differential bicarbonate utilization appear major limitations to photosynthetic production. These factors, among others, and their interactions function in a dynamic cyclic causal system to self-perpetuate suppressed potential productivity in marl lakes. (Jones-Wisconsin)

A STUDY OF THE OPEN WATER DISTRIBUTION AND ABUNDANCE OF NET PLANKTON AS AN INDEX OF EUTROPHICATION IN LAKE SUPERIOR,
Minnesota Univ., Minneapolis. School of Public Health.
T. A. Olson.
Technical Completion Report, June 1969. 2 p. OWRR Project No A-011-MINN.

Descriptors: *Lakes, *Great Lakes, *Lake Superior, *Eutrophication, *Zooplankton, *Primary productivity, Lake Huron, Lake Michigan, Lake Erie, Water pollution effects, Bioindicators, Carbon radioisotopes, Phytoplankton, Water pollution sources, Environmental effects, Secondary productivity, Water quality, Oligotrophy, Analytical techniques.
Identifiers: *Net plankton, Hardy Continuous Plankton Recorder, Radiocarbon uptake technique, Plankton abundance, Plankton distribution, Seasonal variations, Daily variations, Water masses, Water pollution assessment.

Based upon criteria of net plankton abundance, determined with the Hardy Continuous Plankton Recorder (CPR), and primary plankton productivity (PPP), determined from measurements of carbon-14 uptake, the status of four Great Lakes sampled, in increasing order of eutrophication, is: Superior, Huron, Michigan, Erie. Lake Erie is more than fourfold productive than any other lake sampled. Eutrophication increases progressively from north to south. Mean seasonal productivity generally increased with ascending temperature of surface waters. Sharply delineated regions of high zooplanktonic density was observed, as expected. Species composition and abundance of zooplankton differ among water masses within lakes, showing seasonal and daily variations. Zooplankters are more abundant locally in chemically polluted areas within lakes. Lowest PPP was observed in central Lake Superior. Lower lakes are most productive, and especially marked increases in PPP occur in regions where massed population and industry have enriched the lakes. Radiocarbon uptake and CPR are effective tools for study of trophic status of waters of Great Lakes Basin, and CPR can provide assessment of pollution and eutrophication on a scale hitherto unavailable for the Great Lakes. (Eichhorn-Wisconsin)

COMPONENTS OF THE BOTTOM FAUNA OF THE ST LAWRENCE, GREAT LAKES,
Toronto Univ (Ontario). Dept. of Zoology; and Fisheries Research Board of Canada, Winnipeg (Manitoba).
R. O. Brinkhurst, A. L. Hamilton, and H. B. Herrington.
Great Lakes Institute, Univ of Toronto, No PR 33, Mar 1968. 50 p, 7 tab, 23 ref, appendix with 11 fig.

Descriptors: *Benthic fauna, *Great Lakes, *St Lawrence River, Oligochaetes, Sampling, Seasonal, Depth, Lake Erie, Lake Ontario, Tubificids, Distribution, Water pollution, Eutrophication, Oligotrophy, Littoral, Limnology, Bathymetry, Temperature, Ecology, Trophic, Lake Huron, Oxygen.
Identifiers: Sphaeriidae, Chironomidae, Georgian Bay (Ontario), Mesotrophic, Lake Nipigon (Ontario), Lake Athabaska (Ontario), Great Slave

Lake (Ontario), Cree Lake (Ontario), Patricia District Lakes, Straits of Mackinac, Species composition, Detroit River, Maumee River, Taxonomy, Core analyses, Chemical conditions, Taxonomic keys.

Bottom fauna were sampled during synoptic cruises through Georgian Bay, Lake Ontario, and Lake Erie and distributions of their major components determined. Oligochaeta, Sphaeriidae, and Chironomidae were separated. Identity of species and their distribution is discussed. Reference is made to other Great Lakes studies on benthos. Samples representing all seasons were included where possible. Results are presented in taxonomic groups and distribution maps. Maps of depth profiles, indicating degree of oxygen depletion in Lake Erie in summer, and bathymetrical maps are included. 31 species of Tubificidae from the Great Lakes and some in Canadian lakes are recorded. In grossly polluted situations, the number of Oligochaetes is very high. Species of the Sphaeriidae identified in the Great Lakes Institute collection are listed. The taxa of Chironomidae, reasonably complete in assessment of the profundal and sublittoral fauna, from these three lakes are listed. To facilitate comparison between these lakes a measure of the 'trophic conditions' of each area was calculated according to ability to withstand eutrophic conditions, providing numerical values which aid in the comparisons of various bodies of water. Key to Tubificidae is given. (Jones-Wisconsin)

CALCIUM IN SOLUTION IN THE LAKE WATERS OF JAPAN,
Tokyo Univ. (Japan). Geographical Inst.
Shinkichi Yoshimura.
Japanese Journal of Geology and Geography, Vol 10, No 1-2, p 33-60, 1932. 2 fig, 7 tab, 52 ref.

Descriptors: *Lakes, *Japan, *Calcium, *Carbonates, Carbon dioxide, pH, Stratification.
Identifiers: *Calcium stratification, Holopedium gebberum, Soft-water lakes, Hard-water lakes, Japanese lakes.

The determination of calcium, carbonates, carbon dioxide, and pH of several Japanese lakes disclosed their very low calcium content. The maximum observed concentration of calcium was 25 parts per million; in most lakes the content is between 5 and 10 parts/million. No deposits of marl or calcium carbonate incrustations have yet been observed in Japanese inland lakes. In comparison with inhabitants of hard waters, the shells of molusca are very thin. Slight stratification of calcium during the stagnation period is not due to precipitation as calcium carbonate, but some other, thus far undisclosed, causes. The one inhabitant well tolerating the low calcium content is Holopedium gebberum. (Wilde-Wisconsin)

EFFECTS OF FERTILIZER ON FOOD CHAIN ORGANISMS AND FISH PRODUCTION IN NORRIS RESERVOIR, TENNESSEE,
Tennessee Valley Authority, Norris. Fish and Wildlife Branch.
C. E. Wood, and T. L. Sheddan.
Tennessee Valley Authority, Fish and Wildlife Branch publication, 1968. 19 p, 5 fig, 11 tab, 8 ref.

Descriptors: *Fertilizers, *Fish food organisms, Aquatic insects, Nitrogen, Phosphorus, Benthic fauna, Forage fish, Tennessee, Zooplankton, Food chains.
Identifiers: *Fish production, Game fish, Norris Reservoir (Tennessee), Clinch River (Tennessee).

Six coves of Norris Reservoir were treated with fertilizer (monoammonium phosphate and ammonium sulfate) in order to (1) ascertain effects of fertilizer on production of game fish and fish food organisms and (2) determine the practibility of fertilization for improvement of game fish production in specific areas. Coves were fertilized at rates of 100 and 50 micrograms/liter nitrogen and 50 and 25 micrograms/liter phosphorus; 2 coves served as controls. Three zooplankton blooms were noted following fertilization, one coinciding with increasing temperature and one coinciding with increased rainfall and surface runoff. Rotifers were most numerous in all coves, copepods and cladocerans were of secondary importance among the zooplankton. Tendiped larvae dominated benthic fauna; tubificids and midge larvae (Ceratopogonidae) contributed important numbers. Benthic fauna were significantly more abundant in coves exposed to lower fertilizer levels. Forage fish dominated samples; no numerical increase of game fish was noted. Amount of fertilizer lost through sinking and flushing was not determined. Graphical and tabular data include hydrography, chemical analyses, and biological analyses of samples from all coves. (Voigtlander-Wisconsin)

THE DISTRIBUTION OF AMMONIA, NITRATES, NITRITES, AND PHOSPHATES IN LAKE CONSTANCE (OBERSEE) IN APRIL 1964 (In German),
Gustav Wagner.
English summary. Archiv fur Hydrobiologie, Vol 61, No 3, p 395-401, June 1965. 1 fig, 3 tab, 10 ref.

Descriptors: *Nitrogen, *Nitrites, *Nitrate, *Phosphorus, Stratification, Thermal stratification, Ammonia, Depth, Water quality, Nitrogen.
Identifiers: Lake Constance, Obersee (Bodensee).

Analyses of water in the early April 1964 indicated incomplete thermal circulation during the preceeding winter. The effect of water of different quality produced irregularities in stratification. The content of ingredients (phosphate, ammonium, nitrite, and nitrate) in the beginning of spring stagnation showed that during the past five years the annual increase of nitrate nitrogen was at a rate of 100 to 150 milligrams/cubic meter, and that of phosphorus at a rate of 2 milligrams/cubic meter. (Wilde-Wisconsin)
W70-03318

STUDIES ON THE SEDIMENTATION IN LAKE BIWA FROM THE VIEWPOINT OF LAKE METABOLISM,
Kyoto Univ. (Japan). Otsu Hydrobiological Station.
Yoshimasa Toyoda, Shoji Horie, and Yatsuka Saijo.
German summary. Mitteilungen Internationale Vereinigung fur Theoretische und Angewandte Limnologie, p 243-255, Mar 1968. 8 fig, 2 tab, 10 ref.

Descriptors: *Lakes, *Metabolism, *Sedimentation, *Seasonal, Stratification, Nitrogen, Phosphorus, Seston, Bottom sediments, Inflow, Degradation (Decomposition).
Identifiers: *Lake Biwa, Euphotic layer, Lake metabolism, Seasonal effects, Chlorophyll a, Sediment age.

The annual rate of deposition of suspended matter near the bottom of Biwa, the largest lake in Japan (674 square kilometers), was estimated as 208 grams/square meter on dry weight basis. The maximum daily deposition of 3 to 6 grams/square meter was in April and May; it decreased in winter to 0.1 gram/square meter. The process was in fair agreement with water outflow, but no correlation was discovered between deposition and the amount of seston. A considerable fraction of organic nitrogen reaches the deposit, whereas most of phosphorus is converted into silicate form in the trophogenic layer. Annual contribution of organic nitrogen to the deposit was only 1/8 to 1/20 of its supply provided by primary production and inflow of seston. Age of bottom sediment was determined on the basis of annual deposition and total content of silicates. The yearly decomposition of nitrogen compounds in the bottom sediment was estimated as 680 milligrams/square meter, that of phosphorus compounds, as 130 milligrams/square meter. (Wilde-Wisconsin)
W70-03319

LIMNOLOGICAL STUDIES OF LAKE NORRVIKEN, A EUTROPHICATED SWEDISH LAKE. I. WATER CHEMISTRY AND NUTRIENT BUDGET,
Uppsala Univ. (Sweden). Inst. of Limnology.
Ingemar Ahlgren.
Schweizerische Zeitschrift fur Hydrologie, Vol 27, No 1, p 53-90, 1967. 22 fig, 7 tab, 46 ref.

Descriptors: *Eutrophication, Inflow, Sampling, Water analysis, Temperature, Oxygen, Hydrogen sulfide, Iron, Sedimentation, Water pollution effects, Water pollution, Water pollution sources, Nitrogen, Phosphorus, Nutrients.
Identifiers: *Lake Norrviken (Sweden), Ruttner water sampler, Oxygen concentration, Madison (Wis) lakes, Transparency, Nutrient budget.

Discharge of yeast factory refuse and sewage from communities involving 1,300 people have imparted to 266 hectare Lake Norrviken in central Sweden, an extreme degree of eutrophication. Nitrogen and phosphorus are now accumulating in amounts of 44,000 and 5,280 kilograms/year, respectively. The present nitrogen concentration is as high as 3.4 parts per million (ppm) and that of phosphorus 0.26 ppm, inducing luxuriant development of macrovegetation and planktonic algae. The two major consequences include nuisance bloom of blue-green algae and a critical deficiency of oxygen; under ice cover the entire mass of water becomes oxygen-free. Water waste from the yeast factory delivers more than 80% of nitrogen and 70% of phosphorus. Phosphorus accumulates in the sediment; a large fraction of nitrogen compounds presumably undergoes reduction to free nitrogen. (Wilde-Wisconsin)
W70-03322

FERTILIZATION OF LAKES IN ALGONQUIN PARK, ONTARIO,
Toronto Univ. (Ontario); and Department of Lands and Forests (Ontario).
R. R. Langford.
Transactions of the American Fisheries Society, Vol 78, p 133-144, 1948. 5 fig, 4 tab, 7 ref.

Descriptors: *Fertilization, *Lakes, Productivity, Phytoplankton, Nutrients, Zooplankton, Diatoms, Protozoa, Rotifers, Copepods, Oceans, Fresh water, Biota, Environment, Benthos, Forage fish, Biomass, Nitrogen, Phosphorus, Potassium, Acreage, Depth, Epilimnion, Nannoplankton.
Identifiers: *Algonquin Park (Ontario), Flagellates, Chemical fertilizer, Game fish, Brewer Lake (Ont), Cache Lake (Ont), Dissolved chemicals, Fragillaria Tabellaria, Melosira, Dinobryon, Asterionella, Synura, Cyclops, Keratella, Notholca, Polyarthra, Diaptomus, Kearney Lake (Ont), Costello Lake (Ont), McCauley Lake (Ont).

Since many lakes in the Canadian Shield area of Ontario are poor in dissolved minerals and low in fish productivity, an investigation was made of the possibilities of increasing yield by fertilization. For a complete analysis of fertilization results, changes in the complex biota and physical environment were followed. Fertilization was begun in Algonquin Park in 1946 as part of the investigation of factors controlling lake productivity. Four lakes had been fertilized and one other used as a control. Detailed analyses were conducted to assess changes in dissolved chemicals, the plankton, bottom organisms, forage fish, and game fish, in order to determine the fate of the augmented inorganic nutrients in the biomass. The response of phytoplankton and zooplankton populations to increased nutrients is indicated. Marked increase in net phytoplankton occurred in each lake from three weeks to a month after first application. Diatoms and flagellate protozoans showed the greatest increment. Rise in zooplankton organisms

was relatively lesser than of phytoplankton although the rotifer populations did increase in all lakes. (Jones-Wisconsin)
W70-03323

THE INFLUENCE OF SOME ENVIRONMENTAL FACTORS ON STANDING CROP AND HARVEST OF FISHES IN US RESERVOIRS,
Bureau of Sport Fisheries and Wildlife, Fayetteville, Ark.
Robert M. Jenkins.
Reservoir Fishery Resources Symposium, Athens, Georgia, Apr 5-7, 1967, p 298-321, Nov 1968. 4 fig, 9 tab, 18 ref.

Descriptors: *Environmental effects, *Reservoir fisheries, Commercial fish, Dissolved solids, Multiple-purpose reservoirs, Regression analysis, Sport fish, Fish, Standing crop, Reservoirs.
Identifiers: Clupeids, Multiple regression analysis, Storage ratios.

Multiple regression analyses were performed to ascertain the effects of nine environmental factors on sport and commercial fish standing crops and harvests in 127 reservoirs in 33 states. Factors exerting greatest positive influence included total dissolved solids on standing crop and sport fish yield; age of reservoir on clupeid standing crop and commercial harvest. Strong negative influences include age of reservoir on sport harvest; area on sport harvest; mean depth and shoreline development on commercial harvest. Multiple regression models of greatest predictive utility include standing crop on dissolved solids divided by mean depth; standing crop on dissolved solids, shore development and storage ratio; commercial harvest on growing season, mean depth, storage ratio, age, and water level fluctuation. Tabular data include results of single-factor and multiple regressions and a complete tabulation of all data utilized on the reservoirs studied. (Voigtlander-Wisconsin)

SOME EFFECTS OF LAKE RENEWAL ON PHYTOPLANKTON PRODUCTIVITY AND SPECIES COMPOSITION,
British Columbia Univ., Vancouver. Inst. of Fisheries.
Mike Dickman.
Limnology and Oceanography, Vol 14, No 5, p 660-666, Sept 1969. 6 fig, 11 ref.

Descriptors: *Lakes, *Phytoplankton, *Primary productivity, Light intensity, Biomass, Water pollution effects, Eutrophication, Oligotrophy, Nannoplankton, Limiting factors, Rainfall, Carbon radioisotopes, Environmental factors, Chlorophyta, Temperature, Diatoms, Periphyton, Grazing, Correlation analysis, Nutrients.
Identifiers: *Lake renewal, *Species composition, Marion Lake (B C), British Columbia, Canada, Flushing rates, Ratio (Production/Biomass), Instantaneous productivity rates, Radiocarbon uptake technique, Denmark, North Alouette River (B C), Pyrheliometry, Algal growth, Oocystis, Elakatothrix, Desmids, Flagellates, Resource factors, Cropping factors, Nutrient limited growth.

A continuum may exist between waters defined as streams or lakes. In small lakes with high runoff, factors limiting phytoplankton production, termed 'resource factors' may be secondarily important if considerable planktonic biomass is removed by flushing. With light intensities corrected to a standard level, primary production in Marion Lake, British Columbia, varies inversely with rates at which water enters. Increased flushing reduces phytoplanktonic biomass, thereby lowering lake's total primary productivity, with seasonal variations in rainfall greatly influencing annual productivity of phytoplankton. Lake water artificially enclosed by plywood containers (3.05 meters square) within small areas of the lake, produced blooms principally composed of larger green algae, while phytoplanktonic biomass in surrounding lake water remained low. In Marion Lake, nannoplankton apparently have a selective advantage as compared with larger, more slowly reproducing species. The ratio, production/biomass (P/B), may be useful in establishing whether resource or cropping factors have greater influence on instantaneous rates of productivity in lakes. Although a lake may apparently be highly oligotrophic, tests of possible limiting nutrients or other resources may have little value if both species composition and P/B clearly indicate that cropping factors limit primary productivity. (Eichhorn-Wisconsin)
W70-03328

LIMNOLOGICAL OBSERVATIONS ON WESTERN LAKE SUPERIOR,
Minnesota Univ., Minneapolis. School of Public Health; and Minnesota Univ., Duluth. Dept. of Biology.
Theodore A. Olson, and Theron O. Odlaug.
Great Lakes Research Division, The University of Michigan, Publication No 15, p 109-118, 1966. 2 fig, 5 tab, 5 ref.

Descriptors: *Limnology, *Lake Superior, Productivity, Crustaceans, Chlorophyll, Carbon, Depth, Seasonal, Light penetration, Biomass, Water measurement, Carbon radioisotopes, Energy, Trophic level, Water quality, Ecosystems, Zooplankton, Phytoplankton, Tracers, Sampling, Volume, Daphnia, Weight, Standing crop, Grazing, Termocline, Temperature, Primary productivity.
Identifiers: Larsmont-Knife River (Minn), Limnocalanus macrurus, Bosmina coregoni, Daphnia pulex, Daphna longispina, Polyphemus pediculus, Leptodora kindtii, Dinobryon sertularia, Coccochloris elebens, Asterionella formosa, Crucigenia tetrapedia, Cyclotella Kutzingiana, Synedra acus.

This summer period study, concerned with 1964 Lake Superior productivity estimates, is based on total plankton counts, abundance of plankton crustacea, quantity of chlorophyll and carbon fixation values found in water samples from the Larsmont-Knife River area. Counts of centrifuged plankton ranged from 21 to 55 organisms/milliliter. At the 5-meter level, minimum was 21 organisms and maximum 48; at 10 meters, range was 29 to 45. Crustacean counts varied with advancing season and depth. Counts obtained by Clarke-Bumpus (C-B) hauls varied from 39 (July 16) to 9,177 organisms per C-B scale unit (August 13). At 10-meter level, daylight counts ranged from 437 (July 16) to 9,177 (August 13) per C-B unit. At 30 meters, well below the 1% light transmission level, daylight counts were 51 and nightly counts 30 organisms/scale unit. One observation (August 6) showed the number at 30-meter depth can reach the level of one organism/7 liters. Chlorophyll varied from 0.5 milligrams (July 28) to 3.2 (August 4) per cubic meter. Concentration also varied with depth and water mass. Carbon fixation values (C-14 technique) varied from 0.13 to 0.73 milligrams carbon fixed/cubic meter per hour. (Jones-Wisconsin)

CHIRONOMIDA AND THE STUDY OF LAKE TYPES,
Franz Lenz.
Die Naturwissenschaften, Vol 13, p 5-10, 1925. 12 ref.

Descriptors: *Lakes, Limnology, Eutrophication, Oligotrophy, Nutrients, Basins, Dystrophy, Oxygen, Depth, Sedimentation, Plankton, Dissolved solids, Metabolism, Respiration, Nitrogen, Phosphorus, Calcium, Humus, Biological communities, Ecology, Temperature, Ponds, Streams.
Identifiers: *Chironomida, *Lake types, Tanytarsus, Mesotrophy, Polytrophy, Fauna, Lauterbornia coracina, Prodiamesa bathyphila, Monodiamesa bathyphila, Mysis relicta, Norway, Finland, North Germany, Lunzer Untersee, Vierwaldstatter See, Didiamesa miriforceps, Sergentia, Polypedilum, Stictochironomus, Einfelder See (Holstein), Einfeldia insolita Kieffer, Chironomus plumosus, Chironomus bathophilus, Lenzia, Pentapedilum, Sweden.

An outline of the role played by Chironomida in lake characteristics, systematics, and solutions to problems is given. Most eutrophic lakes belong to the Chironomus lake type; all oligotrophic lakes are Tanytarsus lakes. Oxygen content of deep water plays the major role in regulating colonization. All factors contained in the milieu spectrum can exert an influence on members of the biocoenosis whether they directly promote, inhibit, or disturb life functions or indirectly change environment. That Chironomidae do not uniformly colonize the depths of Tanytarsus lakes is affirmed. Their components can be associated with different biocoenoses and can occur in different intensities. Lakes' character can be altered decisively in any direction by change in primary factor complex, or milieu spectrum. Variation in composition of the Chironomida fauna in Tanytarsus lakes may be based on different causes. Definite forms have developed or colonized with adaptation to specific characteristics. Factors which determine the environment influence the elimination of certain forms, then other types, having a greater adaptation range, can assume their place. (Jones-Wisconsin)

ECOLOGY OF CHIRONOMIDAE, CHAOBORIDAE, AND OTHER BENTHOS IN FOURTEEN WISCONSIN LAKES,
Wisconsin Univ., Madison. Dept. of Entomology.
William L. Hilsenhoff, and Richard P. Narf.
Annals of the Entomological Society of America, Vol 61, No 5, p 1173-1181, Sept 1968. 4 fig, 4 tab, 5 ref.

Descriptors: *Ecology, *Benthos, *Wisconsin, *Lakes, Copepods, Hydrogen ion concentration, Organic matter, Mud, Eutrophication, Thermocline, Profundal zone, depth, Sampling, Temperature, Oxygen, Oxidation-reduction potential, Light intensity, Suspended load, Nitrites, Ammonia, Phosphorus, Iron, Crustaceans.
Identifiers: *Chironomidae, *Chaoboridae, Chironomus plumosus, Procladius, Chaoborus punctipennis, Chaoborus albatus, Palpomyia, Ostracoda, Chironomus 'A', Chironomus staegeri, Chironomus 'C', Chironomus attentuatus, Clear water, North America, Taxonomic key, Chironomus tentans, Chironomus 'D', Chironomus atroviridis, Chironomus paganus, Chironomus 'B'.

Benthos ecology in the profundal zones of 14 Wisconsin lakes was studied for three years. Chironomid larva were reared to the imago for identification, and a key to species of Chironomus larvae constructed. Population of 10 species of Chironomus, Procladius, three species of Chaoborus, Palpomyia, Ostracode, and Copepoda were determined from monthly samples and correlated with 14 physical and chemical characteristics, to determine possible relationships. Chironomus plumosus (L), Procladius larvae, and Ostracoda occurred in the same lakes, and this incidence was positively correlated with a high pH of the mud and negatively related with the amount of organic matter in mud. Presence of C attenuatus Walker and Palpomyia larvae was correlated with clear water. Chironomus 'A', C staegeri Lundbeck, and Chironomus 'C' were most common in the same lake. Chaoborus punctipennis (Say) larvae were frequent in lakes forming a summer thermocline, and Copepoda were abundant in the most eutrophic lakes. Details on specie occurrence are given, with notes on rarer insects in the profundal zones. The third most plentiful insect family in the profundal mud was Ceratopogonidae. (Jones-Wisconsin)

A GRAIN SIZE ANALYSIS OF LONGSHORE-BARS AND TROUGHS, LAKE SUPERIOR, ONTARIO,
Lakehead Univ., Port Arthur (Ontario).
John S. Mothersill.
Journal of Sedimentary Petrology, Vol 39, No 4, p 1317-1324, Dec 1969. 8 p, 9 fig, 11 ref.

Descriptors: *Lakes, *Sediments, *Beaches, *Lake Superior, Sampling, Mapping, Mathematical studies, Statistical methods, Waves (Water), Petrology, Laboratory tests, Shores, Geology, Glaciation, Clays.
Identifiers: Lake beach sedimentation.

Grain size analyses of 186 samples from the axes of longshore-bars and troughs along the lake shelf at Batchawana Bay and Pancake Bay, Lake Superior, Ontario, show the longshore-bar sands to be better sorted and finer grained than the adjacent shoreward longshore-trough sands. In addition the longshore-bar sands are unimodal and tend to be positively 'skewed' whereas the longshore-trough sands may be either unimodal or bimodal and show a tendency towards negative skewness. This would suggest that the longshore-troughs were formed by the action of breaking waves that preferentially set the finer grained particles into motion. These finer grained particles were then moved lakeward by the undertow to form the longshore-bar areas. (Gabriel-USGS)

PRELIMINARY STUDIES OF ZOOPLANKTON DISTRIBUTION WITH THE CONTINUOUS PLANKTON RECORDER,
Minnesota Univ., Minneapolis. Water Resources Research Center.
Wayland R. Swain, Theodore A. Olson, and Theron O. Odlaug
Available from the Clearinghouse as PB-189 294, $3.00 in paper copy, $0.65 in microfiche. Water Resources Research Center, Minnesota University, Minneapolis, WRRC Bulletin 7, Nov 1968. 21 p, 14 fig, 11 ref. OWRR Project A-011-MINN.

Descriptors: *Zooplankton, *sampling, *Lakes, *Biogeography, Great Lakes, Lake Superior, Lake Michigan, Minnesota, Illinois, Indiana, Species composition, Data acquisition, Limnology, Copepods, Cladocera, Phytoplankton, Diatoms.
Identifiers: *Hardy Continuous Plankton Recorder, Scottish Marine Biological Ass, Duluth (Minn), Chicago (Ill), Two Harbors (Minn), Gary (Ind), Patchiness, Plankton abundance, S S Cason J Callaway, Diaptomids, Mysis oculata relicta, Limnocalanus macurus, Diaptomus, Senecella, Daphnia pulex, Daphnia longispina, Bosmina corrigoni, Bosmina longirostris, Tabellaria fenestrata, Asterionella formosa.

The Hardy Continuous Plankton Recorder concentrates net plankton on a continuously unrolling belt of silk bolting cloth, which interceps a stream of water diverted through the sampler. Originally devised for use in the North Sea, the device has potential application in large fresh bodies of water. The sampler, towed by a commercial ore carrier, was tested over regular shipping routes in Lakes Superior and Michigan, sampling a transect 1/2-inch square and 300-500 miles long. Procedures are described for enumeration of plankton accumulated on the silk belts. Variations in abundance and species composition were noted between different areas of the lakes, such regional differences contributing to typical 'patchiness' of zooplankton distribution. Ratio of observed Copepoda to Cladocera is about 5:1. Limnocalanus macurus was the predominant copepod, while species of Diaptomus also contribute significantly. Marked daily variations in both abundance and faunal composition existed at depths of 10 meters, with maximum density occurring during hours of darkness. Large localized areas with abundant phytoplankton--largely the diatom Tabellaria fenestrata, but including Asterionella formosa in smaller numbers--were also encountered. (Eichhorn-Wisconsin)

PRESIDENT'S LECTURE: LIMNOLOGY, SOCIAL WELFARE, AND LAKE KINNERET,
Uppsala Univ. (Sweden). Inst. of Limnology.
Wilhelm Rodhe.
Verh Internat Verein Limnol, Vol 17, p 40-48 Nov 1969. 12 ref.

Descriptors: *Limnology, *Social needs, Ecosystems, Sampling, Seiches, Depth, Stratification, Winds, Temperature, Epilimnion, Thermocline, Hypolimnion, Phytoplankton, Chemical analysis, Zooplankton, Light penetration, Primary productivity, Carbon radioisotopes, Computer programs, Reservoirs, Political aspects, Eutrophication, Sewage, Effluents, Bottom sediments, Biochemical oxygen demand, Inorganic compounds, Nutrients, Lake Erie, Lake Ontario, Lake Michigan, Nitrogen, Productivity, Water quality, Industries, United Nations.
Identifiers: *Lake Kinneret (Israel), Beit Netufa (Israel), Winnipeg (Canada), Lake Zurich (Switzerland), Lake Baikal, Lake Washington (Wash), Seattle (Wash), Sweden, Lake Malaren (Sweden), World Health Organization.

In limnology each component is regarded a link in the ecosystem and the entire ecosystem a product of sources and surroundings. Sound water policy must be included in the social planning of every community and industry and the cost of clean waters must be met. The difficulty lies in the failure of politicians to recognize limnological advances and act on them on a global concept. Israel's Lake Kinneret Research Project requires regular sampling of basic data: three 'isothermal samples' at each station are necessary to represent lower epilimnion, steepest thermolcline, and upper hypolimnion, and, with samples close to the surface and bottom, make a weekly load of 35 samples from seven stations for chemical analyses and quantitative determinations of plytoplankton and zooplankton. At one station, a series of samples from 5 or 3 depths will be preserved for information concerning vertical distribution of plankton. Measurements of light penetration and carbon-14 exposures are made to determine primary production. Continuous meteorological and hydrological records are indispensable for interpretation of seiches and other dynamic phenomena. Augmentation of the study of Lake Kinneret and its tributaries with the work at MEKOROT laboratory at Beit Netufa reservoir is intended. (Jones-Wisconsin)

Descriptors: *Temperature, *Reservoirs, Lakes, *Hypolimnion, Epilimnion, *Thermal stratification, Water circulation, Dissolved oxygen, Thermal properties, Alkalinity, Hydrogen low concentration, Water quality.
Identifiers: Czechoslovakian reservoirs, Slapy reservoir (Czechoslavakia).

The Slapy Reservoir on the Vltava River is narrow, long and deep, (mean width 313 m, length 42 km, max. depth 53 m). The ratio of volume to mean inflow indicates a mean renewal time of 38.5 days. A comparison of temperatures of the inflow, outflow and surface of the reservoir shows that the mean renewal time of the surface layers is much less than in lakes of a comparable drainage. During high flows, the release of water from the very deep layers is followed even in summer by horizontal currents, the velocity of which is at a distance of 9.1 km from the dam several decimeters per second. This characteristic of the deeper layers of the reservoir, when compared with lakes, is also manifested by an increase in oxygen in the deep layers during the second half of the summer, without inducing the homoiothermal conditions. ROOTING PATTERNS OF FOREST UNDERSTORY SPECIES AS DETERMINED BY RADIOIODINE ABSORPTION,
Montana Univ., Missoula. School of Forestry; and Montana Univ., Missoula. Dept. of Chemistry.
Thomas J. Nimlos, Wayne P. Van Meter, and Lewis A. Daniels.
ECOLOGY, Vol 49, No 6, p 1146-1151, Autumn 1968. 4 tab, 1 fig, 14 ref.

Descriptors: *Runoff, *Root zones, Root systems, Plant growth.
Identifiers: *Rooting patterns, *Understory plants, Radioiodine, Moisture regimes.

The rooting patterns of understory plants were determined with minimal disturbance of the site by injecting radioiodine into the soil and the beta and gamma activity of the aboveground tissue measured with a Geiger-Mueller detector. Injections were made to 72 inches in a clay, stone-free soils. Modifications of the procedure are required for injections to depths greater than 36 inches in stony soils. The procedure was applied to two sites of different moisture regimes. Many of the species studied rooted to 72 inches though the amount of aboveground tissue was only a few grams. Rooting on dry sites was deeper than at the more mesic site.

AN OPTICAL METHOD OF MEASURING GRAIN ORIENTATION IN SEDIMENTS,
Koninklijke-Shell Exploratie en Produktie Laboratorium, Rijswijk (Netherlands).
A. M. Winkelmolen, W. Van der Knaap, and R. Eijpe.
Sedimentology, Vol 11, No 3-4, p 183-196, Dec 1968. 14 p, 10 fig, 6 ref.

Descriptors: *Analytical techniques, *Particle shape, *Petrofabrics, Sediments, Optical properties, Petrography, Sedimentary rocks, Instrumentation, Photography, Sedimentary petrology.
Identifiers: Particle orientation, Optical techniques.

A new method for the measurement of grain orientation in clastic sediments is based on the principle that when an inclined beam of light passes through an elliptical hole in a plate, the amount of light passing through fluctuates with the orientation of the long axis of the ellipse. Such fluctuations are larger the greater the eccentricity of the ellipse, the amount of light passed being maximal when the long axis coincides with the plane of incidence of the light. If the plate contains many holes, which can be approximated by ellipses, their main orientation direction can be inferred from the maximum intensity of passed light. Results of a similar kind can be obtained by using a black and white picture of grain packing, obtained either from thin-sections or from printed replicas of etched polished sections of impregnated samples. The resulting data represent an integrated orientation pattern instead of a long-axis distribution pattern as given by the grain-by-grain counting technique. The new method has been thoroughly checked against the visual counting method. Excellent agreement was observed. (Knapp-USGS)

WEATHERING AND ROUNDNESS OF QUARTZ SAND GRAINS,
Australian National Univ., Canberra. Dept. of Geology.
Keith A. W. Crook.
Sedimentology, Vol 11, No 3-4, p 171-182, Dec 1968. 12 p, 1 fig, 3 plate, 21 ref, 1 append.

Descriptors: *Particle shape, *Sands, *Quartz, Solubility, Corrosion, Weathering, Diagenesis, Climates, Soil formation, Soil chemistry, Sediments, Sedimentary petrology.
Identifiers: Quartz grain solution.

Photographs and descriptions of quartz sand grains from soils, paleosols and silcretes show that grain shape can be modified by solution in situ. Dissolution is attributed to solutions rich in organic molecules present in weathering profiles, and commonly results in rounding of protuberances and reentrants on grains. The incidence of this process may vary with climate. It is postulated that solution rounding during weathering plays an important role in shaping quartz sand grains in general, its significance varying with climate. This postulate, which remains unconfirmed, has considerable implications for the interpretation of textural maturity of sandy sediments. If true, super-mature sands may be as much a climatic indicator as an indicator of tectonic quiesence. (Knapp-USGS)

DIAGENETIC RE-CRYSTALLIZATION AND ORIENTATION OF TWO CARBONATE SPECIES,
Durham Univ. (England). Dept. of Geology.
P. B. Attewell, D. M. Hirst, and R. K. Taylor.
Sedimentaology, Vol 11, No 3-4, p 237-247, Dec 1968. 11 p, 6 fig, 2 tab, 17 ref.

Descriptors: *Diagenesis, *Carbonate rocks, *Calcite, *Clay minerals, *Petrofabrics, Stratification, Beds, Stress, Pressure, Water chemistry, Laboratory tests, Petrology, Petrography, Sedimentary petrology.
Identifiers: Particle orientation, Recrystallization.

Results of X-ray textural studies of dolomite and the clay minerals in the Marl Slate and of siderite from the top of the Mansfield Marine Band are interpreted in terms of the possible diagenetic development of the re-crystallized carbonates in these two rocks. From computer processed fabrics of the two trigonal carbonates it is deduced that there is a c-axis preferred orientation concordant with the normal to the stratification. An early diagenesis in this oriented mode must be a function of both a threshold stress difference in a non-hydrostatic stress field (in effect a necessary minimum depth of burial) and also of the presence of connate solutions. The existence of a minor percentage of dolomite oriented with the rhomb faces parallel to the stratification probably reflects an even earlier crystallization within the top few meters of sediment, when the confining pressures and pressure differences were of insignificant amplitude. It is concluded that a higher rate of sedimentation associated with the Coal Measure sequence is responsible for the singular preferred orientation of the siderite. (Knapp-USGS)

X-RAY RADIOGRAPHY FOR EXAMINATION OF BURROWING IN SEDIMENTS BY MARINE INVERTEBRATE ORGANISMS,
Georgia Univ., Sapelo Island. Marine Inst.
James D. Howard.
Sedimentology, Vol 11, No 3-4, p 249-258, Dec 1968. 10 p, 5 fig, 17 ref.

Descriptors: *Sedimentary petrology, *Laboratory tests, *X-ray analysis, *Burrows, Aquatic animals, Sedimentary structures, Sediments, Deposition (Sediments).
Identifiers: Biotrbation.

Examination of the primary sedimentary texture of rocks and sediments by X-radiography can be extended to include the study of bioturbation and burrowing by living organisms. This technique involves making time-lapse X-radiographs while the animals are in the process of disturbing the sediment. Artificially and naturally stratified sediments are contained in plexiglass aquaria connected to a continuously flowing seawater system. The burrowing animals to be studied are introduced into these aquaria and the effect of their activities on the sediments is recorded by X-radiography over a period of hours, days or weeks. (Knapp-USGS)
W70-03286

PARTICLE SHAPE AND INFERENCE OF SIZE FROM SIEVING,
Gulf Research and Development Co., Pittsburgh, Pa.
John C. Ludwick, and Patricia L. Henderson.
Sedimentology, Vol 11, No 3-4, p 197-235, Dec 1968. 39 p, 11 fig, 1 plate, 7 tab, 21 ref.

Descriptors: *Particle size, *Sieve analysis, *Statistical methods, *Calibrations, Histograms, Frequency analysis, Probability, Mathematical models, Laboratory tests, Test procedures, Sedimentology, Sediments, Sands, Sedimentary petrology.
Identifiers: Sieve performance analysis.

Accurate particle-size measurement by sieving requires that consideration is given to particle shape and screen opening size variations. The effect of particle shape has been studied by determining experimentally the probability of passage through each of 5 woven-wire screens of 35 different mm-sized ellipsoids. These range in shape from T/D = 0.2 to 1.0 and from L/D = 1.125 to 2.625, where T is particle thickness, L is particle length, and D is particle intermediate diameter. A mathematical sieving theory stemming from the idea of particle passing probability is developed and tested by computer-simulated sieving of idealized input samples of simple shape composition. When near-spheres are sieved a bar-type histogram results. For some other more realistic shape inputs, broad, overlapping bell-shaped fraction distributions result, considerably different from the nominal openings of the limiting screens. For these distributions, conventional representation in histogram form is incongruous. (Knapp-USGS)
W70-03287

TEXTURAL STUDIES OF GRADING: VOLCANIC ASH FALLS,
Illinois Univ., Urbana; and Indiana Univ., Bloomington.
Adrian E. Scheidegger, and Paul Edwin Potter.
Sedimentology, Vol 11, No 3-4, p 163-170, Dec 1968. 8 p, 2 fig, 8 ref, 1 append.

Descriptors: *Aeolian soils, *Graded, *Beds, *Volcanoes, *Geomorphology, Aggradation, Deposition (Sediments), Sedimentation, Sedimentology, Stratification, Sedimentary structures, Sediment transport, Turbulent flow, Diffusivity, Sedimentary petrology.
Identifiers: *Graded bedding, *Ashfalls (Volcanic).

A theory of the lateral decrease of grain size and bed thickness with increasing distance of downwind transport is developed for ash falls. The theory is based on the sediment load density of a turbulent slug of fluid, a turbulent diffusivity coefficient, and the decay of turbulent velocity fluctuations. All three factors are founded on empirical observation and are generally accepted as having widespread applicability to turbulent sediment-fluid mixtures. The theory yields good qualitative agreement with observational data. (Knapp-USGS)
W70-03288

INTRICATED CROSS-STRATIFICATION DUE TO INTERACTION OF A MEGA RIPPLE WITH ITS LEE-SIDE SYSTEM OF BACKFLOW RIPPLES (UPPER-POINTBAR DEPOSITS, LOWER RHINE),
Utrecht Rijksuniversiteit (Netherlands). Geological Inst.; and State Geological Survey, Haarlem (Netherlands).
J. R. Boersma, E. A. Van de Meene, and R. C. Tjalsma.
Sedimentology, Vol 11, No 3-4, p 147-162, Dec 1968. 16 p, 9 fig, 9 ref.

Descriptors: *Ripple marks, *Dunes, *Sedimentary structures, *Sand waves, Currents (Water), Eddies, Vortices, Turbulent flow, Meanders, Bed load, Alluvial channels, Sediment transport, Channel morphology, Sedimentary petrology.
Identifiers: Megaripples, Rhine River, Cross-stratification, Forest beds.

Of several uncommon types of large-scale cross-stratification encountered in Late Holocene upper-pointbar sandy deposits of the Rhine, one is examined in detail. This type is structurally bipartite as it consists of a relatively coarse-grained, upper interval of large-scale foresets, which indentate with the oppositely dipping small-scale foresets in the underlying finer interval. The interwoven set is regarded as formed by a mega ripple (dune) with, in front of it, a simultaneously active system of small-scale, oppositely moving, ripples propelled by the backflow branch of the mega ripple's lee-side vortex. Comparison of dip, strike, and principal bedding-plane sections brought to light dissimilarity in the crestline orientations of the mega-ripple and backflow-ripple systems. The latter's oblique, or incidentally perpendicular orientation with respect to the mega-ripple front indicates a conspicuous component of lateral water movement, which in the present outcrop was consistent from left to right looking down stream. It is suggested that this lateral water movement is due to the radial (transverse) flow in the bend of a meandering river. From the sense of the radial flow the river's bend configuration can be inferred. (Knapp-USGS)
W70-03289

HEAVY MINERALS AND SIZE ANALYSIS OF THE CITRONELLE FORMATION OF THE GULF COASTAL PLAIN,
Louisiana State Univ., Baton Rouge.
Norman C. Rosen.
Journal of Sedimentary Petrology, Vol 39, No 4, p 1552-1565, Dec 1969. 14 p, 6 fig, 1 tab, 53 ref.

Descriptors: *Sedimentary petrology, *Provenance, *Mineralogy, *Mississippi River, *Gulf Coastal Plain, Geomorphology, Sedimentation, Sediment transport, Erosion, Particle size, Pleistocene epoch.
Identifiers: Heavy mineral analysis, Citronelle Formation.

The heavy minerals of the Citronelle Formation and fluviatile terraces of Louisiana were examined to determine the source of these sediments. An East Gulf Province heavy mineral suite (kyanite, staurolite, zircon, tourmaline), typical of the Cretaceous and Tertiary sediments of the Gulf Coastal Province is present throughout the Citronelle and older Louisiana terrace deposits. A Mississippi River province suite (epidote, dolomite, amphibole-pyroxene, garnet), presumably derived from the glacial deposits of the northern United States, is present in the younger Louisiana terrace deposits. The Citronelle Formation appears to represent an alluvial apron formed by coalescing, braiding streams in response to epeirogenic uplift of the continental interior during Late Pliocene to preglacial Pleistocene time. Encisement of the Mississippi River and other streams into Citronelle sediments resulted in entrenched valleys containing fluviatile terraces which are mineralogically and lithologically similar to the Citronelle but are at lower elevations. Younger terrace deposits bearing a Mississippi River province heavy mineral suite are believed to have formed in response to fluctuating sea level during the Pleistocene. (Knapp-USGS)
W70-03445

SUBAERIAL CEMENTATION AND SUBSEQUENT DOLOMITIZATION OF LACUSTRINE CARBONATE MUDS AND SANDS FROM PALEO-TUZ GOLU ('SALT LAKE'), TURKEY,
Heidelberg Univ., (West Germany). Sediment Research Lab.
German Muller, and Georg Irion.
Sedimentology, Vol 12, No 3/4, Special Issue, p 193-204, June 1969. 12 p, 11 fig, 7 ref.

Descriptors: *Dragenesis, *Carbonate rocks, *Dolomite, *Limestones, *Playas, Lakes, Water chemistry, Calcium, Magnesium, Carbonates, Chemical precipitation, Geochemistry, Sedimentary rocks.
Identifiers: *Turkey, Anatolia, Tuz Golu.

Along the eastern coast of the Gez Golu, a salt lake formerly belonging to the larger 'Paleo-Tuz Golu' in central Anatolia, about 6.5 m of lake sediments of probably Pleistocene age were studied. The sediment series consists of fine-grained unconsolidated dolomite muds representing the basin sedimentation of the old lake. Nine lithified beds (oomicrites, intramicrites, intraoomicrites, intrabiomicrites and dololutites with smaller amounts of allochems) are intercalated. These beds were deposited in very shallow water in the littoral zone of the paleo-lake. The beds were occasionally exposed to the air after deposition. This led to desiccation (with mud cracks, breaking up of intraclasts) and subaerial cementation due to the influx of fresh water. These now lithified carbonate sedimentary rocks were submerged and subsequently covered with mud. During this sub-aquatic phase the rock beds as well as the unconsolidated muds were dolomitized by an extremely high Mg/Ca-ratio (150/1) of the lake water. Dolomitization may have taken place or was initiated during the subaerial phase. (Knapp-USGS)
W70-03446

STRUCTURAL AND TEXTURAL EVIDENCE OF EARLY LITHIFICATION IN FINE-GRAINED CARBONATE ROCKS,
Technische Universitaet, Berlin (West Germany). Inst. of Geology and Paleontology.
H. Zankl.
Sedimentology, Vol 12, No 3/4, Special Issue, p 241-256, June 1969. 16 p, 7 fig, 28 ref.

Descriptors: *Diagenesis, *Carbonate rocks, *Water chemistry, Sedimentation, Chemical reactions, Calcium, Magnesium, Carbonates, Chemical precipitation, Geochemistry, Sedimentary rocks.
Identifiers: Carbonate sediment lithifications, Lime muds.

Absence of compaction, intraformational breccias, resedimentation, internal sediments and synsedimentary hardgrounds indicate early lithification of finegrained carbonate rocks. One of the factors controlling early lithification is the purity of lime mud. Less than 2% of insoluble residue (especially clay minerals) favors cementation and recrystallization before further sediment accumulation causes compaction. Thus, early lithification is terminated in or near the environment of sedimentation. Electrochemical reactions are considered to be possible mechanisms for cementation. (Knapp-USGS)

SEDIMENT INVESTIGATION IN BIG SAND COULEE BASIN, WYOMING AND MONTANA,
Geological Survey, Worland, Wyo
Hugh W. Lowham
Geological Survey Open-file Report, Nov 1969. 20 p, 7 fig, 2 tab.

Descriptors: *Sediment transport, *Bed load, *Montana, *Wyoming, Sands, Sedimentation, Erosion, Sediment yield, Irrigation water, Return flow, Streamflow, Scour, Silting.
Identifiers: Big Sand Coulee (Wyo-Mont).

The erosion of streambanks and basin surface by storm and snowmelt runoff provides large amounts of sediment to streams in the Big Sand Coulee basin, Montana and Wyoming. Some sediment is carried into the Clarks Fork Yellowstone River and some is deposited in the channel of Big Sand Coulee. Small amounts of sediment are brought into the Big Sand Coulee by waste waters from the Heart Mountain Irrigation Project and from other irrigated lands. These waters pick up sediment from the streambed of Big Sand Coulee and transport it downstream but do not appear to be causing any accelerated erosion. Waste waters, return irrigation water, and groundwater inflow maintain a continuous flow and transport sediment continuously into Clarks Fork Yellowstone River. (Knapp-USGS)

IRON-RICH LAYERS IN SEDIMENTS FROM THE GULF OF MEXICO,
Texas Instruments, Inc., Dallas; and Kansas Univ., Lawrence. Dept. of Civil Engineering.
Jerry A. Watson, and Ernest E. Angino.

Journal of Sedimentary Petrology, Vol 39, No 4, p 1412-1419, Dec 1969. 8 p, 4 fig, 2 tab, 18 ref.

Descriptors: *Sediments, *Diagenesis, *Iron, Geochemistry, Gulf of Mexico, Water chemistry, Stratification, Sea water, Manganese, Cobalt, Trace elements, Pleistocene epoch, Carbon radioisotopes, Cores, Climates, Geology, Mapping, Analytical techniques, Statistical studies, Sampling, Carbonates.
Identifiers: Iron-rich sediments.

Thin yellow layers (0.5 to 2 cm) examined in seven cores in the west and central portions of the Gulf of Mexico are enriched in iron, manganese, cobalt, and nickel with respect to the surrounding sediments. The average enrichment is 66, 33, 51, and 28 percent, respectively. The highest correlation coefficients between single pairs of elements yield Co:Ni (r =0.53), Fe:Ni (0.64), Fe:Co (0.62), and Mn:Co (0.50). The yellow, iron-rich sediments commonly occur in the Pleistocene-Holocene transition zone and in the upper Pleistocene sediments. The iron-rich zones are considered to be the result of a reduced sediment accumulation rate. Carbon-14 dates support this argument. The close association with iron-stained foraminiferal tests in the sediments suggests post-depositional scavenging. The yellow layers are most prevalent on the lower continental slope, continental rise, and Sigsbee abyssal plain. (Gabriel-USGS)

THE EFFECT OF A PERMEABLE SAND BED ON SEDIMENT MOTION,
Georgia Inst. of Tech., Atlanta. School of Civil Engineering.
C. Samuel Martin, and Mustafa M. Aral.
Available from the Clearinghouse as PB-189 404, $3.00 in paper copy, $0.65 in microfiche. Water Resources Center, Georgia Institute of Technology, Completion Report WRC-0869, Nov 1969. 97 p, 2 tab, 46 fig, 20 ref, 1 append. OWRR Project B-019-GA.

Descriptors: *Sediment transport, *Seepage, *Sediment-water interfaces, *Permeable beds, *Stream-beds, *Slope stability, *Bed load, Porous media, Permeability, Sediment load, Suspended load, Porosity, Stream channel erosion.

The research objectives were to determine the criterion governing incipient sediment motion when a plane bed is subject to seepage through it and boundary-layer flow over it, and to determine the effect of the seepage force on sediment transport. Slope instability tests were conducted with seepage flow into and out of the bed using two sand columns, one square and the other circular in cross section. For uniform sand particles ranging from 0.46 mm to 0.72 mm in diameter, the seepage force on the interfacial sand grains was determined to be one-half the seepage force on particles well within the bed. Incipient-motion tests indicate that seepage may either enhance or hinder incipient motion, depending on the relative magnitude of the boundary shear stress and seepage force, both of which depend on seepage flow. For a given hydraulic gradient for seepage into a bed the size of the sand grains is critical regarding incipient motion. Incipient motion may be hindered for smaller sand grains but enhanced for larger sand grains. Seepage into a sand bed was found to not measurably impair sediment transport, unless fine particles are deposited in the bed. For practical values of hydraulic gradient, that is less than unity, the effect of seepage on incipient motion and sediment transport is not significant. (Conway-Georgia Tech)

THE CONCEPT OF ENERGY EFFICIENCY IN PRIMARY PRODUCTION,
Fisheries Research Board of Canada, Dartmouth (Nova Scotia). Bedford Inst. Lab.
Trevor Platt.
Limnology and Oceanography, Vol 14, No 5, p 653-659, Sept 1969. 2 fig, 2 tab, 10 ref.

Descriptors: *Primary productivity, *Photosynthesis, Solar radiation, Oceanography, Chlorophyll, Regression analysis, Estimating equations, Photometry, Biomass, Carbon radioisotopes, Fluorometry, Correlation analysis, Inhibition, Environmental effects, Nutrients, Temperature, Light intensity.
Identifiers: *Energy efficiency, Optical extinction coefficient, Depth effects, St Margaret's Bay (Nova Scotia), Nova Scotia, Canada, Precision, Error analysis, Extinction coefficients, Biological processes, Photobiology, Biological extinction coefficients, Radiocarbon uptake technique, Chlorophyll a, Coscinodiscus excentricus, Raritan Bay (Canada), Assimilation quotients, Chemical processes.

Establishment of truly dimensionless measures of energy efficiency may make possible the comparison of primary productivity of water masses. Coefficient, k-sub-b, which measures the contribution of photosynthetic processes to the total optical extinction coefficient is defined. Based on theoretical considerations and first-order simplifying approximations, k-sub-b, at any depth, is shown to be equivalent to the ratio, primary production to incident radiation at that depth, where each is expressed in calories. Values for k-sub-b, calculated for two stations in St Margaret's Bay, Nova Scotia, show that the coefficient, at any depth, is linearly dependent on concentration of chlorophyll a at that depth. Errors in estimating k-sub-b include errors in measurement of energy fixed, of incident radiation at water's surface, and of optical extinction coefficient. Precision in estimating k-sub-b would be improved by measurement of incident radiation at any depth with an in situ integrating radiometer. K-sub-b may represent a useful index for comparison of primary productivity of waters, and that its regression on concentration of chlorophyll a can be used as a predictive tool in studies of production. OCCURRENCE AND SIGNIFICANCE OF IRON, MANGANESE, AND TITANIUM IN GLACIAL MARINE SEDIMENTS FROM THE ESTUARY OF THE ST LAWRENCE RIVER,
Fisheries Research Board of Canada, Dartmouth (Nova Scotia). Bedford Inst.
D. H. Loring, and D. J. G. Nota.
Journal Fisheries Research Board of Canada, Vol 25, No 11, p 2327-2347, 1968. 5 fig, 4 tab, 26 ref.

Descriptors: *Sediments, Iron, Manganese, Titanium, Oxidation-reduction potential, Erosion, St Lawrence estuary, Glacial soils, Estuaries.
Identifiers: Sediment texture, Oxide films, Detrital minerals, Canadian Shield, Marine sediments.

Investigations of glacial marine sediments of Canadian Shield origin revealed small but significant modification of iron and manganese-bearing material produced by the present physicochemical conditions. Titanium was not affected by environmental influences. The content of elements was related to the texture of sediments, increasing in small-size fractions. (Wilde-Wisconsin)

THE EFFECT OF FRESH WATER ON THE REDISTRIBUTION OF URANIUM IN CARBONATE SEDIMENTS,
Rensselaer Polytechnic Inst., Troy, N.Y. Dept of Geology.
David S. Haglund, Gerald M. Friedman, and Donald S. Miller.
Journal of Sedimentary Petrology, Vol 39, No 4, p 1283-1296, Dec 1969. 14 p, 14 fig, 4 tab, 23 ref. NSF Grants GP 2691 and GP 5169.

Descriptors: *Diagenesis, *Uranium radioisotopes, *Carbonate rocks, *Sediments, Carbonates, Sampling, Geology, Sands, Calcite, Limestones, Carbon radioisotopes, Pleistocene epoch, Stratigraphy, Mineralogy, Recent epoch, Geochemistry.
Identifiers: *Bermuda, Israel.

Recent carbonate sands and their ancient analogs were studied in Bermuda and Israel in order to establish the effect of fresh water alteration on the distribution of uranium. The uranium and calcite concentrations show an inverse relation and indicate that calcite, the product of fresh water alteration, accepts less uranium than the original aragonite. The relationship between uranium and stable carbon and oxygen isotopes for the Bermuda samples is inconclusive, whereas the same plots for the Israeli Coast samples show a direct relationship between decreasing uranium content and increasingly negative delta values. In general as the

metastable minerals aragonite and Mg-calcite are removed from the sediment system in the change from unconsolidated carbonate sand to consolidated limestone, there is a concomitant decrease in uranium content. (Gabriel-USGS)

Chesapeake Bay Institute Technical Report 59, Reference 69-12, Johns Hopkins University, Nov 1969. 76 p, 19 fig, 1 tab, 36 ref, 1 append. Navy Proj No NR 083-016, Office of Naval Research Contract nonr 4010 (11).

Descriptors: *Current meters, *Turbulence, *Vortices, *Estuaries, Currents (Water), Streamflow, Calibrations, Instrumentation, Water circulation.
Identifiers: Doppler current meters, Acoustic current meters, Chesapeake Bay.

As part of a program to study naturally occurring fluid motions in the marine environment a meter was developed to sense high-frequency turbulence. The meter does not disturb the fluid at the point of measurement. It measures the entire velocity vector and it takes a vector average of measurements. The meter has been laboratory tested and used in the field. During the field tests, the conditions under which it was operated were far from optimal, but some useful data were obtained. At the small time scales involved there may exist significant vertical velocities in an estuary. The energy in the vertical turbulent fluctuations was less than in either horizontal direction. This rules out the possibility of isotropic turbulence at these scales of motion, for the estuarine conditions sampled. The current meter has the capability of operating effectively in the presence of a wave field. (Knapp-USGS)
W70-03259

TIDAL RELATIONS IN THE SOUTH BISCAYNE BAY AREA, DADE COUNTY, FLORIDA,
Geological Survey, Tallahassee, Fla.
James J. Schneider.
Geol Surv Open-file Report, Jan 1969. 16 p, 6 fig, 1 tab.

Descriptors: *Tides, *Florida, *Bays, Inlets (Waterways), Sea level, Urbanization, Shores, Tidal waters, Water levels, Water level fluctuations, Surveys, Data collections, Hydrologic data.
Identifiers: Dade County (Fla), Miami (Fla).

Development of the waterfront lands of southeast Dade County depends upon the construction of sea walls (bulkheads) and filling of the lowlying land. To assist Dade County officials in planning the development of the area, an investigation was made to determine the elevation of mean high water and tidal patterns in the south Biscayne Bay area. The results of the investigation are based on records collected from 10 tide gages during the period July 1, 1967 through June 30, 1968. Prior records from most of the gages were available for correlation. The elevation of mean high water was 1.5 feet in central Biscayne Bay and 0.9 ft in the lower bays. The mean tidal range was 2.0 ft in central Biscayne Bay and 0.5 ft in the lower bays. The difference between mean half tide and mean water level was found to be negligible at all stations. The time lag for high and low tides, referred to Miami Beach, was approximately one hour in Biscayne Bay and 6 hours at Manatee Bay. (Knapp-USGS)

INTERNAL STRUCTURE OF WAVE-FORMED RIPPLE MARKS IN THE NEARSHORE ZONE,
Kiel Univ. (Germany). Geological Inst.
Robert S. Newton.
Sedimentology, Vol 11, No 3-4, p 275-292, Dec 1968. 18 p, 7 fig, 2 plate, 1 tab, 27 ref.

Descriptors: *Ripple marks, *Waves (Water), *Sedimentary structures, Sedimentary petrology, Sedimentation, Sediment transport, Currents (Water), Sand waves, Tracers, Tracking techniques, Bed load.
Identifiers: Nearshore ripple marks.

Wave-formed ripple marks in the nearshore zones of the Baltic Sea (tideless) and North Sea (tidal) exhibit a unidirectional internal lamination identical to that of current ripples. This holds true whether the ripples are symmetrical or asymmetrical. In most cases wave-formed ripple laminae dip toward shore and can thereby provide a shoreline direction indicator when found in ancient sediments. The sediment transport direction, however, may be other than in the foreset laminae dip direction, and cross-lamination as a sediment transport direction indicator should be used with caution. Ripple height, wave length and the orientation of the ripple internal structure are dependent upon both the orbital diameter and the velocity of the positive component of oscillation of the waves forming them. The thickness of the individual laminae making up ripples is highly dependent upon sediment grain size; the role hydrodynamics plays is problematic. (Knapp-USGS)

NEPHELOID LAYERS AND BOTTOM CURRENTS IN THE ARCTIC OCEAN,
Lamont-Doherty Geological Observatory, Palisades, N.Y.
Kenneth Hunkins, Edward M. Thorndike, and Guy Mathieu.
Journal of Geophysical Research, Vol 74, No 28, p 6995-7008, Dec 20, 1969. 14 p, 8 fig, 3 tab, 15 ref. ONR Contracts Nonr 266 (82) and N00014-67-A0108-0016.

Descriptors: *Ocean currents, *Currents (Water), *Optical properties, *Turbidity, Instrumentation, Arctic Ocean, Photography, Suspension, Turbulent flow, Velocity, Topography, Water Circulation, Surface waters, Deep water, Organic matter, Mapping, Sounding, Transmissivity, Mathematical studies, Suspended load.
Identifiers: Nepheloid layers (Oceanography), Nephelometry.

Light scattering from nepheloid layers of the Arctic Ocean was investigated by using nephelometers and echo sounding. The zone of deep light scattering over oceanic ridges and rises is called the bottom nepheloid layer. At all the observation stations the strongest scattering occurred near the surface, decreasing with depth in the upper layers. The bottom nepheloid layer is evidently caused by fine material that is maintained in suspension by turbulent flow. Swifter current speeds occur over the ridges and suggest a counterclockwise deep circulation in the Canada basin. (Gabriel-USGS)

GEOLOGICAL AND MINERALOGICAL STUDIES OF SOME SAND DEPOSITS IN THE NILE DELTA, U.A.R.,
National Research Center, Cairo (Egypt). Earth Science Lab.
M. M. Kholief, E. Hilmy, and A. Shahat.
Journal of Sedimentary Petrology, Vol 39, No 4, p 1520-1529, Dec 1969. 10 p, 6 fig, 5 tab, 37 ref.

Descriptors: *Sedimentary petrology, *Deltas, *Estuaries, *Sediments, *Sands, Mineralogy, Geology, Rivers, Sampling, Mapping, Environment, Alluvium, Silts, Clays, Particle size, Statistical methods, Chemical analysis.
Identifiers: Nile Delta.

Samples of sediments from the Nile Delta were investigated by mechanical, chemical, and mineralogical analyses. Sand islets have a general lithologic uniformity and are commonly characterized by graded bedding and ripple marks. The sands are from moderately to well sorted and exhibit no significant differences in the mean roundness of grains. Small amounts of iron oxide and carbonates coat the quartz grains. Two heavy mineral assemblages were found. (Gabriel-USGS)

CATALOG OF TSUNAMIS IN THE HAWAIIAN ISLANDS,
Coast and Geodetic Survey, Rockville, Md.
George Pararas-Carayannis.
Available from US Dept of Commerce, Environ Sci Serv Admin, Coast and Geodetic Survey. World Data Center A Rep WDCA-T 69-2, May 1969. 94 p, 2 tab, 146 ref, index.

Descriptors: *Tsunamis, *Hawaii, *Data collections, *Bibliographies, Ocean waves, Waves (Water), Earthquakes, Pacific Ocean.
Identifiers: World Data Center.

All available data pertaining to tsunamis in the Hawaiian Islands are compiled. An extensive bibliography is included. All the available information has been compiled from historical accounts, newspaper archives, other reports, and recent mareographic data. Most of the events listed are associated with earthquakes, but some are associated with volcanic activity. Others, which do not show an association with earthquakes near the places of observation, may have been tsunamis of distant seismic origin for which there is no record. Most of the destructive tsunamis in the Hawaiian Islands have been generated along the coast of South America, the Aleutian Islands, the Kamchatka Peninsula, and Japan. The number of locally generated tsunamis is very small. (Knapp-USGS)
W70-03476

RECENT SEDIMENTATION IN NORTHERN CARDIGAN BAY, WALES,
Wisconsin Univ., Madison.
J. Robert Moore.
Bulletin of the British Museum (Natural History), Mineralogy Series, Vol 2, No 2, p 21-131, Feb 1968. 110 p, 47 fig, 7 tab, 70 ref.

Descriptors: *Sedimentation, *Estuaries, *Bays, Petrography, X-ray analysis, Mineralogy, Chemical analysis, Trace elements, Geochemistry, Streams, Sands.
Identifiers: *Cardigan Bay (Wales).

Marine sediments in the shallow waters of northern Cardigan Bay, Wales, are dominantly fine-grained sands that have been well sorted by active tidal and longshore currents. Minor accumulations of bimodal deposits of sand and gravel are present near the sarns, and at the base of the eroding coastal cliffs. The bay deposits are composed of 6 common minerals: quartz, muscovite, chlorite, orthoclase, plagioclase, and calcite. Rarely, minor amounts of dolomite are present. Based on their gross mineral content, the deposits are classified as quartzose sands, with a few being subgreywackes, or sublithic sands. Charted dispersal patterns indicate local sources along the coast, namely eroding exposures of glacial debris and sea-cliffs of slates and greywackes. Spectrochemical data are reported, and elemental distributions in the bay sediments charted. Distribution patterns of certain elements associated with accessory minerals define zones of tidal currents, while elements related to aluminosilicates largely indicate the locations of eroding coastal exposures currently supplying detritus to the bay. Most of the bay sands are derived from coastal erosion sites and not from sources inland; streams are not active suppliers of sand to the bay; estuaries are being infilled from the sea; net transport of sediment is northward inshore, but seaward, in part, offshore; and that the present bay sands would have the desirable features of a reservoir rock if they were buried in the subsurface. (Gabriel-USGS)

RECENT SEDIMENTATION IN THE BERING SEA,
Akademiya Nauk SSSR. Institut Okeanologii.
A. P. Lisitsyn.
CFSTI Translation No TT 68-50315, 1966. 614 p, 187 fig, 102 tab, 544 ref.

Descriptors: *Sedimentation, *Marine geology, Analytical techniques, Sampling, Mapping, Climates, Permafrost, Continental shelf, Continental slope, Soils, *Glaciation, Water chemistry, *Bottom sediments, Mineralogy, Petrography, Organic matter, Biogeography.
Identifiers: Bering Sea, Recent sedimentation.

The Bering Sea is one of the largest marine basins of the globe, with an area of 2,257,541 sq km. It is also the deepest sea washing the shores of the USSR. It has a maximum depth of 4,420 m, equal to the mean depth of the Pacific and exceeding the mean depth of the World Ocean. The Bering Sea lies on the boundary between the glacial and the temperate zones. It is probably singular in this respect, making possible studies of all the details of sedimentation in these zones and the transition regions between them, as well as research into the variations of the positions of these zones in the geological past. The depth of the Kamchatka Strait exceeds the maximum depth of the sea so that Pacific Ocean waters penetrate throughout this basin. The narrow and shallow Bering Strait connects the Bering Sea with the Arctic Ocean. Its maximum depth is only 58 m, its average depth 30-50 m, and its width 85 km, and at times of low sea level the strait may have been a land bridge to North America. Marine conditions are most distinct in the northern and eastern parts of the sea, while oceanic conditions dominate in the deep basins in its southern part. The Bering Sea lies within the northern belt of Pacific diatomaceous oozes. It is therefore possible to study the results of combined effects of terrigenous and biogenic siliceous sedimentation. Luh C. Tao, Richard Myers, and Dennis Kos.
Available from the Clearinghouse as PB-189 403, $3.00 in paper copy, $0.65 in microfiche. Water Resources Research Institute Project Completion Report, Nebraska University, Jan 24, 1969. 21 p, 5 fig, 3 tab, 8 ref. OWRR Proj No A-010-NEB.

Descriptors: *Films, *Saline water, *Scaling, Heat transfer, Calcium sulfate, Evaporators, Research and development, Coatings, Boilers, Feeding rates.
Identifiers: Polyfluorocarbon boiler-tube coatings.

Desalination evaporator scaling was considerably reduced by a thin polyfluorocarbon coating on boiler tubes. Coatings of 'McLube', made by McGee Chemical Company, less than 0.001-inch thick improved the heat transfer rate about 70% to 130% relative to the uncoated tubes. The initial small boiler was then modified in order to allow continuous feed of calcium sulfate solutions. The coating performance exhibited more improvement with (1) moderate feed rates of salt solution and (2) high temperature difference across the tube wall. The results from the small boiler were confirmed in a larger pilot scale boiler. The feasibility of using a low-adhesion coating to reduce scaling on evaporators has been established. Further study on durability of coatings and possible combination with seeding the feed solution is recommended. (Carstea-USGS)

Descriptors: *New Jersey, *Reservoirs, *Administrative agencies, *Water supply, Dams, Water works, Planning, Water control, Legislation, Regulation, Government finance, Rivers, River flow, Gaging stations, Dam construction, Projects, Project planning, Project purposes, Domestic water, Industrial water.

The Division of Water Development is created in the Department of Conservation and Economic Development and shall consist of a five-member Board appointed by the Governor. The members shall serve without compensation for terms of from one to four years. The Board shall acquire and operate a water supply system to be known as the New Jersey Water Supply System. The System shall include a reservoir near Chimney Rock in Somerset County adequate to initially yield 70,000,000 gallons daily. Upon further authorization from the legislature the yield shall be increased to 200,000,000 gallons daily. Other reservoirs and facilities to provide increased water supply for domestic and industrial uses are authorized. The Board may expend $60,000,000 from the proceeds of the New Jersey Water Supply Bond Act for construction of the Chimney Rock Reservoir and compensating facilities on the Raritan River to assure a minimum daily flow of 130,000,000 gallons to be measured at the Bound Brook gaging station. Remaining funds under the Act may be expended as specifically authorized by law for planning, water supply investigations, and additional facilities. (Kahle-Florida)

3D. Conservation in Domestic and Municipal Use

WATER SUPPLY, SANITATION, AND DITCHES (COUNTY WATER SUPPLY SYSTEMS).
Ohio Rev Code Ann secs 6103.06-6103.30 (Page 1953), as amended, (Supp 1970), secs 6103.081, 6103.31 (Supp 1970).

Descriptors: *Ohio, *Water supply, *Water management (Applied), Water works, Utilities, Water distribution (Applied), Financing, Legislation, State governments, Administrative agencies, Regulation, Local governments, Sanitary engineering, Public health, Legal aspects, Sewage districts.

Procedures for the construction of proposed improvements by water supply districts are outlined in the statute. The board of county commissioners may issue and sell bonds to finance the improvement. Bids are let for the construction of the improvement to be accepted or rejected by the board. A petition to waive procedural safeguards to hasten construction may be made to the board by the landowners to be benefitted. All property benefitted by the improvement shall be ratably assessed. Methods and terms of assessment payments are outlined. Certification of assessments are made by the county auditor. The Department of Health can require improvements to be made by the board, if they believe that unsafe water conditions exist in the county. Such demands are subject to court review. Water may be supplied beyond the district. Existing private water works of good quality may be purchased by the board. Eminent domain proceedings may be brought or property may be purchased when land is needed by the board to effect the provisions of this act. (Barnett-Florida)

WATER SUPPLY TO THERMAL POWER PLANTS,
Sargent and Lundy, Chicago, Ill.
E. J. Stankiewicz.
Journal of Power Division, Proceedings of the ASCE, Paper 1889, p 1-23, Dec 1958. 14 fig.

Descriptors: *Cooling water, *Thermal power plant, Condensers, Cooling towers, Pipes.
Identifiers: Closed circulation system, Direct circulation system, Circulating water pumps, Spray ponds, Crib houses, Cooling ponds.

Water supply to thermal power plants is the chief factor in locating plant sites, because of cooling water requirements, and accounts for the largest single nationwide water use. Total thermoelectric capacity of the country for 1957 was 102 million kw, with a 0.59 capacity use factor, condenser cooling water amounts to 70 billion gallons per day, equivalent to 27% of our total national use of 261 billion gallons. Sources of circulating water supply maybe natural or man-made. Two basic types of circulating water systems are direct circulation and closed circulation. In the direct circulation system, water is pumped directly from source to condenser and is discharged downstream of the source. Over 70% by water use was direct circulation in 1957. Examples of each type of use are given. There is no reuse of water in direct circulation. Arrangement of circulating water systems depends primarily on the basic type of system, the total height through which the water must be lifted and whether the plant is a grade level or a basement type station. The extent of hydrographic and hydraulic studies in developing and delivering the water supply and with reference to main building substructure depends to a great extent on whether the station has a river or a lake source with direct circulation or any closed circulation system. The trend has been to use a pipe for the intake line, with the circulating water pumps in the crib house, as this combination tends to reduce costs in several ways. Illustrated examples of direct circulation river stations and closed circulation stations are given. (Upadhyaya-Vanderbilt)

Descriptors: *Water resources development, *Puerto Rico, *Water management (Applied), Groundwater, Surface waters, Irrigation water, Water supply, Sewage treatment, Water pollution control, Flood control, Land management, Water sources, Evapotranspiration, Water law, Water rights.
Identifiers: Water resources management.

The present status of water resources management in Puerto Rico is reviewed. Topics discussed include the island's hydrology, streamflow, water availability, water use, water rights, predictions of future needs, water problems, and recommendations. The major problems are pollution control, reservoir sedimentation, flood control, irrigation needs, drainage, and salt water intrusion. Puerto Rico is rapidly industrializing and must solve these problems to continue increasing the standard of living. (Knapp-USGS)

FLOOD PLAIN INFORMATION, BLACK CREEK AND GENESEE RIVER IN THE TOWNS OF CHILI AND RIGA, MONROE COUNTY, NEW YORK.
Corps of Engineers, Buffalo, N.Y.

Report prepared for Genesee River Basin Regional Water Resources Planning Board. Corps of Engineers Flood Plain Report, Sept 1969. 48 p, 12 fig, 13 plate, 14 tab.

Descriptors: *Floods, *Flood damage, *New York, Flood plains, Flood control, Non-structural alternatives, Maximum probable flood, Historic flood.
Identifiers: Monroe County (NY), Standard project flood, Intermediate regional flood.

Flooding of Black Creek and Genesee River in Chili and Riga, Monroe County, New York is described in a report of flood plain problems based on records of rainfall, runoff, and historical and present flood heights. Maps, photographs, profiles, and cross sections indicate the extent of flooding that has occurred and which may be expected to occur in the future. The information is for use in study and planning ways to minimize vulnerability to flood damages by control of flood plain use by zoning and subdivision regulations, the construction of flood protection works, or by combinations of these approaches. (Knapp-USGS)

PENN CENTRAL CO V BUCKLEY AND CO, INC (RAILROAD DENIED INJUNCTIVE RELIEF).

415 F2d 762-764 (3d Cir 1969).

Descriptors: *Navigable waters, *Railroads, *Bridges, *Boats, Admiralty, Legal aspects, Rivers, New Jersey, New York, Navigable rivers, Navigation, Transportation, Damages, Remedies, Judicial decisions.
Identifiers: Injunctions (Prohibitory).

The plaintiff, a railroad that owned and operated a draw bridge, was denied an injunction restraining certain tug boat operations. The court of appeals found that plaintiff had failed to show that monetary compensation would not provide adequate relief in the event of injury to the bridge or delays in rail traffic. The court considered navigation as the paramount use of the waterways; it treated bridge piers as tolerated obstructions. (Casey-Florida)

PIRMAN V FLORIDA STATE IMPROVEMENT COMM'N, AND STATE RD. DEP'T OF FLORIDA (BRIDGE CONSTRUCTION).

78 So2d 718-722 (Fla 1955).

Descriptors: *Bridge construction, *Florida, *Judicial decisions, *Riparian rights, Remedies, Riparian land, Bridges, Property values, State governments, Administrative agencies, Decision making, Economics, Project planning, Construction costs.

Certain property owners attacked the determination by an administrative agency of the location of a bridge to be constructed through a bay in connection with a road. They attempted to forestall construction of the bridge and brought suit contending that: (1) the legal description of the Palma Sola Bay Bridge was so indefinite that the actual location could not be determined and the determination of a lawfully constituted administrative authority was therefore arbitrary and capricious; (2) running the roadway through Palma Sola Bay violated the property rights of appellants owning riparian property on the Bay, north of the crossing. The suprmeme court, in affirming the lower court, held that there was no constitutional authority to the effect that the location of the bridge should be fixed with such certainty that it could be located by a surveyor, a prerequisite to issuance or validation of bonds. Nothing was evidenced to show that action by the board of county commissioners or any other lawfully constituted board was arbitrary and capricious. Therefore, the supreme court would not substitute its judgement for that of the boards in question. The riparian owners on the north shore of the Bay, who did not hold any property to be acquired in the building of the bridge were without right to compensation for violation of property rights. (Moulder-Florida)

LEVEE DISTRICTS.
Miss Const art 11, secs 227 thru 239 (1890).

Descriptors: *Mississippi, *Levees, *Water districts, *Administrative agencies, Boundaries (Property), Taxes, Tax rate, Assessments, Legislation, Mississippi River, Maintenance, Right-of-way, Construction, State governments, Legal aspects, Water policy, Zoning, Repairing, Administration, Management, Federal government, Supervisory control (Power).
Identifiers: *Alluvial land, Levee districts.

The Yazoo-Mississippi Delta Levee District and the Mississippi Levee District encompass and divide the alluvial land of the state for levee system purposes. Each district has a board of levee commissioners, and provision for their membership, qualifications, election, and bonding is detailed. Such commissioners shall have the power: (1) to supervise the erection, repair, and maintenance of levees in their respective districts; (2) to cede their rights of way and levees to the United States; and (3) to appropriate private property. No bills changing the boundaries of the district, or affecting the taxation or revenue of the district may be considered without proper publication. Each levee board makes an annual report to the Governor. The legislature shall: (1) levy a uniform tax upon lands in each levee district; (2) authorize the levee boards to fix the annual rate of taxation; (3) have the full power to provide a system of taxation for said levee districts; and (4) require the levee boards to publish an itemized account of their receipts and appropriations. No property between the levee and the Mississippi River shall be taxed for levee purposes. (Schram-Florida)

WALLACE V SCHNEIDER (SURFACE DRAINAGE).

219 SW2d 977-982 (Ky Ct App 1949).

Descriptors: *Kentucky, *Drainage water, *Diversion, Judicial decisions, Drainage systems, Surface runoff, Drainage, Drains, Channels, Culverts, Ditches, Sewers, Surface drainage, Riddance (Legal aspects), Surface waters, Drainage effects, Damages, Alteration of flow, Legal aspects.
Identifiers: Injunctions (Prohibitory).

An adjoining landowner constructed a system of drains, culverts, ditches, and gutters. Appellants alleged that this construction caused water to be discharged in unnatural quantities and at unnatural places on their land and to their damage. The lower court refused to grant an injunction to enjoin appellees from maintaining the aforementioned ditches, culverts, and drains. An appeal was taken. The lower court's decision was affirmed. The court held that the owner of the dominant estate may drain and ditch his land to rid it of surface water by construction of sewers, drains, and culverts without liability to the owner of the servient estate for damage, even though the flow of surface water onto the servient estate is thereby accelerated, so long as he does not: (1) tap additional watersheds or; (2) divert surface water from natural drains in which ditches, gutters, sewers, or culverts are constructed. The evidence presented sustained a finding that provisions (1) and (2) had not been violated. (Moulder-Florida)

PATY V TOWN OF PALM BEACH (GROIN-ORIGINATING LAND DAMAGE).

29 So2d 363-364 (Fla 1947).

Descriptors: *Florida, *Judicial decisions, *Breakwaters, Sea walls, Check structures, Jetties, Ocean waves, Shore protection, Barriers, Retaining walls, Coastal structures, State jurisdiction, Scour, Washouts, Wave pile-up, Damages, Cities.

The city of West Palm Beach had been authorized to construct seawalls, bulkheads, and groins to protect against destruction by the ocean. The implimentation of the foregoing authorization resulted in the alleged damage of plaintiff's land. Damage, to be actionable, must be coupled with negligence or misconduct. No action for damages arises from conduct of people in the execution of a public trust for the public benefit when such conduct reflects due skill and caution and is within the scope of authority. Here, the city was being sued for the alleged damages resulting from an authorized act. The resulting damage was damage without injury, hence the land owners could not recover from city. DRAINAGE.

Ill Ann Stat ch 42, secs 10-1 thru 10-11 (Smith-Hurd 1956), as amended, (Supp 1969).

Descriptors: *Illinois, *Administration, *Water management (Applied), *Drainage districts, Legislation, Regulation, Drainage, State governments, Drainage systems, Drains, Levees, Administrative agencies, Economics, Legal aspects, Local governments.

When a petition praying for the abandonment of construction in a drainage district is filed with the court before a contract for such construction is entered, the court shall order the district commissioners to abandon such work. Similar procedures are available to cause abandonment of a portion of the proposed work. The procedure for abandonment in districts, subdistricts, and minor subdistricts is the same. The court may, upon petition by land owners, dissolve a drainage district. Provisions for such dissolution are set forth. If an order is entered by the court dissolving a district, the commissioners of the district become trustees vested with title to all real and personal property of the district. This property may be sold. Subdistricts and minor subdistricts, upon petition of land owners, may be dissolved in the same manner as provided for main districts. Whenever a district, subdistrict, or minor subdistrict has been dissolved, all drains and levees are deemed to be for the mutual benefit of the lands formerly in the district. (Moulder-Florida)

TILE CLOGGING BY IRON AND MANGANESE IN IMPERIAL VALLEY, CALIFORNIA,
Agricultural Research Service, Brawley, Calif.
Luther B. Grass.
J Soil Water Conserv, Vol 24, No 4, p 135-138, July-Aug 1969. 4 p, 7 fig, 2 tab, 19 ref.

Descriptors: *Drain tiles, *Tile drains, *Iron oxides, Manganese compounds, Drainage, Drainage engineering, Drainage systems, Tiles, Tile drainage, Drains, Deposition, Chemical precipitation, Soil types, Operation and maintenance, Irrigation operation and maintenance, Bibliographics, Iron bacteria.
Identifiers: *Clogging, Imperial Valley (Calif), Imperial Irrigation District (Calif).

Tile drains are used extensively in the Imperial Valley of California to control water tables and prevent salt accumulation in soils. By 1955, water tables had developed over some tile lines, reducing

crop growth either by restricting root growth or by increasing salinity. When opened for inspection, the lines were found clogged by black and red deposits composed of manganese and iron oxides. Theories proposed to explain the deposits are: (1) the problem predominates near faults, (2) the problem is peculiar to certain soil textures, and (3) the type of tile used contributes to the problem. A survey was made of tile lines in the Imperial Valley. The severity of clogging varied widely and the deposits were observed in various physical forms. The survey indicated that formation of red or black deposits was not related to location, soil type, kind of tile material, or length of time the drains had been in service. Tile systems clogged with iron and manganese deposits can be reclaimed effectively by treatment with sulfur dioxide gas and water. (USBR)

CONSERVANCY DISTRICTS (WATERCOURSES, WATER RIGHTS AND USES, AND CONSTRUCTION AND MAINTENANCE OF RECREATIONAL FACILITIES).

Ohio Rev Code Ann secs 6101.20 thru 6101.25 (Page 1953), as amended, (Supp 1970), sec 6101.241 (Supp 1970).

Descriptors: *Ohio, *Administrative agencies, *Water utilization, *Water conservation, Bridges, Structures, Aqueducts, Streams, Sewers, Pipelines, Streamflow, Rainfall, Excavation, Channels, Flood control, Domestic water, Federal government, Drainage, Recreation, Soil erosion, Parks, Water supply, Riparian rights, Industrial water, Irrigation, Fisheries.

The court may order owners of bridges or structures over watercourses to remove or modify such structures pursuant to a district plan. If such changes are not made, the Board of Directors of Conservancy Districts can make them. The Directors have the power to improve watercourses. Private owners shall bear the cost of improvements required because of interference with water flow. Owners of bridges or grades shall provide access for dredge boats or other equipment. The Directors may make surveys and investigations of rainfall and stream flow and may provide for flood warning services. The Directors may enter into contracts with the United States Government or other public or private agencies for the development and maintenance of waters, parks, and recreational facilities. The rights of water users to the waters of the District shall remain the same, but the District will become the owner of improvements which it constructs. If the District is a riparian owner it has riparian rights. The District shall be compensated for the use of its waters. The Directors may construct and maintain recreational facilities. (Duss-Florida)
W70-03395

COUNTY WATER SUPPLY SYSTEMS.
Ohio Rev Code Ann secs 6103.01-6103.05 (Page 1953), as amended, (Supp 1970), secs 6103.051, 6103.052 (Supp 1970).

Descriptors: *Ohio, *Water supply, *Permits, *Administrative agencies, Legislation, State governments, Local governments, Water works, Water distribution (Applied), Equipment, Financing, Water conveyance, Sanitary engineering, Sewers, Water sources, Consumptive use, Water utilization, Legal aspects.

Public water supply is defined as wells, streams, and other sources, and the equipment necessary for the distribution of the water supply. The board of county commissioners of any county may acquire and operate any water supply within its boundaries. The board shall issue and enforce rules and rates regarding such supply. Permission for any construction regarding the supply must first be granted by the board. The board's authority for the supply located within a municipal corporation shall extend to main works only. The municipal corporation's legislative body may expand the board's authority. The board will retain jurisdiction over sewer districts annexed to a municipal corporation for water works purposes until all plans or improvements in progress are completed or abandoned. The county sanitary engineer shall submit a general plan for water supply to the board for approval. All assessments for water supplied may be deferred for good cause by the board. An advance of money from the water and sewer rotary fund can be made to cover the amounts not collected because of deferred assessments; advances by the fund are limited to the cost of authorized improvements. Repayment procedures are outlined. (Barnett-Florida)

WATER SUPPLY--SANITATION--DITCHES (DEVELOPMENT OF WATER RESOURCES BY COUNTY COMMISSIONERS).
Ohio Rev Code Ann secs 6131.01 thru 6131.13 (Page 1953), as amended, (Supp 1970).

Descriptors: *Ohio, *Water conservation, *Water management (Applied), *Water resources development, Legislation, Legal aspects, Benefits, Ditches, Drains, Watercourses (Legal), Rivers, Levees, Embankments, Dams, Reservoirs, Streams, Lakes, Bridges, Flood control, Water utilization, Administrative agencies, Construction, Water resources, Surplus water, Financing, Estimated costs, Water policy, Regulation, Federal government, Cost-benefit theory.
Identifiers: *Improvements.

Improvement means the construction or beneficial alteration of any ditch, drain, watercourse, levee, wall, embankment, dam, or reservoir. Benefits means advantages resulting from drainage, conservation, control, and management of water. Benefits include the following: (1) elimination or reduction of flood damage; (2) removal of water conditions that jeopardize public health, safety or welfare; (3) resulting increased land values; (4) use of water for irrigation, storage, regulation of stream flow, soil conservation or water supply; and (5) providing an outlet for accelerated upland runoff. Boards of county commissioners may authorize improvements if they find that the improvement will be conducive to the public welfare and that the cost of the improvement will be less than the benefits conferred by its construction. Landowners and government agencies may petition boards to authorize improvements. The procedure to be followed in filing and amending petitions, posting bond for the cost of determining feasibility of the proposed improvement, viewing the site of the proposed improvement, preparation of preliminary cost estimates and conducting a hearing on the propsed improvement is in each case set forth. Boards may construct a complete or coordinating system of water conservation and flood control. (Keith-Florida)
W70-03401

WATER SUPPLY - SANITATION - DITCHES (DRAINAGE IMPROVEMENTS).

Ohio Rev Code Ann secs 6131.14, 6131.47, 6131.59, 6131.63, 6131.64 (Page 1953), as amended, (Supp 1970), 6131.631 (Supp 1970)

Descriptors: *Ohio, *Surface drainage, *Ditches, *Drains, Legislation, Legal aspects, Administrative agencies, Surveys, Planning, Structures, Estimates costs, Construction, Assessments, Boundaries (Property), Drainage, Natural resources, Easements, Culverts, Bridges, Contracts, Floodgates, Watercourses (Legal), Damages, Channels, Maintenance, Highways, Public utilities, Drainage engineering.
Identifiers: *Improvements.

The board of county commissioners will send a copy of its findings in favor of drainage improvements to the county engineer. The engineer will make a survey of and plans for the proposed improvement. The engineer will send such plans, along with cost estimates, to named administrative agencies for their approval. Upon receipt of approval, the engineer will forward the approved plans and cost estimates to the board. The engineer may direct the owner of any culvert, bridge, fence or floodgate to remove or alter the same when necessary for the construction of an improvement. The owner will be compensated for damages. When an improvement consisting of a ditch, drain or watercourse has been used as the outlet of agricultural drainage for seven years or more, it will be deemed to be a public watercourse. The public will have the same rights therein as it would in a natural watercourse. Owners of adjacent lands may agree to construct a mutually beneficial ditch or drain. When such agreement is filed with the county auditor, the ditch or drain is established as a public watercourse. If the board declares an improvement vacated, private rights in the improvement will not be affected. (Keith-Florida)
W70-03402

WATER SUPPLY - SANITATION - DITCHES (INTERSTATE COUNTY DITCHES).

Ohio Rev Code Ann secs 6135.01 thru 6135.27 (Page 1953), as amended, (Supp 1970).

Descriptors: *Ditches, *Interstate, *Ohio, *Drainage systems, Cooperatives, Drains, Drainage, Conduits, Distribution systems, Diversion structures, Drainage engineering, Statutes, Legislation, Local governments, Cost analysis, Costs, Projects, Project benefits, Engineers estimates, Project feasibility, Cost allocation, Outlets.
Identifiers: *Interstate county ditches.

A joint board to supervise interstate county ditch projects shall be composed of the boards of county commissions of counties affected in Ohio and those boards affected in adjoining states. The procedure, powers, and duties of the joint board at the organizational meeting are established. The duties of the engineer appointed by the joint board are enumerated. Specific regulations set forth the rules governing subsequent joint board meetings. The power to enter upon lands in Ohio in connection with interstate county ditch projects is delegated to the proper authorities in the adjoining state. Project costs are apportioned and lands not mentioned in the first engineer report may be assessed. Ohio boards of county commissioners are permitted to conduct work beyond the state limits if authorized by the adjoining state. Procedures concerning claims for compensation and damages are provided. Water outlet projects located in either Ohio or an adjoining state are regulated. The methods of financing or assessing the costs of such projects are prescribed. The boards of county commissioners in Ohio must record in their journals the details of all interstate county ditch agreements. Absent specific interstate county ditch provisions, the laws governing Ohio county ditches control. (Powell-Florida)
W70-03403

WATER SUPPLY--SANITATION--DITCHES.

Ohio Rev Code Ann secs 6139.01 thru 6139.06 (Page 1953).

Descriptors: *Ohio, *Ditches, *Drains, *Drainage systems, Subsurface drains, Drainage, Conduits, Distribution, Systems, Diversion structures, Drainage engineering, Controlled drainage, Subsurface drainage, Surface drainage, Legislation, Local governments, Cost analysis, Projects, Project benefits, Cost allocation, Outlets.
Identifiers: *Township ditches.

A petition to improve a ditch or drain located within a township and having an outlet in a public watercourse may be filed with the clerk of such township. The work and material for construction of an improvement are apportioned among the landowners according to the benefits received. If the owner does not construct his portion of the improvement, the cost of such township ditch improvement will be assessed to the landowner. The rights and remedies afforded to a landowner affected by an improvement are provided in sections 6131.01 to 6131.64, inclusive of the Revised Code. The jurisdiction of the boards of county commissioners and boards of township trustees in regard to location of ditches is provided. The procedures to be followed for locating underground drains on land adjoining upland owners and for compensating the lower landowner are regulated. (Powell-Florida)
W70-03404

CONSERVATION OF NATURAL RESOURCES (WATER IMPROVEMENTS).

Ohio Rev Code Ann secs 1523.01 thru 1523.20 (Page 1964), as amended, (Supp 1970).

Descriptors: *Ohio, *Flood control, *Water conservation, *Navigation, Legislation, Dams, Legal aspects, Canals, Administrative agencies, Surplus water, Public health, Safety, Reservoirs, Dikes, Planning, Financing, Contract administration, Contracts, Hydroelectric power, Jurisdiction, Bridges, Culverts, Surveys, Construction, Maintenance, Riparian rights, Water supply, Estimated costs.
Identifiers: *Water improvements, Storage basins, Emergencies, Slack-water dams.

The Chief of the Division of Water is authorized to construct such reservoirs, dams, storage basins, dikes, canals, raceways and other improvements as are necessary for the following purposes: (1) to insure and promote the public health, welfare and safety; (2) to encourage and promote agriculture, commerce, manufacturing and other public purposes; and (3) to preserve the use of waters required for navigation. The Chief may also make additions to, enlarge, and alter existing improvements for such purposes. Before the Chief begins any such construction, he will submit plans and cost estimates of the proposed improvement to the Governor for approval. The procedure to be followed by the Chief in issuing bonds to finance improvements is delineated. The procedure to be followed by the Chief in the letting and administering of contracts for the construction or maintenance of improvements is set forth. The Chief may sell or lease water and power from future and existing improvements unless to do so would be detrimental to canal navigation. Bonds issued on improvements constitute a lien which may be foreclosed. No reduction in the quantity or quality of the water supply of any city is authorized by this chapter. (Keith-Florida)

WATERS, WATERWAYS, DRAINS AND LEVEES (WATERCOURSES).

Tenn Code Ann secs 70-101 thru 70-121 (1956).

Descriptors: *Tennessee, *Navigable waters, *Water resources development, *Navigation, Navigable rivers, Riparian rights, Riparian waters, Ships, Boats, Transportation, Sluices, Sluice gates, Regulation, Channels, Diversion structures, Highways, Administration, Administrative agencies, Railroads, Bridges, Fish, Fish barriers, Fish migration, Stream improvement, Mill dams, Mills, Legislation, Legal aspects.

All navigable waters are public highways. The quarterly county court may contract to open or clean out any navigable stream within the county. Overseers may be appointed for such navigable stream districts as the county may lay off, and regulations therein shall be the same as in the case of public roads. Court appointed supervisors of water improvements shall investigate and prosecute all offenses committed in regard to streams. It is unlawful to divert water from or to obstruct the navigation of the main or natural channel of any navigable watercourse. The water of any sluice may be diverted into a main channel for the immediate passage of a boat but must be returned so as not to impair the profit of the mill. The county court may permit and/or remove local improvements and erections in watercourses provided navigation is not interrupted. The court may appoint commissioners to see that local erections conform to law and allow the free passage of fish. Railroad companies shall operate drawbridges according to set standards. All eleemosynary institutions shall have the right to obtain property for the purpose of procuring water. (Smith-Florida)

LEVEE AND DRAINAGE DISTRICTS.
Tenn Code Ann secs 70-901 thru 70-914 (1956), as amended, (Supp 1969).

Descriptors: *Tennessee, *Drainage districts, *Financing, *Assessments, Levees, Flood control, Flood protection, Legislation, Administrative agencies, Construction, Construction costs, Drainage engineering, Drainage programs, Drainage systems, Taxes, Payment, Tax rate, Costs, Cost-benefit ratio, Cost-benefit theory, Benefits, Evaluation.

When a levee or drainage district is established, the county court shall appoint three uninterested commissioners from the county, one of whom shall be an engineer. The commissioners shall assess all lands benefited by the levee or drainage district by the amount of benefit and equitably apportion the expenses, construction costs, and damages for such improvement. All of the above information, as well as the description and ownership of the land, shall be reported to the county court. Any railroad or public highway will be assessed for any benefit received from the levee or drainage district's improvements. (Schram-Florida)
W70-03416

ESTABLISHMENT OF DRAINAGE DISTRICTS BY MUTUAL CONSENT.
Tenn Code Ann secs 70-1701 thru 70-1703 (1956).

Descriptors: *Tennessee, *Drainage districts, *Ditches, *Drains, Legislation, Jurisdiction, Drainage systems, Construction, Locating, Sites, Damages, Assessments, Benefits, Judicial decisions, Watercourses (Legal), Drainage programs.

The owners of land which require combined drainage may provide for the establishment of a drainage district or the location and construction of drains, ditches, and watercourses upon their own lands. Such an agreement may specify the location, the character of work to be done, the adjustment of damages, the classification of lands to be benefited, the amount of special assessments, and the time for levying assessments. Upon filing the agreement with the clerk of the county court, the court shall establish such drainage district and locate the ditch, drain, or watercourse as provided in the agreement. The court shall have complete jurisdiction over the parties and the subject matter. (Schram-Florida)

WATER RESERVOIR SYSTEMS.
Autonetics Division of North American Rockwell Corporation, Anaheim, California, Life Sciences Operations.

Available from the Clearinghouse, Vol 1, PB-189 340, Vol 2 as PB-189 341, $3.00 each in paper copy, $0.65 each in microfiche. Final Report of North American Rockwell Corporation to Office of Water Resources Research, Department of Interior, 2 Vol: Vol 2, Nov 1, 1968. 184 p, 53 fig, 35 tab, 26 ref, 1 append Vol 2, Dec 22, 1969. 73 p, 17 fig, 13 tab, 24 ref. OWRR No C-1187 (1595).

Descriptors: *Flood control, *Cities, *Urbanization, *Reservoirs, Costs, Cost-benefit analysis, Drainage systems, Economics, Social aspects, Dams, Multiple-purpose projects.
Identifiers: *Urban flood-control reservoirs.

Water reservoir systems were investigated for urban areas as an alternative or complement to storm water drainage systems for flood control which could provide benefits in water conservation and reduce drainage system costs. Santa Maria, California, was selected as a study site. Santa Maria has characteristics of seasonal rainfall that cause urban flooding, a need for water conservation (dropping water table), and high underground water percolation rates that favor a reservoir system. The study included a total of 8,000 acres of which 2,500 acres are highly urbanized, 3,800 acres represent future urban development and 1,700 acres are projected as agricultural through the year 2000. The Stanford Watershed Model was used for a computer simulation of the Santa Maria watershed and design of the reservoir system. The reservoir system cost for the total Santa Maria area of 8,000 acres is $7.0 million, a significant decrease in cost over the conventional system even with the addition of land costs. Water conservation and multiple land use benefits provide distinct economic advantages in favor of the reservoir system that can defray up to 50% of the system costs. (Knapp-USGS)

Identifiers: Flood Control Act, Federal Tort Claims Act.

The defendant United States moved for dismissal of a tort claim by plaintiff homeowners for flood water damage allegedly caused by defendant's

negligence in the construction of navigation aid projects. The court rejected the government's contention that the actions were not maintainable by virtue of the immunity clause contained within the Flood Control Act, and held that the federal government could be held liable if negligence was proven. The court relied upon the Federal Tort Claims Act's more reasonable, liberal, and equitable policy of a general waiver of immunity in the particular circumstances of this action notwithstanding the Flood Control Act, which eliminates federal liability for flood damages. The court permitted plaintiffs to litigate their claim for damages, but placed them under a burden of proof greater than in a normal tort case. (Casey-Florida)

RELIABILITY ESTIMATES FOR A STORAGE RESERVOIR WITH SEASONAL INPUT,
Toronto Univ. (Ontario). Dept. of Mechanical Engineering.
Vit Klemes.
French resume included. Proceedings of International Hydrology Symposium, Sept 6-8, 1967, Colorado State University, Fort Collins, Vol 1, Paper 54, p 414-421, 1967. 8 p, 1 fig, 4 ref.

Descriptors: *Streamflow forecasting, *Reservoir operation, *Reservoir yield, *Probability, *Statistical methods, Safe yield, Runoff forecasting, Water storage.
Identifiers: Reservoir content probability.

Reliability of storage-reservoir operation may be judged from three different points of view. One may consider the number of failures in water supply within a given period, or the total duration of failures, or the deficit of water not supplied to the consumer. According to the criterion adopted, three different characteristics of reliability can be used, in particular, the occurrence-, time-, and quantity-based 'certainty'. While certainty is represented by a single value if an unlimited period of time is considered, it has a distribution in case of finite period. A method is presented for determining the distribution of certainty of any of the three above mentioned types, for a reservoir with seasonal input. The method employs Moran's discrete approximation to a continuous distribution, and Gould's method for determination of the transition probabilities. (Knapp-USGS)

STATE WATER POLICY COMMISSION - POWERS AND DUTIES.

N J Stat Ann secs 58: 1-9 to 58: 1-13, 58: 1-15 to 58: 1-18, 58: 1-24 (1966).

Descriptors: *New Jersey, *Administrative agencies, *Water resources development, *Legislation, Legal aspects, Water supply, Diversion, Condemnation, Project planning, Water sources, Investigations, Dams, Irrigation, Watershed management.
Identifiers: Reports.

The State Water Policy Commission shall have all the powers and duties formerly vested in the Department of Conservation relating to water supply matters, control of dams, flood control, irrigation and water power. The commission shall supervise all public water supplies. The Commission shall complete a study of the water resources of the entire state to allow it to perform its assigned duties. The findings of such study shall be reported to the legislature to the end that a final plan will be formulated for the economical and comprehensive development of the watersheds of this state. Plans for watershed development must provide sufficient details of the developments to be made to allow coordination of such plans. The Commission may require annual reports relative to water diverted for water supply purposes. A quarterly report of the amount of water used by waterworks is also required. The Commission must approve any condemnation of new or additional sources of water supply for projects to supply inhabitants with water. Plans for such projects must be submitted to the Commission for approval. Before such Commission approved water supply systems can begin operation, the work itself must be approved by the Commission. (Sisserson-Florida)
W70-03499

STATE WATER POLICY COMMISSION - POWERS AND DUTIES.

NJ Stat Ann secs 58:1-25, 58:1-26, 58:1-31, 58:1-33, 58:1-35, thru 58:1-38, 58:1-45 (1966).

Descriptors: *New Jersey, *Administrative agencies, *Water supply, *Water resources development, Legal aspects, Watershed management, State governments, Legislation, Diversion, Investigations, Dams, Permits, Consumptive use, Streams, Construction, Impounded waters, Channel flow, Public rights, Diversion structures.

The state Water Policy Commission may order the interconnecting of public water supply systems and require the furnishing of water by means of any such system to another. The Commission shall regulate the construction, maintenance, and removal of structures within streams to preserve the channels of streams and to safeguard the public against danger from waters impounded by such structures. The Commission may enter on any land or water for any investigation authorized by this chapter. This chapter does not limit the powers of existing water works systems to develop their present system. However, approval must be obtained from the Commission for constructing or enlarging dams. The definitional section defines such terms as consumptive use, surface waters and low flow. The Water Policy and Supply Council in the Department of Conservation shall delineate those watershed areas in need of regulation. In such areas a permit shall be required to divert water for other than domestic use at a rate greater than 70 gallons per minute. Such permit shall be issued without a public hearing when satisfactory evidence is provided that the water diverted is not to be consumptively used. Nothing in this chapter shall affect the storage and regulation of the discharge of stored waters to supplement streams. (Sisserson-Florida)
W70-03514

VACATION OR RELOCATION OF WATERCOURSES - CONSTRUCTION OF DAMS.
Pa Stat Ann tit 53, secs 2801-2802, 2815, 2831 (1957).

Descriptors: *Pennsylvania, *Dams, *Channel improvement, *Cities, Channels, Relocation, Legislation, Condemnation, Eminent domain, Watercourses (Legal), Navigable streams, Public health, Local governments, Alteration of flow, Water works, Water supply, Dam construction, Sanitary engineering, Compensation, Condemnation value, Stream improvement, Domestic water, Channeling, Legal aspects.

Any city may by ordinance vacate, alter, or relocate the course or channel of any creek, run or natural waterway, other than navigable streams, when it deems it essential to the preservation of the health and welfare of its inhabitants. The city may enter upon, condemn, and take any property within the city's limits as may be necessary to effect such change. If any such creek, run, or natural waterway is used by and municipality or water company as a source of supply of water, the municipality or water company must first consent to the proposed relocation. Whenever the state allows a city to construct and maintain a dam in a public navigable river flowing through the city to improve the sanitary conditions of the city, power is also granted to purchase, acquire, and appropriate private property for that purpose. If the city cannot agree with the owners of the private property upon the compensation for the appropriated property, any interested party may petition the county court to appoint viewers to ascertain the damages done by such taking. (Schram-Florida)
W70-03521

FLOOD CONTROL.
Pa Stat Ann tit 53, secs 2866 (1957), 2862 (Supp 1969).

Descriptors: *Pennsylvania, *Flood control, *Flood protection, *Assessments, Cities, Legislation, Channel improvement, Dikes, Flood damage, Floods, Streams, Local governments, Construction, Banks, Channels, Bank protection, Stream improvement, Rivers, Public benefits, Floodwater, Taxes, Costs, Cost allocation, Cost-benefit analysis, Benefits, Financing, Legal aspects.

Any municipality may erect or construct dikes, river bank protection, and other flood control works and widen, deepen, straighten or otherwise improve the channels and banks of creeks, streams, and rivers. These improvements may be made either within or without the county in which the municipality is situated. Any two or more municipalities may jointly construct these improvements and may enter into agreements with other public authorities as may be necessary for such purposes. Any municipality may provide for the assessment of benefits against private property located within its corporate limits. No assessment shall be made against private property unless, in the opinion of the board of viewers making the assessment, the property will be benefited by the prevention or lessening of future flood damage. The fact that private property has been damaged by flood from the waters of the stream on which the work is being done shall be conclusive evidence that benefit will accrue to such property. No exemption shall exist because the property does not abut on any improvement or on the stream carrying the flood waters. (Schram-Florida)
W70-03529

BRIDGES AND VIADUCTS.
Pa Stat Ann tit 53, secs 2501, 2504, 2551, 2581, 2611, 2619, 2628 (1957).

Descriptors: *Pennsylvania, *Bridges, *Bridge construction, *Cities, Legislation, Local governments, Structures, Abutments, Piers, Railroads, Rivers, Streams, Highways, Construction, Maintenance, Landfills, Slopes, Condemnation, Costs, Erection, Transportation.

The cities of the Commonwealth may locate and build viaducts or bridges over rivers, streams, railroads, and private property for the purpose of uniting two or more highways. These constructions may be partially within and partially outside of the city limits. The cities may contract with the proper county commissioners, railroad interests, or any other interested parties for the construction, maintenance, or damages, caused by such bridges or viaducts. The cities may enter upon, take, and use private property to construct bridges over streams which separate any portions of such cities. Any city may also acquire any existing bridges that cross streams which divide the city. The municipalities of the state may purchase, condemn, or maintain any public toll bridge crossing any river or stream within the limits of such municipalities. Said cities may contract with county commissioners for the county to pay a portion of the costs of the toll bridges. It is unlawful to erect any free bridges over the Juanita River within one mile of any toll bridge constructed by a Pennsylvania corporation. If a county, however, wishes to purchase a toll bridge to make it a free bridge, it may do so under certain provisions. (Schram-Florida)
W70-03533

OBSTRUCTIONS IN NON-NAVIGABLE WATERS.
Wis Stat Ann sec 60.68 (1957).

Descriptors: *Wisconsin, *Non-navigable waters, *Obstruction to flow, *Streams, Creeks, Legislation, Cities, Navigable waters, Natural flow doctrine, Barriers, Navigation, Riparian rights, Streamflow, Flow, Legal aspects.

Whenever any non-navigable stream becomes obstructed so that the natural flow of water is prevented, the supervisors of the town in which the obstruction is located may, at the expense of the town, remove the obstruction. The supervisors are authorized to enter upon any lands necessary to carry out such purpose. (Casey-Florida)
W70-03536

HIGHWAY TO ISLANDS IN MISSISSIPPI RIVER.
Wis Stat Ann sec 80.15 (1957).

Descriptors: *Wisconsin, *Mississippi River, *Islands, *Road construction, Legislation, Administrative agencies, Access routes, Transportation, Eminent domain, Condemnation, Easements, Right-of-way, Navigable waters, Legal aspects.

An owner of an island in the bottoms of the Mississippi River who is shut out from the bank of the Mississippi River and from a highway by other islands, sloughs, or the lands of others through which rights-of-way cannot be purchased at a reasonable price may present to the supervisors of the town an affidavit which sets out these facts and describes the land. The supervisors shall, in their discretion, give relief under 80.13 of this act which provides for the construction of a highway when a real estate owner is shut out from all public highways. The town shall not be liable for want of repair or for defects in any highway laid out pursuant to this section, nor for any accident or injury thereon. (Barnett-Florida)
W70-03538

GRIMES V POLK COUNTY (PUBLIC RIGHTS IN PRIVATE DRAINAGE SYSTEMS).
34 NW 2d 767-773 (Iowa 1949).

Descriptors: *Iowa, *Road construction, *Drainage systems, *Surface runoff, Flood damage, Local governments, Drainage, Drainage engineering, Drainage water, Drainage effects, Outlets, Water control, Water sources, Judicial decisions, Building codes, Damages, Paving, Right-of-way, Highways, Prescriptive rights, Eminent domain, Surface drainage, Surface waters, Legal aspects, Surplus water.

Plaintiff's equitable complaint stated that in grading and paving a highway, defendant, Polk County, had caused an unlawful diversion of and interference with a natural water course which resulted in an excessive and unusual amount of water being cast upon her land. Plaintiff claimed defendent violated a statute requiring highways to be properly drained before paving is laid. Plaintiff's land was the servient estate in a common drainage project, and the water flowing thereon was from the dominant estate. A dominant estate has a right to discharge surface waters upon a servient estate. The court held that due to a lapse of over twenty years defendant has acquired prescriptive rights to the drainage project drains. Plaintiff knew of these drains when she purchased the land. Defendant has a statutory right to connect with the drainage project and to dispose of surface water on public highways, through private ditches and onto plaintiff's land. Where a former dirt highway is paved without a substantial change in grade, no drainage district must be created. The court held that casting such additional water on plaintiff's land was not a taking without compensation. (Smith-Florida)
W70-03562

OPINION OF THE JUSTICES (WATER AND SEWER DISTRICT LEGISLATION).
253 A2d 309-338 (Me 1969).

Descriptors: *Maine, *Water districts, *Sewage districts, *Public utilities, Judicial decisions, Legislation, Sewers, Governments, Sewage, Wastes, Sewage disposal, Sewage treatment, Flow, Water supply, Water, Rivers, Streams, Ponds, Dams, Reservoirs, Pumping plants, Eminent domain, Condemnation, Water storage.

The Senate of Maine requested the Justices of the Supreme Judicial Court to give opinions on the constitutionality of five bills pending in the Senate. The Court held that constitutional limitations on encroachment upon home rule rights of local governments did not invalidate the bills. The bills generally authorized certain water and sewer districts and companies to begin or expand water and sewer services. The Portland Water District is authorized to transmit, treat and dispose of waste water and sewage. The Harrison Water District is authorized to collect, store, and convey water from any body of water whether on the surface or underground. The Harrison District is also authorized to construct and maintain pipes, dams, wells, reservoirs, pumping stations and other structures necessary to furnish water for public purposes. For these purposes the District may acquire any land or water rights by gift, purchase or condemnation. The jurisdiction and borrowing power of other districts are extended. (Smith-Florida)
W70-03564

DRAINAGE DISTRICTS (ANNEXATION AND DETACHMENT OF LANDS).
Ill Ann Stat ch 42, secs 8-1 thru 8-22 (Smith-Hurd 1956), as amended, (Supp 1969).

Descriptors: *Illinois, *Drainage systems, *Drainage districts, *Boundaries (Property), Legislation, Legal aspects, Drains, Ditches, Assessments, Judicial decisions, Cities, Levees, Storm drains, Outlets, Easements, Structures, Surface drainage, Multiple-purpose projects, Watersheds (Basins), Taxes, Financing, Cost allocation, Construction, Remedies.
Identifiers: Penalties (Civil).

Lands may be annexed to or detached from a drainage district. An owner of land lying outside a district but within the district's natural drainage area may connect his land to any ditch or drain of the district. By making such a connection, a landowner gives implied consent to the annexation of his land to the district. When land outside of a district has been connected to a district drain or when it will be benefited by any district work, the district commissioners may petition the court to annex such land to the district. Owners of land outside a district but within its drainage area may petition for annexation. Notice and hearing requirements concerning petitions are set forth. Land annexed to a district will be subject to assessments for improvements. Owners of land within a district may petition for detachment if their land is not and cannot presently be benefited by any work of the district. The court may detach land from one district and annex it to another. Land located within the boundaries of a drainage district and within the corporate limits of a city may be detached from the district, provided the city agrees to pay the district assessments for the continued drainage benefit to the land. (Keith-Florida)
W70-03565

DRAINAGE DISTRICTS.

Ark Stat Ann secs 21-501 thru 21-586 (1968).

Descriptors: *Arkansas, *Drainage districts, *Levees, *Administration, Benefits, Assessments, Taxes, Damages, Drains, Ditches, Financing, Condemnation, Federal government, Construction, Cost repayment, Administrative agencies, Legislation, Real property, Cost sharing, Maintenance, Erosion, Cost allocation, Cost-benefit theory, Construction costs.

The procedures for establishing a drainage district in Arkansas are detailed. Provision is made for the appointment of a board of commissioners to control each district, and their powers and duties are outlined. A detailed procedure for assessing all property in the drainage districts according to the benefit theory is included. The manner of implementing drainage improvements is detailed with provision for extending the benefits and assessments beyond the drainage district. The procedure for taxing property within the drainage district is discussed and provision made for collection and repayment, and remedies for delinquency and default. Details of financing district improvements are included. A procedure for abolishing unnecessary or impractical districts is set forth. This act shall serve as an alternative means of creating a drainage district; the act does not repeal prior laws. Provisions for maintenance of the drainage district are discussed. A plan of cooperation with the federal government in constructing and maintaining drainage improvements is detailed. Provisions for subdistricts and districts created under special acts of the state legislature are outlined. Penalties are provided for violations of certain sections of this act. (Schram-Florida)
W70-03566

DRAINAGE DISTRICTS (ESTABLISHMENT).
Ark Stat Ann secs 21-501 thru 21-517 (1968).

Descriptors: *Arkansas, *Drainage districts, *Assessments, *Benefits, Legislation, Drainage systems, Drains, Ditches, Damages, Administration, Administrative agencies, Compensation, Condemnation, Right-of-way, Condemnation value, Taxes, Drainage effects, Cost-benefit theory, Drainage programs, Drainage practices, Construction.

Creation of a drainage district may be sought by petition to the county court. Provisions are included for bonding a survey of the proposed site, appointing an engineer, paying expenses, and conducting a public hearing. The appointment of district commissioners and the organization of a drainage board are discussed. The formation of subdistricts is permitted upon petition of three landowners. The appointment procedure for commissioners of subdistricts is set forth. The commissioners are authorized to assess the costs of improvements against all lands, public and corporate roads, and railroads benefited by the drainage system. The commissioners are directed to assess and award damages for injuries to land which arise from project construction. If lands outside the district are benefited, the county court may, after notice and a hearing, extend the boundaries of the district to include these lands. Upon completion and filing of all assessments by the commissioners, notice is to be given and complaints and appeals may be made by affected landowners. If a landowner so requests, damages to his land may be recovered through condemnation proceedings. Procedures for altering the plans for improvements and for reassessing necessary property are detailed. (Schram-Florida)
W70-03567

DRAINAGE DISTRICTS (CONSTRUCTING IMPROVEMENTS).
Ark Stat Ann secs 21-518 thru 21-541 (1968).

Descriptors: *Arkansas, *Drainage districts, *Assessments, *Financing, Drains, Ditches, Legislation, Administration, Administrative agencies, Benefits, Cost-benefit theory, Drainage systems, Drainage programs, Bridges, Construction, Taxes, Tax rate, Sewers, Condemnation, Condemnation value, Width, Depth, Length, Levees, Drainage practices.

Commissioners may extend and improve the drains in their district and may issue bonds to finance

these improvements. Commissioners may make annual reassessments of benefits, provided adequate notice is given to affected landowners. Before assessments for further improvements may be confirmed, a majority of the landowners in the district must petition for the construction of those improvements. The procedures for filing petitions and provisions for notice, hearing, and appeal are detailed. The Commissioners will control the construction of these improvements. Provisions are made for taking bids, soliciting contractor's bonds, and purchasing materials. Landowners may build ditches to drain water from their lands into the public ditches. The ditches may cross the lands of intervening landowners. The district is directed to build bridges over its ditches where they intersect county highways. The Commissioners may regulate the manner of building bridges and fences across any ditch to prevent injury to the drainage system. The Commissioners may construct ditches beyond the district when necessary and may acquire rights-of-way necessary to this construction. The Commissioners may levy additional taxes, with court approval, to maintain the district's improvements. Provisions are made for assessing annexed lands, reassessments, and additional assessments for increased benefits. The district may be extended to include lands served by sanitary sewers connected to drainage ditches. (Schram-Florida)
W70-03568

DRAINAGE DISTRICTS (TAXATION).
Ark Stat Ann secs 21-542 thru 21-550 (1968).

Descriptors: *Arkansas, *Drainage districts, *Taxes, *Tax rate, Financing, Legislation, Cost-benefit theory, Cost-benefit ratio, Administration, Administrative agencies, Assessments, Payment, Construction, Evaluation, Real property, Administrative decisions, Cost repayment, Bids, Interest.

The county court may order a tax levied upon the drainage district to pay improvement costs. A tax so imposed is a lien on all real property in the district, and is assessed proportionately for benefits derived from the district. Procedures for appeal from assessments and for compelling the court to comply with this section are outlined. Provisions are set forth for collection of drainage district taxes. A time limit is set for the payment of taxes and remedies are provided against delinquent taxpayers. Procedures are outlined for the sale of property subject to the drainage district's lien. (Schram-Florida)
W70-03569

CONTROL AND IMPROVEMENT OF NATURAL WATERCOURSES.
Ohio Rev Code Ann sec 755.28 (Page 1953).

Descriptors: *Ohio, *Watercourses (Legal), *Administration, *Eminent domain, Legislation, Local governments, Cities, Sewers, Maintenance, Construction, Management, Natural streams, Developed waters, Water Control, Water rights, Easements, Condemnation, Land, Cleaning, Water circulation, Water conveyance, Administrative agencies, Legal aspects.

The board of park trustees supervises the work of straightening, cleaning, deepening, or otherwise improving any natural watercourse with the city, even if used for sewer purposes. The board may purchase, acquire, or condemn any water rights, easements, or privileges in connection with any natural watercourse within the city and may acquire or condemn necessary real estate. (Powell-Florida)
W70-03580

LEVEES.
Tenn Code Ann secs 70-601 thru 70-623 (1956).

Descriptors: *Tennessee, *Levees, *Financing, *Local governments, Construction costs, Construction, Capitol, Government finance, Interest, Principal, Overflow, Water levels, Flood damage, Administrative agencies, Taxes, Condemnation, Condemnation value, Cost repayment, Compensation, Judicial decisions.
Identifiers: *Bonds.

County courts may issue bonds for the construction of levees to protect potential overflow lands. These bonds must be approved by three-fourths of those voting in a regular election. A selected group of levee commissioners shall superintend the construction of the levee, contract for the work done, and draw bonds as needed, to pay for the construction. The county court shall levy a tax to pay the interest and the principal on the bonds. The commissioners may apply to the court for condemnation proceedings to obtain private land needed for the levees. The county court may then, following proper procedure, decree the land to the county, and a jury shall assess the compensation to be paid to the owner. Commissioners may recieve subscriptions of money or property for the use of the county. Where the value of property is enhanced by the construction of levees, the county may retain such increment of taxes realized from this increased valuation. Funds so realized by the county shall be used to discharge bond indebtedness. (Dearing-Florida)
W70-03581

DRAINAGE AND LEVEE DISTRICTS.

Tenn Code Ann secs 70-701 thru 70-734 (1956).

Descriptors: *Tennessee, *Drainage districts, *Drainage systems, *Levees, Engineering structures, Drainage programs, Drainage engineering, Drainage, Land management, Drainage water, Drains, Natural streams, Water resources development, Natural resources, Stream improvement, Channel improvement, Costs, Cost-benefit theory, Cost allocation, Assessments, Railroads, Expenditures, Surveys, Mapping, Legislation, Legal aspects.

The county court of any county may establish drainage districts, construct any levee, drain or watercourse, and straighten, widen or change any natural watercourse, provided a petition, signed by persons who own a majority of the acreage to be affected, is filed with the court. A preliminary expense fund shall be created by assessing all landowners named in the petition. A disinterested engineer, appointed by the court, shall examine the lands described in the petition and shall submit a report setting forth a plat and profile of the improvements proposed in the petition, together with probable costs and other recommendations he may deem material. Ditches and drains shall be located along the general course of natural watercourses unless there is some special reason to depart therefrom. When any ditch or drain crosses any railroad right-of-way it shall be located at the place of the natural waterway, unless the railroad has provided for or agreed to another place. After the engineer's report has been filed, the court may make a special assessment upon all lands within the proposed district for expenses already incurred. (Smith-Florida)
W70-03582

ESTABLISHMENT OF DRAINAGE AND LEVEE DISTRICTS.
Tenn Code Ann secs 70-801 thru 70-809 (1956).

Descriptors: *Tennessee, *Drainage districts, *Levees, *Damages, Legislation, Drains, Ditches, Watercourses, Channels, Right-of-way, Condemnation, Drainage, Public benefits, Public health, Natural streams, Beds, Ownership of beds, Depth, Width, Compensation, Condemnation value, Legal aspects, Assessments.

Any person claiming damages as compensation for the construction of any improvements of the drainage district must file a claim three days before the hearing for the establishment of such district. If any such claims have been filed, the county court shall not establish the district until the damages have been ascertained by the engineer and viewers appointed by the court. The viewers shall assess the damages that would be caused by establishing the district and report these to the court. Any incidental benefits to the landowner may be considered in estimating incidental damages, but the value of the land to be taken shall be given without deductions. The court shall consider the reported damages in deciding whether the levee or drainage district should be established. If the cost of construction is not too great a burden on the land to be benefited and the improvement is conducive to the public health, welfare or benefit, then the court shall establish the district. After the damages have been ascertained by the court, they shall be paid by the parties benefited by the district. In establishing any district, all necessary lands may be appropriated by condemnation and a right-of-way may be appropriated for any ditch, drain, or watercourse. The natural bed of such watercourse may also be appropriated. (Schram-Florida)
W70-03583

WATERS, DRAINS AND LEVEES (DRAINAGE DISTRICTS).
Tenn Code Ann secs 70-1301 thru 70-1340 (1956), as amended, (Supp 1969).

Descriptors: *Tennessee, *Administrative agencies, *Drainage districts, *Assessments, Legal aspects, Legislation, Adjudication procedure, Cost sharing, Appraisals, Drainage programs, Local governments, Cost allocation, Decision making, Project planning, Administrative costs, Maintenance costs, Taxes, Government finance.

The county court has the power to make a special assessment to pay costs and expenses made after creation of a drainage district. The collection and enforcement of such assessments are regulated. Procedures involving an appeal from an order of court fixing assessments are prescribed. The creation and operation of a special maintenance fund is regulated. Levied assessments are recorded by the county court clerk in the drainage assessment book. The vendee in a voluntary sale of property located within a drainage district must have the sale recorded in the drainage assessment book. Assessments become liens on levied bonds. The procedures for suits in chancery to collect assessments are established. The method of assessing public taxes for tracts partly within and partly without the drainage district limits is enumerated. Specific provisions cover the sale of land for public taxes, the distribution of proceeds from such sale and the right of redemption by the landowner. (Powell-Florida)
W70-03584

DRAINAGE SUBDISTRICTS.
Tenn Code Ann sec 70-1601 (1956).

Descriptors: *Tennessee, *Drainage districts, *Assessments, *Drainage, Legislation, Construction, Drainage systems, Benefits, Cost-benefit theory, Cost-benefit ratio, Damages, Taxes, Tax rate, Administration, Public benefits, Public health.

Any person owning lands within a drainage district, who desires to establish a subdistrict to secure more complete drainage, may file a petition with the clerk of the county court. The petition shall include a description of the lands to be affected by the subdistrict. The bond and all other proceedings, including the assessment of damages and benefits, shall be the same as for the establishment, formation, and construction of original districts and improvements. When established, the subdistrict shall become a part of the drainage system of the original drainage district and shall be under the control and supervision of the district board of directors. Such subdistricts may only be established when conducive to the public health or welfare, or to the public benefit or utility. Any special assessment for the benefit of a subdistrict shall be secon-

dary in lien and in right to the assessments of the original district. (Schram-Florida)
W70-03585

PUBLIC MILLS (FREE PASSAGE OF WATER THROUGH MILL SLUICES).
Tenn Code Ann secs 43-2222 thru 43-2225 (1964).

Descriptors: *Tennessee, *Sluices, *Obstruction to flow, *Flow, Mills, Channels, Watercourses (Legal), Navigable waters, Rivers, Navigation, Boats, Diversion, Water management, Alteration of flow, Legislation, Legal aspects.
Identifiers: *Penalties (Civil), *Steamboats.

No person, upon the pretense of an exclusive right of navigation by steamboat, shall obstruct the passage of water in a sluice of a river on which a mill has been erected so as to affect the profitable enjoyment of the mill. Fines are provided for offenders who divert water from such sluices. Water may be diverted from sluices into the main channel in order to secure the immediate passage of boats, but such diversion shall not last longer than half a day. No person shall obstruct navigation of navigable waters on which exclusive navigational rights to steamboat have been given. (Duss-Florida)
W70-03592

STATE HIGHWAY SYSTEM.

Mo Ann Stat secs 227.080, 227.120, 227.140, 227.150 (1952).

Descriptors: *Missouri, *Highways, *Roads, *Bridges, Legislation, Local governments, Construction. Maintenance, Condemnation, Compensation, Damages, Navigable streams, Drainage ditches, Channels, Channel improvement, Water supply, Power plants, Highway relocation, Road construction, Access routes, Right-of-way, Bridge construction, Excavation, Grading, Administrative agencies.
Identifiers: *Highway maintenance.

Certain bridges built over navigable streams and intersecting state highways are declared to be part of the state highways. These bridges shall be maintained by the state Highway Commission. When necessary for the proper and economical construction and maintenance of state highways, the Highway Commission may purchase, lease, or condemn lands for the purpose of: (1) acquiring bridges or bridge sites and ferries over navigable streams; (2) changing the channels of any stream and providing necessary drainage ditches; (3) acquiring rights of way for locating, constructing, improving, or maintaining any state highway; (4) acquiring water supply and water power sites; (5) acquiring lands to deposit excess excavated material; (6) changing gradients in any state highway; (7) establishing detours in connection with state highway improvements; and (8) eliminating grade crossings. In any condemnation proceeding, the court shall take into consideration the benefits to be derived by the landowner as well as any damages sustained. (Schram-Florida)
W70-03603

INUNDATED HIGHWAYS.

Mo Ann Stat secs 227.270, 227.280 (1952).

Descriptors: *Missouri, *Highways, *Flooding, *Highway relocation, Legislation, Damages, Local governments, Compensation, Hydroelectric plants, Hydroelectric power, Power plants, Flood damage, Legal aspects, Administrative agencies, Construction, State governments, Safety, Negotiations.

Whenever the construction or operation of any water power or hydroelectric project results in the inundation of any portion of a state highway, the State Highway Commission may abandon that portion of the highway. The Commission may then relocate as much of the highway as is necessary. Provisions as to these relocations are detailed. Whenever the construction or operation of any water power of hydroelectric project results in the inundation of any land or highway under the control and supervision of the Commission, the Highway Commission may negotiate and agree to a settlement with the responsible parties. All money received for damages from such settlements shall be deposited with the State Treasurer to the credit of the State Road Fund. (Schram-Florida)
W70-03604

MAINTENANCE OF PUBLIC ROADS.
Mo Ann Stat secs 231.080, 231.090, 231.100 (1952).

Descriptors: *Missouri, *Highways, *Maintenance, *Drainage, Legislation, Roads, Drains, Ditches, Water conveyance, Legal aspects, Real property, Obstruction to flow, Construction, Hydroelectric power, Hydroelectric plants, Powerplants, Flooding, Local governments, Jurisdiction, Compensation, Flood damage, Drainage practices, Drainage engineering.
Identifiers: *Highway maintenance.

The county highway engineer is authorized to contract with any owner of land adjacent to a public road for the purpose of opening any ditch for the drainage of the road. Reasonable compensation may be paid. These contracts shall be in writing and shall describe the lands on which said ditches or drains are situated. These contracts shall be signed by the landowner and recorded in the office of the county deed recorder. Whenever any ditch has been opened pursuant to this section, the road overseer or county highway engineer may enter upon such land at any time to remove any obstructions in the ditch. Any person obstructing these ditches so as to interfere with drainage purposes shall be guilty of a misdemeanor. Whenever the construction or operation of any power or hydroelectric project results in the inundation of roads other than state highways, the proper local officials having jurisdiction of such roads may make a settlement for the damages. All money received shall be credited to the road fund of the county or political subdivision. (Schram-Florida)

DAMS, MILLS AND ELECTRIC POWER.

Mo Ann Stat secs 236.010 thru 236.180 (1952).

Descriptors: *Missouri, *Dams, *Dam construction, *Electric power plants, Damsites, Nonnavigable waters, Ownership of beds, Damages, Flood damage, Public health, Assessments, Judicial decisions, Legislation, Navigation, Fish barriers, Fish conservation, Fish passages, Mills, Milldams, Costs, Dam failure, Electric power, Hydroelectric plants, Overflow, Legal aspects.

Any person or corporation organized to operate mills, electric power works, or other machinery may erect a dam across any non-navigable watercourse if the proposed damsite is located on their land. If such person or corporation owns the land on one side of the watercourse and part of the streambed, they may also erect a dam. The procedures and petitions necessary to construct dams in the above instances are detailed. A jury shall be composed to determine: (1) damages from the proposed dam erection; (2) whether surrounding lands would be flooded; (3) whether navigation and the passage of fish would be obstructed; and (4) whether the health of the neighborhood would be materially affected. The findings of the jury shall be reduced to writing and, if there are objections to these findings, a regular civil trial shall determine the issues. The county circuit court shall grant or refuse the petition for a dam according to its judgment of what would be most reasonable and just under all circumstances. The privilege to erect a dam is subject to the conditions that: (1) all damages and valuations assessed by the jury shall be paid; (2) the court imposed conditions as to obstructing navigation and the passage of fish shall be followed; (3) the dam and other machinery shall be completed within three years; and (4) the dam or machinery when destroyed or impaired, shall be repaired or rebuilt within three years. (Schram-Florida)

APPOINTMENT, POWERS, AND DUTIES OF DRAINAGE BOARD.

Wis Stat Ann secs 88.17, 88.21-88.22 (Supp 1969).

Descriptors: *Wisconsin, *Drainage districts, *Drainage, *Water management (Applied), Drainage systems, Drainage programs, Federal government, Administrative agencies, Water control, Drainage practices, Levees, Construction, Condemnation, Flood protection, Water conservation, Floodways, Legal aspects, Legislation.

When a petition is filed for organization of a drainage district in a county which does not already have a drainage board, the county court may create a drainage board and appoint resident landowners to board membership. The drainage board shall be empowered: to employ engineers and other assistants as advisors in drainage matters; to purchase, or with court permission, condemn lands necessary for construction or maintenance of drainage systems; to level spoil banks or excavated materials for agricultural or highway construction purposes; and to purchase or construct such levees, bulkheads, floodways, or pumping machinery as are necessary for successful drainage or protection of a district. Subject to approval by the court, the drainage board may enter into agreements with the federal government or an agency thereof to permit drainage of land owned by the United States. The board may also obtain federal loans and with state approval enter into contracts with the federal government to accept benefits of federal flood prevention laws and federal water conservation laws. (Kelly-Florida)

ORGANIZATION OF DRAINAGE DISTRICTS.
Wis Stat Ann secs 88.27-88.36 (Supp 1969).

Descriptors: *Wisconsin, *Drainage districts, *Drainage programs, *Administrative agencies, Drainage, Drainage systems, Construction costs, Cost allocation, Cost-benefit analysis, Drainage, Water control, Water management (Applied), Legal aspects, Legislation, Operation and maintenance, Permits, Control.

Owners of more than one-half of the land in a given area may petition for the organization of a drainage district to serve that area. An alternate method permits a majority of the landowners within a proposed drainage district, who own at least one-third of the included land area, to petition for organization of a district. Requirements relating to petition contents and filing procedure are set forth. Special procedures are established where drainage projects will affect navigable waters. The Public Service Commission must consent to the project, and extensive investigations of the proposed project must be undertaken by the drainage board before a permit to proceed may be granted. At any time prior to approval of the creation of a drainage district, a majority of the landowners, or those owning a majority of the land in the proposed district may petition the court to refrain from establishing a district. Following the organization

of drainage district, the drainage board shall proceed to lay out sufficient drains to carry out the drainage project, and shall assess benefits to the affected land, estimate costs and award damages where appropriate. (Kelly-Florida)

DRAINAGE (CONTROL OF WATER ON THE SURFACE: ORGANIZATION AND OPERATION OF DRAINAGE DISTRICTS).
Ill Ann Stat ch 42, secs 12-1 thru 12-24 (Smith-Hurd 1956), as amended, (Supp 1969).

Descriptors: *Illinois, *Drainage districts, *Administrative agencies, *Surface drainage, Drains, Ditches, Spillways, Right-of-way, Condemnation, Easements, Structures, Bridges, Levees, Bridge construction, Highways, Railraods, Culverts, Flow, Flow control, Costs, Pumping plants, Wastes, Pipes, Environmental sanitation, Legislation, Interagency cooperation.
Identifiers: *Natural drains, Penalties (Civil), Fords, Penalties (Criminal).

Landowners within drainage districts have the right to use district drains for drainage of their land. Land within a district has the same rights of drainage as land outside of an organized district, except insofar as the drainage system varies from natural drainage. Landowners may continue to use land occupied by a district right-of-way in manners not inconsistent with the rights of the district. When a district drain crosses a railroad or highway, the district is liable for the construction of bridges or culverts necessitated by such crossing. Lands outside of a district may be included within it when construction of district works protects such lands. Civil and criminal penalties are provided for injuries to district structures and interference with the proper functioning of the district. The district commissioners shall cooperate with other governmental agencies in the exchange of information pertaining to drainage. This act is a consolidation of all previous state statutes relating to the organization and operation of drainage districts. (Duss-Florida)

MUNICIPAL CORPORATIONS (FLOOD PREVENTION).

Ind Ann Stat secs 48-4701 thru 48-4749 (1963), as amended, (Supp 1968).

Descriptors: *Indiana, *Administrative agencies, *Floods, *Flood control, Legislation, Regulation, Administration, Dams, Dikes, Diversion structures, Levees, Flood protection, Water management (Applied), Management, Planning, Costs, Construction costs, Condemnation, Financing, Taxes.

The board of public works of any first class city may adopt a resolution declaring the carrying out of flood control projects to be necessary for the general welfare. The board has the power to: construct dikes, levees, and retaining walls along rivers or streams; remove obstructions in channels; and construct and repair bridges. Other powers relevant to flood protection and water control are listed, and include the powers to: establish channel, bank, and harbor lines on rivers and streams; control the removal of obstructions; and regulate the construction of temporary bridges dikes, spillways, and dams. The board may condemn property needed for flood control purposes. A city and county tax levy to pay for bond issues is authorized. The organization of the Board of Flood Control Commissioners is set forth. The Commission has the power to: carry out flood control projects; construct dikes and levees; provide for disposal of excess reservoir water; and dredge, control or change the channel of streams. The county surveyor controls and manages all levees constructed. (Moulder-Florida)

WATER SUPPLY - SANITATION - DITCHES (ORGANIZATION AND PURPOSES OF CONSERVANCY DISTRICTS).
Ohio Rev Code Ann sec 6101.04 (Page 1953).

Descriptors: *Ohio, *Conservation, *Regulation, *Administrative agencies, Erosion, Streams, Lake Erie, Environmental sanitation, Water supply, Irrigation, Flood control, Legislation, State governments, Water conservation, Erosion control, Reservoirs, Land reclamation, Multiple-purpose projects, Sewage, Sewage systems, Sewage districts, Ditches, Irrigation ditches, Drainage engineering.

Any area or areas situated in one or more counties may be organized as a conservancy district. These districts shall be subject to conditions stipulated in other sections of this act. The following shall be the purposes of these districts: preventing floods; regulating stream channels by changing their dimensions; providing for irrigation where needed; reclaiming or filling wet and overflowed lands; regulating the flow of streams and diverting or wholly eliminating watercourses; providing a water supply for domestic use; collecting and disposing of sewage; and arresting erosion along the Ohio shoreline of Lake Erie. 4B. Groundwater Management

INJECTION WELL EXPERIENCE AT RIVERHEAD, N.Y.,
Baffa (John J.), New York.
John J. Baffa.
Journal of American Water Works Association, Vol 62, No 1, p 41-46, Jan 1970. 6 p, 9 fig, 5 ref.

Descriptors: *Injection wells, *Water reuse, *Recharge wells, Model studies, Reclaimed water, Aquifers, Water yield, Permeability, Recharge, Artificial recharge.
Identifiers: Well clogging, Well performance.

Injection of fresh potable water was studied in the field and laboratory to compare the hydraulic characteristics of the injection mound with the pumping drawdown characteristics. Injection requires establishment of a boundary pressure for entrance of the injection water into the aquifer pores. Injection was accomplished in two ground wells of different design and in two wells contained in a ground simulator tank so constructed as to permit the sampling of the aquifer material opposite the well screen after pumping, injection and redevelopment. The clogging rate of the double-cased well was less than that of the single-cased well by 0.06 ft per day as measured by the water level inside the casing. The initial specific capacity of the double-cased well was about half of the well with the gravel pack, but after fresh water injection and reclaimed waste water injection it was possible to restore its initial capacity by surging and pumping. After reclaimed waste water injection into the single-cased well its specific capacity was markedly reduced and could not be restored. (Knapp-USGS)

FLOW OF FRESH WATER TO DRAINS IN A COASTAL AQUIFER,
Asian Inst. of Technology, Bangkok (Thailand). Dept. of Engineering.
Hung Tao Shen.
Master of Engineering Thesis, No 248, Asian Institute of Technology, 1969. 62 p, 10 fig, 3 tab, 22 ref.

Descriptors: *Dimensional analysis, *Aquifers, *Flow, Drains, Fresh water, Saline water, Piezometers, Withdrawal, Pumping, Pump testing, Boundary processes, Density, Water level.
Identifiers: *Coastal aquifer, Two-dimensional study.

A two-dimensional study was made of flow conditions caused by pumping from a fresh-water aquifer bounded on the lower surface by a stationary fluid of higher density (saline water) and on the upper surface by a horizontal plane having a constant piezometric head. Withdrawal of fresh water was accomplished by continuous pumping from a series of line sinks or drains spaced at periodic intervals in the fresh water area. Pumping produced interface upconing in the vicinity of the line sink. A general rising of the level of the fresh water-salt water boundary resulted when compared to conditions which existed prior to pumping. The results of mathematical analysis describing flow conditions is presented graphically in dimensionless form. (Carstea-USGS)

GROUNDWATER CONDITIONS IN THE RANEGRAS PLAIN, YUMA COUNTY, ARIZONA,
Geological Survey, Phoenix, Ariz.
P. C. Briggs.
Arizona State Land Department Water-Resources Report No 41, Sept 1969. 28 p, 7 fig, 4 tab, 8 ref, append.

Descriptors: *Water resources, *Arizona, *Groundwater, *Groundwater basins, Water wells, Aquifers, Water yield, Water quality, Irrigation water, Irrigation, Water levels, Water level fluctuations, Hydrologic data, Data collections, Hydrogeology.
Identifiers: Yuma County (Ariz).

In the Ranegras Plain, Arizona, nearly all the cultivated acreage and groundwater pumped are within an area of about 200 square miles north of U.S. Highway 60-70 and south of Bouse. The first large irrigation wells were drilled in the plain in 1948. By spring 1949, about 1,000 acres were being irrigated; by 1957 the amount of land being irrigated had increased to 5,200 acres, but by 1967 only 2,800 acres were being irrigated. From 1948 through 1967, about 211,000 acre-ft of groundwater was pumped in the Ranegras Plain. Changes in water level resulting from the pumping have been minor to the present time (1967). Water levels have declined more than 15 ft in only a small part of the area; declines in water level of from 10 to 15 ft have occurred in a fairly large area. The groundwater in the Ranegras Plain contains varying amounts of dissolved minerals and is considered permissible to unsuitable for irrigation. (Knapp-USGS)

policy, Water conservation, Water resources, Legislation, Water management (Applied).

Every person who intends to drill or dig a water well within the state shall annually obtain a state license. It shall be unlawful for any person to drill or dig a water well within the state without being licensed, posting a certificate furnished by the Commissioner of Conservation and filing a 'report of well driller' after the completion of each well. All water well drilling must be supervised and managed by a licensed water well driller. Well drilling licenses may be suspended or revoked for enumerated reasons. The Commissioner of Conservation is authorized to make and publish such rules and regulations as he deems necessary to effectuate this chapter. A Board of Ground Water Resources is hereby created in order to advise and assist the Commissioners in preparation of rules and regulations governing water well drilling. This chapter applies solely to wells drilled for the production of water. Any violation of this chapter shall be a misdemeanor. (Smith-Florida)
